COAL AGE

With which is Consolidated The Colliery Engineer

DEVOTED TO COAL MINING AND COKE MANUFACTURE

ISSUED WEEKLY

VOLUME XIII

January 1 to June 30, 1918

McGRAW-HILL COMPANY, INC.
10TH AVE. AT 36TH ST.
NEW YORK

COAL AGE

With Which is Consolidated
The Colliery Engineer

INDEX TO VOLUME XIII

January 1 to June 30, 1918

EXPLANATORY NOTE

Note—Illustrated articles are denoted by an asterisk (*), book notices by a dagger (†). Titles are often abbreviated. They are indexed under their most important words, or, if no word be distictive, under their first one (except "A," "The," etc.), or under some topical word not found in the title. Authors', geographical and other proper names are also used freely.

Following is a list of the pages included in the several numbers of the volume, by date:

Jan.	5	Pages	1-44
"	12	"	45-86
"	19	"	87-169
"	26	"	170-224
Feb.	2	"	225-272
"	9	"	273-314
"	16	"	315-358
"	23	"	359-398
Mar.	2	"	399-442
"	9	"	443-484
"	16	"	485-528
"	23	"	529-570
"	30	"	571-612
Apr.	6	"	613-656
"	13	"	657-722
"	20	"	723-768
"	27	"	769-814
May	4	"	815-858
"	11	"	859-908
"	18	"	909-952
"	25	"	953-994
June	1	"	995-1042
"	8	"	1043-1089
"	15	"	1090-1138
"	22	"	1139-1182
"	29	"	1183-1222

A

Accident, Blacklisting to prevent. Discussion 29, 74, 212, 260, 302
Accident that never occurred....1073
Accidents in 1917. Fay.... 111
Accidents in West Va.... 393
Accidents occur, When mine....1062
Accidents, Pennsylvania. Notes 521, 822, 897, 1175, 1216
Accidents—What's wrong with the mines? 752, Discussion....1078
Accidents with explosives, Open air....1009
Accounting, Cost, at coal mines. Dilworth... 874
Adams, K. C. Sketch of Frank J. Hayes...*876
Advisory coal committee, Proposed.... 253
Air compressor in a gassy mine (inq.) *759, Discussion.... 893
Air lift, Circulating jacket water by....*824
Airways, Relative size of intake and return. Discussion....32, 160, 258, 299, 387, 558
Akin, G. N., Wyoming, Dist. No. 2 production 1917.... 105
Alabama, production 1917. Nesbitt 88, 647, 745
Alabama, Year's developments. Geismer.. 88
Alaska coal no aid to Pacific Coast industries 865
Alaska, coking coal. Note.... 476
Alaska is still hermetically sealed.... 975
Alaska, Matanuska coal field....379, 1132
Alaska, Nenana, leasing coal land.... 243
Alaska production 1917. Smith.... 89
Alberta, Can., production 1917, Sterling 105, First three months 1918. Note....1084
Algeria, Coal riches in southern.... 876
Alien, Unalienate the....1205
Alloway, G. E. High efficiency at small cost 690
American Assn. for Labor Legislation—Address....1066
American Coal Miner.... 792
American Coal Mg. Co.—Breaks hoisting record....462, 1151
American Inst. of Mg. Engineers. Paper *278 413, 499, *532, 578, *580, *624, 706, *739, *744, *833, *866, *912, 1100
American Soc. of Mech. Engrs. Papers *772, *825, *870
American Zinc & Chemical Co.—Binder for slope car. Mayer....*1044
Americanization, Naturalization vs.... 936
Americanizing the foreigner.... 995
Ampere, E. M. Gathering motors.... 940
Analyses of Japanese coal.... 832
Anderson, D. A. Nova Scotia production 1917 107
Anemometer readings (inq.)....1031
Answering examination questions. Discussion 158, 348
Anthracite allotment fixed....1069
Anthracite. Ash influence on fuel value of small. Philo....*415
Anthracite Board of Mine Examiners—Miners' certificates. Note.... 306
Anthracite, Briquetting of. Frey....*278
Anthracite, Carbon coal briquettes as substitute for.... 236
Anthracite coal breakers, Gravity track systems. Rupprecht....*1063
Anthracite coal stripping. Kennedy *13, *237, *410
Anthracite, Cost of producing.... 623
Anthracite culm, The utilization of. Hachita *446, *791
Anthracite distribution plan 462. Program for current year....1060
Anthracite, Estimated production to April, 1919....1069
Anthracite, Extensive deposit in Japan. Note 78
Anthracite in Penn. Wyoming region, 1917. Haertter.... 198
Anthracite industry 1917. Parker.... 108
Anthracite inspection. Need for.... 206
Anthracite in New England 1917. Wolkins 121
Anthracite in 1917. Resumé. Crankshaw..*191
Anthracite jig control, Automatic....*682
Anthracite land, Value of.... 334
Anthracite, No. for industrial plants....1069
Anthracite Operators, General Comm.—Circular notice 283, Promises action.... 296
Anthracite—Reclaiming culm. Evans....*244
Anthracite—Reese investigation. Note.... 216
Anthracite slush, Briquets from....1054
Anthracite slush, Successful burning of....*1006
Anthracite storage. Goldstein.... *4
Anthracite Stripping. Kennedy.... *13
Antiseptic value of peat....1048
Are we a nation of individualists?.... 426
Arkansas production 1917. Boyd.... 89
Armature oven, Home-made. Virgin....*911
Arnold, C. First aid to injured.... 156
Arnold, P. A. Guide for use with traverse tables 361, A convenient table for draftsmen.... 445
Ash content of coal, Influence of. Discussion 516
Ash influence on fuel value of small anthracite coal. Philo....*415
Ashley, M. Frozen mine-car journals 757, Mining equipment.... 939
Ashmead, D. C. Up-to-date coal mine power plant *48, 232, Modern rectangular coke oven plant *362, Mineral Spring breaker *488, New Plant and mines of Coal Run Mg. Co. *616, Recent dwelling construction in Penn. *726, Mine trackage for motor haulage.... 784

EXAMINATION QUESTIONS.
—Ala. first class—Ventilation, explosion, gases, timbering, 305; timbering, blasting, working, ventilation, moisture..... 350
—Bituminous first-grade—safety, ventilation, duties of mine foremen, electricty, safety lamps 895; safety lamps, ventilation, mine examination, safety..... 944
—Bituminous mine foremen—Duties of mine foremen, squeezes in mines, first-aid, accidents 760; ventilation, mine maps, cost of headings 806; correction..... 849
—British Columbia—Mine gases.....1214
—Gases, hoisting, haulage, ventilation..... 162
—Illinois mine managers—Ventilation, electricity, geometry, blasting, dust 646; ventilation, explosions, gas, connecting two or more mines, 713; ventilation, shotfiring, 985; gases, tonnage per acre, electricity, timbering, blasting.....1032
—Indiana firebosses—Mine gases, explosives, 474; safety lamp, mine gas, first aid.... 519
—Indiana mine bosses—exam. of working places, haulage, duties of fireboss, 215; safety, blasting, protection of surplus powder, accidents 262
—Misc.—Cost of iron to lay track, pumping, barometric readings, gas, water gage, ventilation 85
—Misc.—Form of airway, shaft area, ventilation, safety lamp..... 76
—Misc.—Gases, ventilation, unwatering mine, hoisting, shaft timbering, surveying....1081
—Misc.—Ventilation, haulage 849
—Misc.—Ventilation, surveying, powder, gases, flow of water in pipes..... 604
—Misc.—Wire rope, boilers, safety valve, pumping, mine supplies, first aid, gases.. 562
—Tenn. mine foremen—Ventilation, use of anemometer, timbering, 1129; mine fires, geology, surveying, ventilation.....1174
—Utah mine foremen—Ventilation, safety lamp, working, haulage, weight of iron, gases, 390; correction, 474; ventilation.. 434

COAL AGE

Vol. 13 NEW YORK, JANUARY 5, 1918 No. 1

MUTUAL CAPITALIZING

IN ALL HUMAN AFFAIRS today there is a mighty trend toward mutualism. It is stronger and more resistless than any other single force in the world at the present time.

WHEN the United States drew the sword against frightfulness, her captains of industry were among the first to pledge their loyalty. The atmosphere of misunderstanding between the Government and "Big Business" was dissipated in a day. In its place came the light of a clearer understanding, which showed the mutual interdependence of all classes of industry. Both employers and employees are coming to see that they and their fortunes are indissolubly linked together. Both are getting the vision of a nation that stands for all a man can hold dear, and that depends on their united labors for regular and increased production.

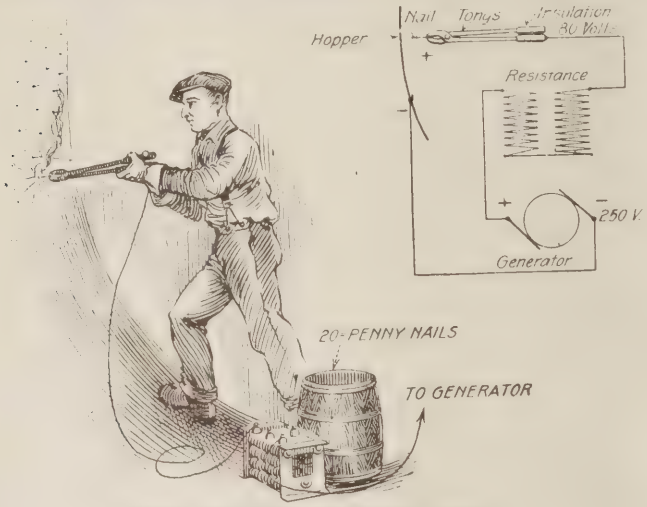
IN THE LIST of such industries coal mining stands first. With his own boy "Over There," the miner, superintendent or manager can see in a ton of coal the making of shells and other munitions, without which his boy is helpless.

THAT PARTY—employer or employee—who retards the progress of any kind of essential business now by reason of unfair pay, unjust treatment, or by strikes, will come squarely before the great tribunal of public opinion; and that court will not be slow in rendering its decision when it remembers the millions of "Our Boys" who are either in or on their way to the trenches in France.

MINING MEN OF AMERICA,

are you fully alive to your responsibilities? Are you awake to the necessity of capitalizing every resource, every circumstance and every condition for the benefit of America? Are you alive to the fact that the best kind of capitalizing is the mutual kind? How can it be done?

First: By remembering that the interests of employer and employee are identical. Profits and earnings are no longer the first consideration, but coal for the country's needs. There should be an end of operators' and miners' representatives rushing to Washington to press their respective claims. Instead there should be hundreds of mining concerns sending telegrams to the president or to the Fuel Administrator, signed by the company and by the men pledging continuous operation for the period of the war.



Second: By individual acts showing appreciation of your duties. How? By putting into actual practice, as nearly as you can, the Golden Rule. Every single act that you perform to bind your men more closely to you is an act of mutual capitalization. The same thing is true of the miner. The time for each and all of us to show a full measure of loyalty to company and nation is here. Your boy, as a soldier, is part of a great military machine, and for the period of the war has practically laid aside his individualism. Can you do less here at home? Can you stay off the job for a day when the loss of each hour's tonnage means a round of cartridges less for the boy "Over There."

THE TIME HAS COME for the mutual capitalization of every coal-mine company in America. Without a clear understanding of this fact, our industry may unintentionally contribute to the lengthening of the conflict. Prussianism must be banished; America's coal men must play their big part wholeheartedly.

IDEAS AND SUGGESTIONS

Homemade Arc Welding Outfit

The Clearfield Bituminous Coal Corporation, of Clearfield, Penn., recently found it necessary to weld wire nails to the inside of a steel hopper at one of its plants. Steel lath were to be fastened to the nails and covered with 1½ in. of cement. Not desiring to purchase an arc welding outfit to do this work, the company's electrician got busy and made one from material he had at hand, this consisting of two pieces of copper

HOW THE WELDS WERE MADE

wire, a pair of blacksmith tongs, insulating tape and a resistance.

The negative wire was fastened to the steel hopper and the positive wire to the blacksmith tongs, and in order to secure the proper voltage a resistance was placed on the positive wire. The voltage being 250 direct current, it was necessary to reduce it to about 80 volts. The handles of the tongs were well insulated. The operator then picked up a tenpenny nail and held it to the side of the hopper, an arc being produced that welded the nail solidly to the side of the hopper.

Imagination and the Engineer

BY E. LLEWELLYN
Lansford, Pennsylvania

It may sound, to the young, rather prosaic to suggest that a cultivated imagination is an absolute essential to a successful engineering career. However, the successful engineer will readily confirm the foregoing statement, and the fair-minded reader will readily acknowledge that all engineering projects which have been successfully completed in a very large measure owe their creation to someone who saw clearly, in his mind's eye, the benefits to be derived from the materialization of the image of his cultivated imagination.

It will readily be conceded that the unimaginative technical man does not, as a rule, attain a position of prominence in his chosen field; and it is largely due to the fact that he is usually content with the world as he finds it. He sees no way of reducing the cost of production of the world's necessities, neither does he see, in his mind's eye, any means of improvement, or refinement, in the production of the product of which he is, in part, a producer.

It may be well to emphasize here that in placing on the market any given product the social labor of many men is required. And in the production of coal the labor of the uncouth, unlearned laborer of a foreign tongue is united with that of men from our foremost seats of learning. Together, they apply their social labor to supply one of the absolute necessities of present-day society.

ENGINEER IS CALLED UPON TO SOLVE MANY PROBLEMS

On the shoulders of the trained engineer of today rests the burden of solving the intricate problems, which are becoming more and more intricate, incidental to the economical production of coal. It is his lot to devise ways and means of applying the labor of the untrained worker so as to obtain more efficient service. Furthermore, to him is assigned the problems of eliminating unprofitable labor, through the introduction of labor-saving machinery, as well as the task of introducing refinements that will enhance the market value of coal.

A survey of the progress made in the production of coal since the inception of the industry reveals many improvements and refinements that have resulted either in reducing the cost of production or in enhancing the market value of the product. And a careful study of their improvements will reveal the fact that they owe their creation to the cultivated imagination of someone who was dissatisfied with conditions as he found them.

A technical man who does not think that the present mode of producing and preparing coal embodies all the refinements and economies that are possible, and who is also given to cultivating his powers of imagination, holds within himself the essentials of a successful engineer. He has but to study conditions as he finds them, and, as he is given to much thought, the logical result is the materialization of an idea that adds to the value of the product or the reducing of the cost of production. Moreover, he enhances his own personal fortune and his services are in greater demand, simply because he has exercised the faculties which all men possess, but very few have wisely chosen to use.

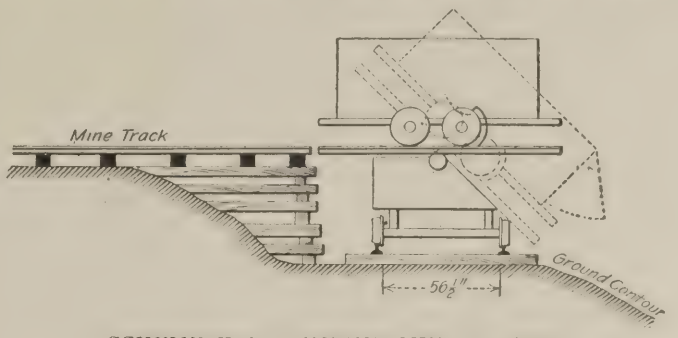
Too often the young engineer is prone to say that "it is all very well to point out ideas, the materialization of which has effected large economics in the production of the world's wealth, but today everything is refined or standardized, and the avenue of opportunity is closed." Right here is where the man who is given to cultivating his powers of imagination sees the further refinement, the further economies that are possible, and gradually rises above the army of men who are "content with things as they are."

It may be pertinent to suggest that before you attack the next task that you are assigned—it matters not in what particular branch of engineering work you are engaged—try to picture in your "mind's eye," in the quiet of your room, the means you will employ to complete successfully the work in hand. Analyze your proposed method of doing the work; ask yourself if it is not possible to improve the usual mode. Try to picture in your "mind's eye" the completed task; ask yourself, "Will it meet all the requirements that are expected of it?" Your superior may ask you, "Why not beat him to it?" The engineer who uses his "mind's eye" to solve the daily problems that beset him, be they large or small, to him will ultimately be assigned the task of solving the great problems, the solution of which requires the mind of a masterman. Mr. Engineer, cultivate your powers of imagination!

As evidence that the coal industry contains a few problems the solution of which will require the powers of imagination of trained technical men, the following are a few thoughts that may be pertinent:

Further refinements in the preparation of coal; reducing breakage of coal in the course of preparation. Further improvements of coal jigs, so that they may become absolutely automatic. Better designed breaker machinery, for the purpose of eliminating the present large friction load. The training of mine employees, so as to effect the reduction of the present day very large cost of maintenance of breaker and allied machinery. Further reasearch work in the mines, to ascertain if possible the most economical size that coal should be sent from the mines to the breaker. Less expensive methods of purifying acidulous mine water for boiler use. More efficient storage-battery locomotives. Less expensive methods of constructing concrete supports and structures. The standardization, in every large coal company, of boiler-room protection, so as to effect more efficient generation of steam and lower cost of upkeep.

Dumping Mine Refuse



By J. A. Smith
Albert, West Virginia

The accompanying sketch shows a simple arrangement for dumping mine waste where the mine opening is but a short distance above water level, and where the usual type of slate dump would not be advisable because of the expense of moving it ahead at frequent intervals. The distance that the slate track is above the general surface level is often so small that the dumping of a few cars would fill the space. The sketch shows how one company overcame this difficulty.

A short track for cars loaded with refuse was laid with a crib 4 ft. or over high, under its end. At the bottom of the crib another track was put in at right angles to the first. This lower track should be at least of standard gage, or more, in order to permit of the truck moving thereon to have a base sufficient to steady the dump. This lower track can be extended in either direction on a level grade around the contour of the hillside.

In the case above mentioned, a truck was built upon this track with its top platform level with the top of the ties under the slate track, and a dump securely mounted thereon. A car loaded with slate coming from the mine is run out over the slate track onto this dump. The truck is then run in either direction, dumped, and brought back into position, the mine car being pushed back onto the slate track.

When the space below the track is completely filled, the track can be swung out to the edge of the fill and

SCHEME FOR DUMPING MINE WASTE

dumping again started. If there is likelihood of more than one car of slate coming out at one time, it will be best to have two tracks extending to the edge of the crib, one for the loaded cars and the other for the empty ones. There is no necessity of extending the crib, as the truck track can be brought out to the edge of the fill by curving the rails near the crib.

Put It Up to Uncle Sam

The railroad fails to deliver coal cars, and a loud outcry comes from the mine; but how about the mine force: Is it ready to do its part when the cars reach the siding? Are the tracks leading to the tipple promptly freed of snow? Are the switches and frogs duly shoveled, salt-sprinkled and swept clean? Are the necessary snow fences erected to make such shoveling less onerous?

The duty of every mine manager is to fill railroad cars as soon as they are run on the siding, and to keep private sidings reasonably clear of snow. For this purpose, organization is needed. Some attempt should be made to get even the miners to help. If some of these men cannot be attracted to this unpleasant but necessary work, a right principle has not been instilled in them.

Then again, are the pipe lines at your mine kept free of frost and the pumps prevented from freezing? Are your airways and shafts kept free of ice? Too often a superintendent regards a severe frost as some inexplicable phenomenon which he was entitled not to anticipate. A high stage in the river, creek or run which destroys a bridge and so shuts off railroad cars, mine cars or supply wagons is regarded as an unfortunate disposition of inconsiderate Providence, whereas the outcome was to be looked for and should have been guarded against.

As good citizens we should be forearmed against these untoward happenings. The total loss of a bituminous mine might injure the output of the United States only inconsiderably, but a mine that inconsiderately receives its allotment and for some reason or other fails to fill it is doing the nation a great disfavor, for it is holding cars idle which another mine would fill if those cars had been pushed into its siding. Put it up to Uncle Sam all the time. Don't let him give you the cars and then fall down when he puts it up to you.

Anthracite and Bituminous Coal Storage

BY HORACE GOLDSTEIN
299 Broadway, New York City

SYNOPSIS — *The storage of coal between the mine and the point of consumption acts as a safety valve for one and a flywheel to the other. The means employed in the storage of anthracite is radically different from that employed for bituminous, since the behavior of the two in storage varies widely. In storing bituminous, care must be exercised not to pile the coal too deep.*

THE coal pile located somewhere between the mine and the boiler room is a safety valve to the consumer and an equalizer to the producer. Without the storage pile, it would not be economical to run the mines at a reduced rate when the demand for the coal is small, as is the case in the summer; and neither could the mine produce sufficient coal to take care of the winter demand except under heavy stress and decreased efficiency.

The price of coal in the summer is usually such that it pays the consumer to lay in a goodly supply to take care of part of the winter demands, and to carry a sufficient amount in storage to tide over strikes, storms and other interruptions in delivery.

All coals are shipped to any of three places: (1) Direct from the mine to the consumer for his immediate needs; (2) direct to the consumer to be stored closely adjacent to the boiler house, or in the storage plant located between the mine and the boiler house; (3) to a central storage where the producer allows the coal to accumulate in large quantities against a demand rate greater than the rate of source supply, or until a favorable market presents itself.

Except for small plants, there are few cases where no provision is made for coal storage of some kind or other. Location of buildings, yard space, fire insurance, etc., have considerable bearing on the amount of coal carried directly at the plant. In some cases it has been known that the consumers have made arrangements with local fuel dealers whereby these dealers carry in their yard a certain amount of coal which is always subject to the call of the consumer. Different arrangements for paying for this privilege have been agreed upon, and the cost thereof is often called a "premium on coal-supply insurance."

Coal-storage systems can be divided into two main classes—anthracite and bituminous. Anthracite coal is comparatively easy to handle; it flows readily and can be piled to any desired height. Bituminous presents problems which require extra attention, and arrangements must be made to suit the particular case in question. Bituminous coal will not flow as readily as anthracite; the lumps are many times larger, requiring larger and heavier equipment, and there is always present the danger of fire from spontaneous combustion. Coal of this kind has been known to fire when piled only 6 to 8 ft. high. It has also been piled 35 to 40 ft. deep without firing, but in cases of this kind it is always advisable to keep the coal moving in and out of storage, so as not to give it much chance to heat.

Any handling equipment for bituminous-coal storage should be arranged so that any portion of the coal pile can be removed without interfering with the rest of the storage. This will permit the digging out and turning over of the coal as soon as heating occurs, and by doing this fires are prevented. With apparatus thus designed, the fires, when they occur, are easily handled and are not a source of much annoyance or loss to the owner. With little care one can observe the coal pile heating and can relieve the situation without any serious results. Oftentimes coal is turned two or three days or even a week after heating becomes noticeable. The following table gives the capacity in tons of 2000 lb. for conical and rectangular piles for both bituminous and anthracite coal:

TABLE I. CAPACITIES OF COAL PILES

Conical Piles						Rectangular Piles		
Bituminous Base Angle = 36 Deg. Tons (2,000 lb.) = $H^3/20$			Anthracite Base Angle = 27 Deg. Tons (2,000 lb.) = $H^3/10$			Bitum. Base Angle = 36 Deg. Tons per Ft. = $H^2/30$	Anth. Base Angle = 27 Deg. Tons per Ft. = $H^2/20$

The storage of anthracite coal can be divided into two systems—conical piling and rectangular piling. Fig. 1 shows a unit element of the conical storage system. As usually arranged for open-air storage, this consists of two trimmers or stocking-out machines, as shown, and one reloader located between them. A storage plant is made up of a number of these groups, and the individual elements can be of the same or varied capacities. With this arrangement it is practicable to put up a plant for storing any desired amount of material. The groups

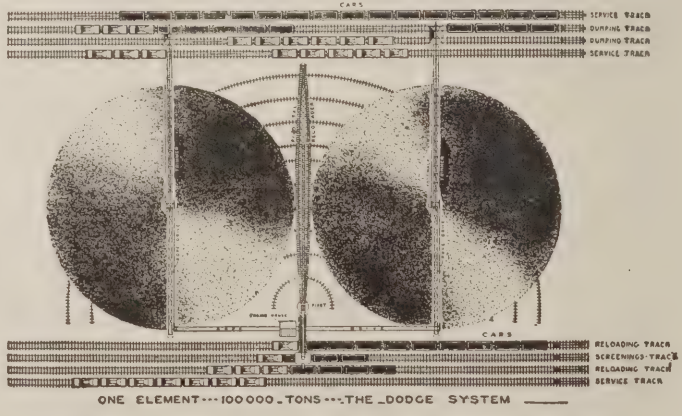

FIG. 1. UNIT OF CONICAL STORAGE SYSTEM

FIG. 2. STOCKING-OUT AND RECLAIMING MACHINES OF THE CONICAL-STORAGE SYSTEM

usually have a capacity of 100,000 to 120,000 tons each. The coal which is received from the mines is dumped into hoppers beneath the railroad tracks and conveyed to the trimmer conveyor, which stores it in a conical pile. In handling anthracite coal, care must be taken to minimize the breakage. Breakage in this kind of coal is a decided loss. All the coal reclaimed from storage is rescreened, and the smaller sizes are sold for less than the larger, while the fines bring very little. Tables II and III give the percentage of breakage in the different kinds of coal for different heights of fall. A careful study of these tables will show the desirability of eliminating degradation as far as possible.

The trimmer conveyor is of the scraper flight type, and is clearly shown in Fig. 2. The bottom of the trough for the carrying run of this conveyor is of the movable ribbon type. The coal which is received from the cars is scraped along the trimmer truss and forms a small pile at the foot similar to that shown under the second trimmer in Fig. 2. The steel ribbon serving as a bottom for the trough is advanced with the ascending apex of the coal pile. This avoids a drop and effectually prevents degradation. The coal discharged from the trough rolls down the side of the pile already formed. This method does away with all dropping of the coal, and has proved to be highly efficient.

A large storage plant of this type which has been in use for some time has a capacity of 480,000 tons, and is divided into eight piles, four on each side of a central railroad system. Each pile has a capacity of 60,000 tons, and the conveying system is capable of stocking out 1800 tons per day of 10 hours, for each of the inclined conveyors, or a total capacity for storage of 14,400 tons per day. For replacing the coal in cars, each reloader has a capacity of 2500 tons per 10 hours, and as there are four reloaders, the reclaiming capacity of the plant is 10,000 tons per day.

The reloader is a long horizontal conveyor, which is pivoted at one end and moves on circular tracks on the ground. The flights of the scraper line come in contact with the outer edge of the base of the pile, since the side of the conveyor trough is open toward the pile, as is seen in Fig. 3. The coal is thus drawn to a central point, taken up an incline, and loaded into cars.

The coal is passed over shaking screens at the head of the inclined conveyor before delivery to the cars. Fig. 3 shows the operator at the pivot of the reloading

TABLE II. BREAKAGE IN DROPPED COAL

Detailed Percentage of Smaller Sizes Resulting from Various Heights of Drop

Size of Coal Dropped	Drop in Feet	Egg	Stove	Nut	Total Prep.	Pea	Buck.	Rice and Barley	Total Small	Total Breakage
Broken	10	3.65	2.11	1.63	7.39	0.77	0.82	1.05	2.64	10.03

conveyor, the scraper taking the coal from the base of pile, and the inclined conveyor taking the coal to the tower for screening and delivery to cars. Fig. 4 shows the arrangement of the machinery at the point of discharge to the cars

Rectangular Piling of Coal

For rectangular piling, a single trimmer conveyor, as shown in Fig. 5, is supported at its base or foot by a traveling truck, its upper end resting upon a track laid on a long girder which is supported by heavy columns and held securely by guy ropes. This trimmer receives the coal from a series of bins built under the railroad trestle, which runs parallel to the trimmer runway. The discharge from the trimmer to the storage is arranged with a ribbon trough bottom, and the pile is thus formed with a minimum of breakage. The trimmer may be moved from bin to bin, and this results in the formation of a solid pile of coal.

In the particular case illustrated, the pile is 83 ft. high at the apex, 342 ft. wide at the base and 1244 ft. long. The capacity is 400,000 tons and may be increased by merely extending the storage area and the trimmer runway. For reclaiming the coal, two reloaders are used (mounted on straight parallel tracks) one on each side of the central overhead runway. These reloaders supply two scraper conveyors which run in a longitudinal underground tunnel; these in turn deliver to a transfer conveyor, and the coal is thus carried to the reloading tower, where it is screened and sized for car delivery.

Fig. 6 shows a "hillside" storage plant. Here the coal is received on a trestle and is discharged through chutes direct to the inclined storage floor. When this storage has received all the coal which will flow to it by gravity, the coal is next diverted from the hoppers to the foot of an electrically-operated traveling cantilever trimmer conveyor, which elevates it and completes the storage pile. The retaining wall at the bottom of the slope is fitted with gates and chutes for reloading. Plants of this nature are the exception, and the location of both discharge and loading tracks as to elevation and centers are such in this particular case as are rarely obtained.

The rectangular pile, in order to secure the large capacities referred to, cannot avoid mixing the different sizes of coal at the junction points of the piles of the various kinds. With a storage pile of about 360,000 tons, the storage cost per ton is somewhat lower than it would be with six 60,000-ton conical piles. The cost of equipment for the rectangular pile can safely be figured, including all material and labor, under normal conditions, at about 90c. per ton, based on the maximum capacity; whereas the six-pile conical system of equivalent capacity will cost about 98c. to $1 per ton. The cost of land, grading, surfacing, drainage, power plant and railroad-track system are included in the foregoing figures. The two systems can briefly be compared as follows:

A. For stocking out, the capacity of the conical system is six to eight times that of the rectangular system, depending on the number of piles. The reloading is

FIG. 4. DISCHARGE FROM CONICAL SYSTEM TO RAILROAD CARS

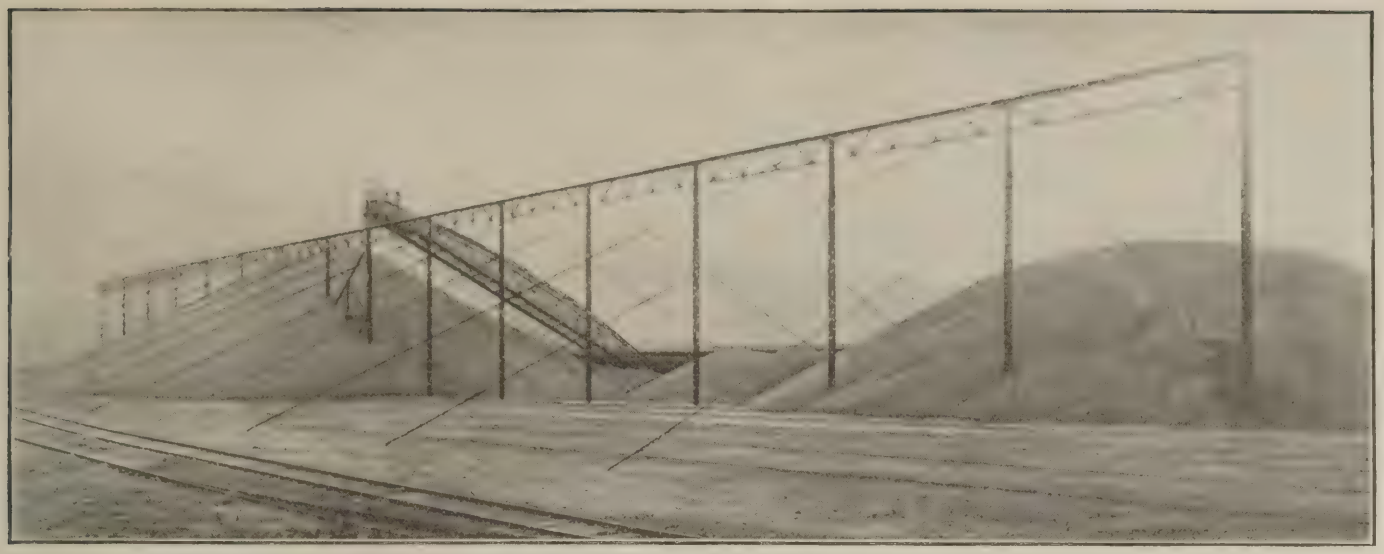

FIG. 5. THE RECTANGULAR SYSTEM OF STORAGE PILING

three to four times faster with the conical pile than with the rectangular.

B. In the conical system each size of coal is separate and can be handled with equal convenience, while in the continuous or rectangular plant the coal must be mixed at the junction to get full capacity.

C. With the conical system no planning is required for placing the coal at the proper location, while considerable foresight must be exercised for the rectangular storage.

D. The conical storage presents mecnanical advantages, such as that no structural steel is in contact with the coal; there is no machinery in tunnels under the storage; and the danger of coal avalanching against the runway columns is eliminated.

E. The conical system requires longer tracking space for both empty and full cars for the same storage capacity.

F. For extending the tonnage of the rectangular storage, little additional expense is involved; the runway, storage space and tunnel conveyors are the items which must be extended.

G. The operating expense of a conical system is higher than that of the rectangular system. In the latter a goodly portion of the coal which is reclaimed flows to the tunnel conveyor by gravity, and the number of conveying units for both stocking out and reclaiming is less.

Most of the large anthracite coal-storage plants which have been erected in the last ten years or more are of the conical type. The greater capacity and flexibility of this storage system warrants the extra expenditure in the initial cost.

Bituminous Coal Storage

For storing bituminous coal, many different kinds of apparatus are used, the type to be chosen depending largely upon the location, the method of receiving coal, the ground space available, etc. It must always be borne in mind that the height of the pile is limited, and

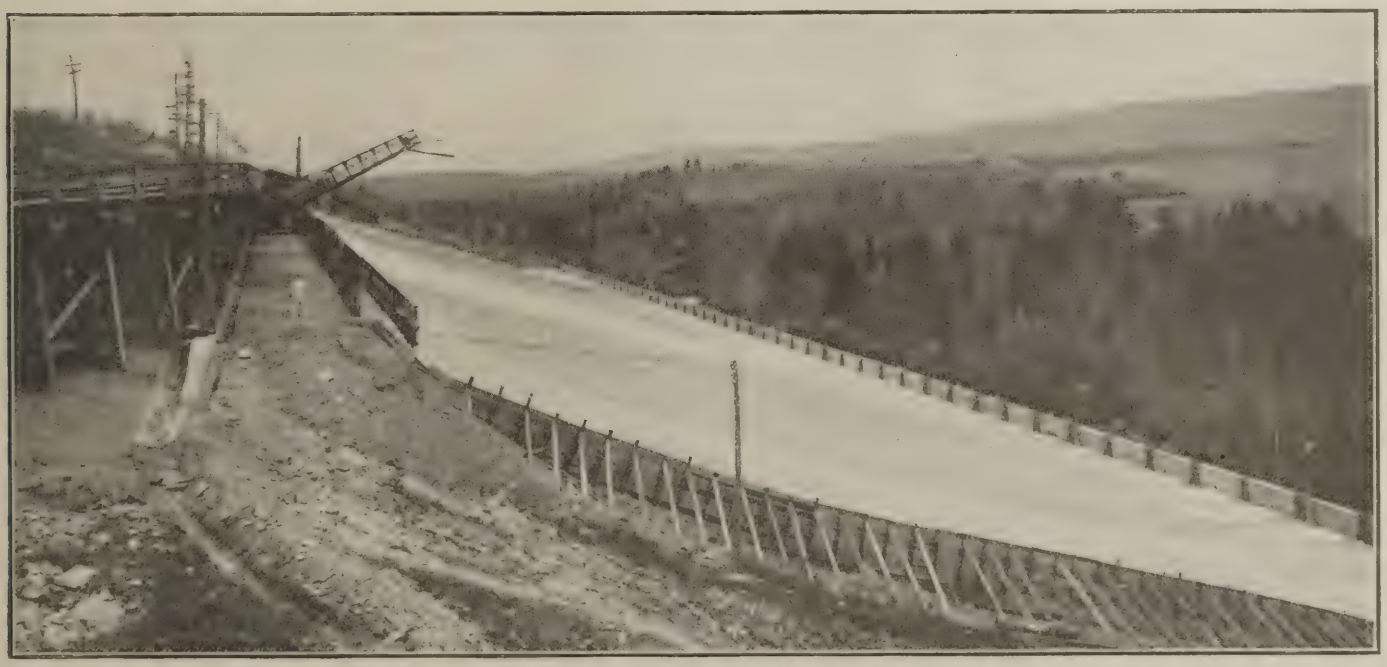

FIG. 6. A HILLSIDE COAL-STORAGE PLANT

for first-class storage installation the machinery must be such that the coal can always be reached under any and all conditions.

A simple and flexible method of stocking bituminous coal for inland storage is with a long-radius locomotive crane traveling on a circular track. The coal is discharged to a hopper and is then taken by the crane bucket to the storage pile immediately adjacent to the circular track.

Cranes for this purpose have been made with 80-, 100- or 110-ft. radius booms, and the coal is usually piled about 25 ft. high. This system is the simplest kind of storage for large quantities of bituminous coal and combines low initial cost with low expense of operating. Often more than one circular pile is made by a single crane, and the storage can be indefinitely increased by adding more trackage and hoppers.

The large capacity in tons per hour of the circular system is made possible because the tracks are so located that the crane bucket can always be brought over the track hopper without making the crane travel. The traversing speed of all cranes is slow, and the movement in this direction should be avoided as much as possible. The circular storage is designed to minimize the travel of the crane and to utilize its slewing or rotating action. The covering up of the circular tracks with coal gives a maximum capacity for a given area and height of pile, but if this is resorted to some of the coal is out of reach of the crane, and this feature is not to be recommended.

Bridge tramways are usually employed where the coal is unloaded from vessels, but the same apparatus can be used to unload from a central railroad hopper. Four electrically operated bridge tramways for handling bituminous coal on a dock are shown in Fig. 7. Each of these has a clear span of 295 ft. and an overall length of 506 ft. Two of the bridges are equipped with 3-ton buckets and two with 4-ton buckets. The run-of-mine bituminous coal is unloaded from vessels and delivered either to storage or through a reloading hopper at the front of the tower of the tramway, to the box or open cars for reshipment. Reclaiming the coal from the stock pile to the cars is accomplished by similar bucket delivery to the reloading hopper. The coal in storage here has been piled as high as 45 ft., but it is not allowed to remain stationary for any length of time.

Fig. 8 shows a bridge tramway arranged so that the bridge can swing over a circular area, thereby commanding a large storage space. This kind of storage can be effected on any fairly level piece of ground having railroad connections. Loaded cars discharge into a track hopper located at the center of rotation, and the

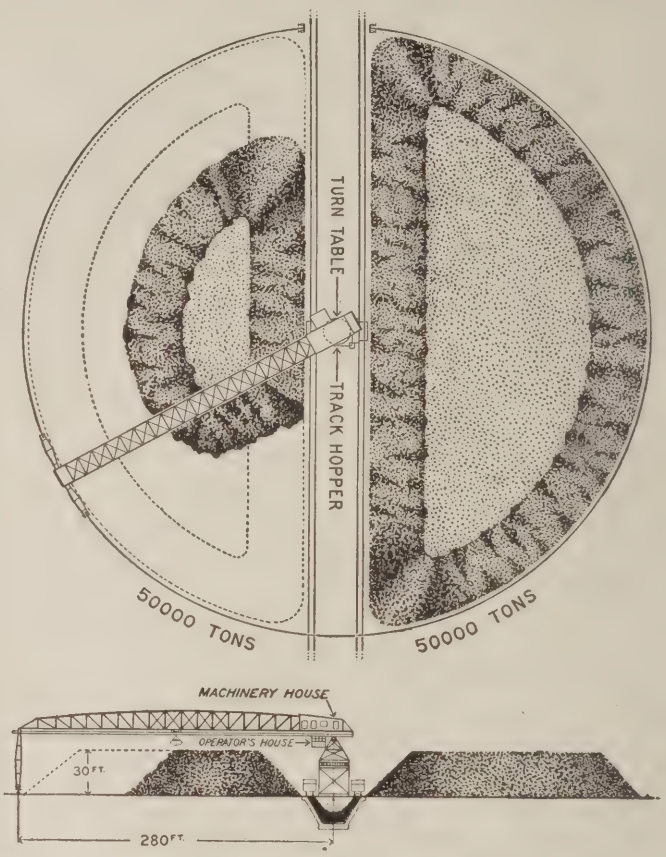

FIG. 8. DIAGRAM OF SWINGING BRIDGE COAL STORAGE

coal is taken therefrom by means of a clamshell bucket and discharged to the storage area. The capacity of the pile so formed is limited only by the span of the bridge and the depth to which the coal can be safely piled.

The labor cost of putting coal into and taking it out of storage has been shown in several instances in normal times to be less than 2c. per ton. With a span of 280 ft., 100,000 tons of coal have been piled, using an arc of swing of the bridge of 340 deg., the coal being

FIG. 7.- ELECTRICALLY OPERATED DOCK TRAMWAYS FOR STOCKING AND RECLAIMING COAL

FIG. 12. GENERAL VIEW OF SWINGING BRIDGE STORAGE PLANT

piled 30 ft. deep. All of the coal in this system is tributary to the bucket and can be taken from one point in the storage area to another, or directly to the hoppers or cars.

In still another system of storage coal is unloaded from boats or barges by means of unloading towers, bridge tramways or locomotive cranes, and then delivered to a cable-car system, which discharges the coal in the storage space beneath the trestle. From this point the coal is picked up by long-radius cranes similar to those referred to above. Coal is reclaimed from the storage by these cranes and delivered to a traveling hopper on the car trestle, and thus returned to the cars of the cable system. The coal from the cable system is reloaded either direct to railroad cars or to barges for reshipment.

For a coal storage plant of any kind, whether large or small, the local conditions and requirements must be studied. Each installation presents problems which should be carefully weighed and considered before the method of handling and storing is finally decided upon. It will be found economical to consult an expert in such installations, as it is only by long experience and careful study of problems of this kind that the best arrangement can be secured.

What Constitutes "Storage" of Coal?

By A. L. H. Street
Attorney at Law, Minneapolis, Minn.

It was recently unsuccessfully sought to bring a coal dealer under the New York Compensation Act, so as to fix liability to the dependent and surviving relatives of an employee who was fatally injured while trimming coal in a storage pocket, on the theory that the dealer was engaged in an industry covered by group 29 of section 2 of the act, "storage of all kinds." (In re Roberto, 167 New York Supplement, 397.)

Apparently, there was no negligence attributable to the employer in this case, and claimant sought an award under the Compensation Act, which creates a limited liability for accidents arising in the course of employment in the industries covered by the law. The Industrial Commission allowed an award on the theory that a dealer in coal bought and held for resale must be deemed to be engaged in "storage." In reversing the Commission's decision, the Appellate Division of the New York Supreme Court said:

"I am unable to see how this award can be sustained, unless we are prepared to hold that every merchant and country storekeeper in carrying his ordinary supply and stock of goods is engaged in the storage business. . . . It is true that the employer was conducting a large and extensive business, but it is not the size or magnitude of the business which is controlling, but the manner in which it is conducted. The method pursued by this coal dealer was precisely that which exists in the ordinary coal yards of the cities and villages of the state. If a merchant purchases a stock of goods in excess of his immediate requirements and holds the same for an advance in price, or for any reason does not expose or offer the same for immediate sale, he perhaps to that extent engages in the storage business within the meaning of group 29. But if his stock of goods is on hand for present sale, I cannot think that such stock of goods is being stored merely because the thrift and prudence of the merchant prompts him to have on hand a sufficient supply to meet the most pressing demands which may be made. In this case it has been found that if the market was right the employer 'would store in the summer coal for their winter supply, which coal would be sold in winter.' Perhaps to that extent and in that respect the employer was engaged in storage within the meaning of group 29. But that need not be determined, because it has no application or relation to this accident. . . . There can be no contention that the employer at that time was carrying a larger supply than the immediate demands and requirements of the business made appropriate. There was not on hand a single pound of coal which the employer would not have sold at any moment to any customer in the usual course of business.

During 1911, with a production of 500,000,000 tons of coal, there was wasted or left underground in such a condition that it will probably not be recovered 250,000,000 tons of coal. This coal could be partly or wholly saved by more careful mining methods or preparation.

Why and Wherefore of the Coal Shortage*

By J. D. A. MORROW
General Secretary, National Coal Association

THERE is an old saying that if you want to be popular, you shouldn't tell your troubles to people. I have the highest respect for that ancient dictum, but we all of us recognize the fact that there is a serious situation in respect to coal in this country today, and it appeals to me that it is a situation in which the people generally are entitled to know about the facts. So I hope you will take what I say not as an evidence of an effort to tell you the troubles that are burdening the coal industry today, but as a word of explanation, giving you an understanding of the causes of your difficulty in getting any coal at times and at other times in getting the particular coal that you need.

I want to read first, as a sort of introduction to what I have to say, a few telegrams that I have here. The first one is from Kansas City:

Twelve companies report 225 cars short today. Seventy-five hundred and fifty tons' loss. Thirteen mines are idle all day, four idle part of the day. This shortage situation is not improving.

Here is a telegram from Indiana, from the secretary of an association there that embraces the mines in that state:

Car shortage, 141 cars; tons lost, 12,100.

Here is one from Somerset County, Pennsylvania:

Report for 12 companies a total loss of 8500 tons.

Here is one from eastern Ohio, the mines that serve directly the great industrial manufacturing territory of Cleveland, Akron, Youngstown:

Thirty-five mines reported this association with railroad capacity of 722 cars received on Monday, the 10th, only 242 cars, causing a loss of 24,000 tons from these mines alone.

That was on Monday, which normally is the best day in the week; the railroads have had a chance over Sunday to accumulate some cars. On Tuesday a telegram from the secretary of that same association reads like this:

Forty-four mines reported this association with railroad capacity of 956 cars, received Tuesday, the 11th, only 270 cars, causing a loss of 34,300 tons from these mines alone.

Here is one from the Fairmont district of West Virginia; this also relates to Monday, presumably the best day in the week:

Out of a total of 120 mines in Fairmont Clarksburg region, reporting today, 55 of them received nothing in the way of cars and are closed down completely. Total tonnage all mines reporting loss today amounts to 33,600 tons.

Here is a telegram received last night, the same territory, Clarksburg, Fairmont, West Virginia:

Out of a total of 121 mines in Fairmont, Clarksburg region, reporting today, 49 of them received nothing in the way of cars and are closed down completely for today. All mines reporting today will close, a total of 33,700 tons' loss because of car shortage and car space.

Here is a telegram from the Pittsburgh district:

Ten hundred seventy-two cars short. Reduction below capacity, 53,700 tons.

Here is a telegram from the Pittsburgh district the following day:

Nine hundred cars short. Reduction below capacity, 40,-250 tons. No improvement.

That gives you an index of the conditions that the coal operators face in their efforts to produce coal to supply the domestic and industrial needs of this country. It goes without saying that a condition of that kind cannot be permitted to continue. The National Coal Association Committee on Transportation went to the Fuel Administrator the day before Thanksgiving and laid the situation frankly and fully before him and said:

The time has come for action. We have talked with one body after another in Washington for six weeks, and we have got nothing but courteous conversation in response; we need something more than that.

Dr. Garfield had been laboring with the same situation in the same way that we had, and he also had been receiving the same kind of responses, perhaps a little more courteous, but not any more effectual in relieving the situation. On that day he wrote a letter to the Chairman of the Committee of Priority, asking for preference in the supply and priority in the movement of cars for coal and coke. No order was issued in response to that letter. No order went into effect until yesterday. At that time Priority Order No. 5, issued by authority of Judge Lovett, did become effective, and that order in plain, unvarnished English is a gold brick. It does not add one car to the supply, nor will it add one car per day to the movement of coal cars. It does nothing, speaking practically, now except to define the situation that has existed for weeks. It makes no change whatever in the situation.

Here are the telegrams setting forth the conditions that must be remedied if mills and factories in this country are to run, if guns and shells and munitions and ships are to be turned out, if houses are to be kept warm. Why, at the first of this week, in the City of Detroit, wealthy people were going around with buckets and wheelbarrows to get a few pounds of coal. It wasn't a question of tons in Detroit, it had got down to pounds. You will have that same situation in other cities if this sort of thing isn't stopped. The coal operators have done all they can do, the Fuel Administrator has done all that he can do, it takes frank recognition of the situation and it takes decisive and immediate action. Otherwise we will have a coal shortage in this

THE primary cause of the coal shortage is transportation, or, rather, the lack of it. It is a long-standing trouble. We have lived with it now for a year. It has been taken up by coal men with railroad operators within that time quite frequently, within the last three or four months almost weekly. The gravity of the situation has been presented in every angle that a coal man could think of to present it. But to date there has not been any effective action to relieve the situation; instead, it is hourly growing worse.

*An address delivered before the Editorial Conference, Washington, D. C., Dec. 13, 1917.

country that is not a coal shortage in the sense that we have ever had it before. We will have people freezing to death because they can't get coal within thirty and forty miles and fifty miles of the mines. There is no excuse, gentlemen, for that sort of thing.

Now, what I say may be interpreted in a certain sense as criticism. If so, you may take it in just that sense. These are simply the facts that we are trying to put before you. We don't wish to appear in the light of criticizing the railroads—we know they have had their troubles, enormous burdens, they have done a great deal in trying to measure up to that situation—but in the classic order of George Monroe, be that as it may, they have failed to measure up to the situation. I think it is perhaps due in part to traditional railroading. Let me define what I mean by "traditional railroading."

Heretofore there has always been an abundance of coal, there has been plenty of coal under movement. Accordingly, operating officials of railroads have got into the habit of giving cars to everybody else first, before they were given to the mines, and have moved everything else on the road before they moved coal. One day this summer, in the Conway yards of the Pennsylvania Railroad of Pittsburgh, there were 343 cars of coal loaded, classified, ready to move to Cleveland and Ashtabula. It was all slack coal. On Monday afternoon, 48 hours later, there were 337 of those same cars standing right there in that yard. Now, that didn't mean that nothing had moved between Pittsburgh and Cleveland and the Lake Front, thousands of tons of freight had moved between Pittsburgh and the Lake Front, but no coal had been moved. Everything else had been moved except coal.

We have tried to say to these railroad men for weeks—for months, in fact—"You can't treat coal that way and get by this winter." But they wouldn't wake up to the fact that we were telling them the truth. They seemed insensible of the change in conditions. Possibly they couldn't do any better than they did, but if so, I submit to you that someone else must do better than they have done.

These are the salient facts of the coal situation today as I have given them to you. The coal operator and the Fuel Administrator are doing all they can to relieve the situation. They need your assistance and your understanding of the situation, your pressure for decisive and effective action.

Mr. Morrow Discusses Several Features of the Coal Situation

Question—I'd like to ask just a little more information about Priority Order No. 5.

Answer—Priority Order No. 5 sets up several different classes of commodities which are to receive preference in supply and in movement. First at the head of the list is railroad fuel. As I said, this order did not change the existing condition, it merely defined it Railroad fuel comes No. 1 on the list. Doubtless that's all right—I am not quarreling with that at all; the railroads have always furnished cars first to the mines that were to be used in loading railroad coal. If the railroads don't have coal, nothing else will get coal, nothing else can move. That portion of the existing situation is, therefore, defined.

Then you have, following down the list of priority, perhaps not in the exact order I mention, but this will serve as an indication, coal for byproduct plants, etc.; you have coal for munitions plants and companies making supplies for the Government, billed direct to the Government agencies. All those preferences must be O. K.'d by agents of the War and Navy Departments. Then you have Government supplies for the Allies, which are billed not directly to the United States Government, but to concerns that are manufacturing or handling goods for the Government. There again that priority order must be O. K.'d by the departments down here. And down fifth in the list I found coal for domestic purposes. You find coal for ordinary industrial use put in along with a great number of other commodities which are the commodities that already have had preference on the railroads because of the blue envelopes, because they were already preferred classes of freight, and for other classification reasons. Coal comes in that category, and even there doesn't receive any additional preference in cars. It gets their only preference in movement, and gets it along with all these other commodities that have all the time enjoyed it.

We figured this thing out; we took the classification commodities on the railroads and compared them with the commodities listed in Judge Lovett's order, and found that it covered 85 per cent. of the freight that moves, that the railroads are now conducting 85 per cent. of the freight they are handling, or are attempting to handle, and it is very useless, under conditions of this kind, to undertake to get the preference for coal out of a situation of that kind, that we must have.

Now, there is no material change in that situation except that it is nailed down hard and fast to priority or to No. 5. There have been some improvements in this respect. Those blue envelopes that were handed out some time ago so generously down here were one of the causes of the transportation tieup on a lot of railroads. That was one of the faults that the Coal Association took exception to. They insisted that there must be a change in that, and I am glad to say that the celebrated No. 22, which made it possible for the Army Department and for clerks in various other departments just to hand out these blue envelopes indiscriminately, has been withdrawn, and in place of it, another has been issued saying that preference of that kind can still be obtained, but it must be sanctioned by some one responsible official in these different departments. It is operated now on that basis. But this change in the physical conditions of the operation of the roads has taken place in the meantime. We kept saying over and over to the roads: "You are operating now under almost ideal weather conditions" (October and November were splendid), "some day a blizzard will hit you people and the thermometer will go down and your operating efficiency will drop over 20 per cent." It has dropped.

There has been no change in this preference or priority which even begins to make up for that 20 per cent. of loss of efficiency. That's the situation that we are facing right now.

Question—I'd like to ask Mr. Morrow just what he meant when he said the time has come for action. Do you mean that a new priority order—I mean, can relief be brought about through existing conditions?

Answer—Yes; it can. If you would give for a brief period of time in a year, priority of movement to the coal that is now standing under load, just simply say this to the operating officials of your railroads—and Judge Lovett has the authority to say it—"Move coal, and do that for three, four or five or six days," you would relieve the immediate pressure for coal. Then give these mines a preference in the supply of cars for 30 days and conditions would be righted. The coal mines today normally require about 350,000 cars, open-top cars; there are some box cars, they load quite a little coal in box cars—we will say 350,000 railroad cars altogether. There must be an increase of about 20 per cent. in that number of cars for a short time to tide us over the immediate difficulty. Now, if 70,000 additional cars are put into this business, in the coal business, it would restrict the movement of freight in other lines, it would restrict the car supply to those other lines. But, gentlemen, I submit

that you had better have the restriction. If that doesn't happen, mills and furnaces will be restricted anyway, because they will not have coal to run with. Now, you can take your choice; you can shut down your plants because you haven't got coal, or you can curtail your production because you haven't got quite enough railroad cars. But you will be able to run at that curtailed figure for a time, and we will get past the immediate crisis, for that is exactly what it is. Now, that is the thing that I meant when I said "immediate, decisive action" could be taken that would relieve this situation. We have asked for that thing, and we need your help in getting it.

Question—Are there sufficient cars for the handling of coal while those cars are kept in motion, or is there an actual shortage of cars so far as mines are concerned?

Answer—Primarily, it is a difficulty of movement. If the movement of coal were speeded up, it would very materially help the supply of cars, but it would be necessary in a brief time to have an added supply of cars for the mines. There are approximately—I may be a little wrong on figures—1,000,000 open-top cars in this country. And, as I said a moment ago, something like 350,000 of those cars would be in the coal business. That leaves a pretty good percentage of cars for other business, and if you took out 70,000 there would still be quite a supply of cars available for other business.

Understand, it is primarily right now difficulty in movement. The roads are not able to get their freight through. Why, passenger trains are coming in here anywhere from four to five hours late. When that is so, what do you suppose is happening to freight trains?

Now, the roads are having plenty of trouble with their engines—something that they are not responsible for. Their shop repairmen have been drafted in large numbers, so that they have not been able to keep up the efficiency of their operating equipment as heretofore. That has been one of their troubles that they have not been able to overcome.

Not Enough Locomotives to Meet Demand

Another thing that is causing trouble (we might just as well talk frankly here) is the fact that a large part of the output of locomotives has been going abroad. That is very generally known. That has made it extremely difficult for the roads to get the additional equipment that they need, or to replace engines that necessarily have been of old design.

I understand that right now there are locomotives that were built for the Russian Government that are standing here, and nobody knows when they will go to Russia, if ever. Gentlemen, I submit that those locomotives can do a great deal more toward winning the war if used here in the United States instead of in Russia. It would take a long time to build the engines we need on our roads; and I think we need a clear understanding by those who are in authority—not an understanding, but a readiness and willingness to take decisive action. We don't need understanding so much any more; it ought to be clear to everybody by this time. What we need is action.

Question—I'd like to ask if the Food Administration got very much relief in the way of extra cars from priority No. 2.

Answer—That's the order that took cars from the road-building material men, and that sort of thing. Theoretically, they ought to have got some cars, but practically the thing worked out just like the pooling has worked out; when the pool was established covering some 20 tons of coal, I remember we sat down to figure out how many railroad cars that would free, would make available, and one of the conditions on which the coal men went into that pool, or they thought it was one of the conditions, was that those extra cars would be kept in the coal business. Well, no doubt the pooling freed the cars, statistics show that, but there isn't a coal man in the territory that supplies the Lakes that could put his finger on any increase in car supply that resulted from it.

Now, when they put in the pools at tidewater ports, the same sort of examination of the situation there indicated a material saving of cars, and doubtless it made a material saving of cars, but that saving was instantly dissipated as far as the coal situation was concerned, because the cars went into other lines of business on account of the distribution. If you will pardon a minute's digression there, let me explain what I mean by that.

Coal men have a fixed rate. You operate a coal mine and an agent of the railroad will inspect that mine and decide that it is capable of producing, say, a thousand tons a day. In other words, that mine is given a rating of 20 cars a day. Other mines are rated in a similar way. In general, I think the rating is fair. We don't particularly quarrel about that. There is no effort on the part of the railroads at all to discriminate or confuse that rate, but the fact remains that a rating is fixed. Now, in times of car shortage, cars are distributed to coal mines on a percentage basis, a percentage of your rating is furnished you. If your mine is rated at 20 cars, and you take a division that may require 2500 cars to furnish the mines on that line with sufficient equipment for a day, if there are only 1500 open-top cars available for distribution to those mines, the mines would get what is known as a 60 per cent. car supply. That is, they would get 60 per cent. of the mine rating; and a mine rated at 20 cars would get 12 cars, and all the others would get cars in the same proportion. Now, that limits strictly the number of cars that can come into the coal business. On the other hand, the number of cars that go to industrial plants is not so limited. Theoretically it may be, but practically it is not. Those plants do not have a rating fixed as the coal mines do. They order cars, and the order is the thing that is discounted; and the alert traffic manager merely increases the order when he knows there is a shortage. Many of those plants, too, are located on more than one railroad. That means that in time of shortage of cars they can get cars from both roads, so that in general the industrial plants are able to take care of these shortages of cars better than the mines. So that while order No. 2 has freed cars in the mining districts, they have very soon got out into other lines, because of the operation of those things.

In Lighter Vein

Attention of Dr. Garfield

A proprietor of a steam laundry in Louisville, Ky., boasted the other day of how he had robbed the coal shortage of its terrors. It was during the period of zero weather and deep snow and gas failure in Louisville, when almost everybody wanted coal at one time. Everything that could haul coal was pressed into service. Many families warmed their homes by coal taken there by basket, bag and automobile. Coal-laden mule-drawn wagons were to be seen on every street headed for somebody's empty coal shed. Many of them went past the laundryman's coal-less place before he achieved the idea. Then he acted. He took a post at the window. Presently laboring mules pulled a ton and a half of coal into sight. He rushed out and flagged the negro:

"I've got 50c. and a big drink of whisky for you," he said, "if you drive into my alley and dump that coal into my bin."

"Like to, boss," said the negro, "but I dassen't."

So the laundryman explained that all the colored man had to do was to go to the telephone, call up the coal man's office and explain that his mules were plumb beat out and could'nt go a step farther, and to wind up by saying: "There's a fellow here says he'll take the coal."

It was a measly thing to do, of course, but it worked; not once, but many times, and it worked with friends of the laundryman to whom he passed the tip. "Fifty cents and a drink of whisky" on a zero day is almost all a negro coal-wagon driver wants to hear about.

Anthracite Coal Stripping—II

By THOMAS F. KENNEDY
Scranton, Pennsylvania

SYNOPSIS—*After the proposed stripping area has been thoroughly prospected, the economic stripping limits must be determined. The economic ratio of overburden to coal may be calculated from the cost per cubic yard of excavating the overburden, the market price of the coal per ton, the desired margin of profit per ton of coal and the cost per ton of mining and preparation.*

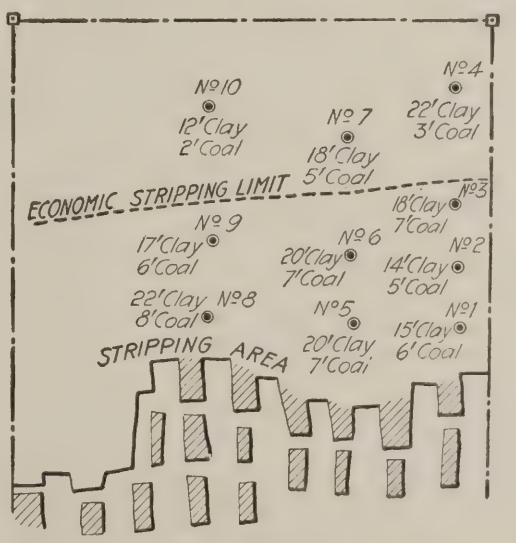
AFTER the prospecting question has been thoroughly studied, the next important step in the stripping problem is the determination of the economic stripping limit. A preliminary general study of the problem should be made by the transitman in charge of the survey of the proposed stripping area. This survey should include the location of boreholes, cut stones and property lines, fence lines, tracks, waterways, probable dumping areas for overburden and all topographical features hinging upon the stripping.

If the surface of the prospected area has a uniform contour and holes are drilled approximately every 50 ft., elevations on each hole should suffice for the calculation of the quantities; otherwise, in addition to the elevation on each borehole, the area should be cross-sectioned every 50 ft. From the field notes taken, the survey is then plotted. For quantity calculation purposes the scale of the plan should be either 1 in. = 25 ft. or 1 in. = 50 ft., the choice of the scale depending upon the extent of the stripping area. Alongside of each borehole plotted, the section of that borehole should be shown. Cross-sections plotted to a scale of 1 in. = 10 ft. show the characteristics of the overburden and the coal measures. These sections enable the engineer to study the problem more thoroughly. After a careful study of the borehole sections, the approximate outcrop of the coal bed is then delineated upon the plan.

To Define Economic Stripping Limit

The question of establishing the economic stripping limit is next in order. To determine this limit no well-defined rule can be followed, because each stripping proposition has its own characteristics. The most important factors affecting the limit are the margin of profit, quantity of coal, character of overburden (whether clay or rock), transportation and preparation of coal and disposal of overburden, methods of mining the coal and removing the overburden, interest on capital invested and depreciation of plant, labor conditions and engineering services. From an approximate calculation of the quantities of overburden and coal, the engineer, after studying the foregoing factors, decides what would be reasonable costs per cubic yard for excavation of overburden and mining and preparation of coal per ton. Knowing the market price of coal and the desired margin of profit, the ratio of overburden in cubic yards to one ton of coal can be determined from the following equation:

$$X = \frac{A - B - C}{D}$$



in which

X = Number of cubic yards of overburden to one ton of coal;
D = Cost of excavating 1 cu.yd. of overburden;
A = Market price of coal per ton;
B = Margin of profit per ton of coal;
C = Cost of mining and preparation per ton.

The market price used in the above equation may be the operator's price direct to the consumer or the retailer. Another factor that may enter into the equation is the transportation or freight charges and other incidental expenses.

It can be seen that the ratio of overburden to coal depends primarily upon the market price, margin of profit, the cost of mining and preparation of one ton of coal and finally the cost of removing one cubic yard of overburden. With the overburden to coal ratio known, the question of defining the economic stripping limit is in order.

In determining the economic stripping limit, I have compiled the accompanying overburden-coal ratio table

PLAN SHOWING PROSPECTIVE STRIPPING AREA

for the various thicknesses of overburden and coal. The table is based upon the principle that one long ton of coal (sp.gr. = 1.378) in the solid, contains approximately 0.96 cu.yd., or by removing equal volumes of overburden and coal, it is necessary to remove 0.96 cu.yd. of overburden for one ton of coal. Considering then the thicknesses of overburden and coal equal to one foot for equal volumes, the ratio of overburden in cubic yards to one ton of coal is 0.96.

By studying the table, it can be seen that for a constant thickness of overburden and a variable thickness of coal the ratio is inversely proportional to the

thickness of the coal, while for a constant coal thickness and a variable depth of overburden the ratio is directly proportional to the overburden thickness. The figures in the left column show the overburden thicknesses in feet, while the top row shows the coal thicknesses in feet. The remaining figures show the overburden-coal ratio of the number of cubic yards of overburden to one long ton of coal.

The table is compiled for coal thicknesses of from 1 to 15 ft., overburden thicknesses of 1 to 65 ft. and sumed. It will be assumed further that it is profitable to remove 3 cu.yd. of overburden to extract one ton of coal. The overburden coal ratio is thus 3 to 1. The plan on the preceding page shows the prospected area of a stripping under consideration.

Referring to the plan, No. 1 borehole shows 15 ft. of overburden and 6 ft. of coal. With a ratio of 3 to 1 and a coal thickness of 6 ft., the table shows that it is profitable to remove any overburden of a thickness up to and including 19 ft. No. 2 borehole shows

OVERBURDEN-COAL RATIO TABLE FOR DETERMINATION OF ECONOMIC STRIPPING LIMIT

$$\text{Ratio} = \frac{\text{No. Cu.Yd. Overburden}}{\text{Per One (Long) Ton Coal}}$$

Overburden Thickness, Feet	Coal Thickness—Feet

Sp.Gr. Coal = 1.378.

ratios of 5 to 1 for coal thicknesses of 1 to 12 ft. and 4 to 1 for remaining coal thicknesses. From the foregoing principle, the table may be worked out for any desired coal and overburden thicknesses or ratio.

For any other specific gravity this table of ratios may be used by applying the ratio of the new specific gravity to the one used in the table. The greater specific gravity gives a greater ratio, while a smaller one gives a smaller ratio.

To show the application of the table, a problem in determining the economic stripping limit will be as- 5 ft. of coal and 14 ft. of overburden, so that with a ratio of 3 to 1, the table shows that it is profitable to remove overburden up to and including 16 ft. No. 3 borehole has 7 ft. of coal and 18 ft. of overburden, so that 21 ft. of overburden might be removed profitably. No. 4 borehole has 3 ft. of coal and 22 ft. of overburden, but the table shows that with a ratio of 3 to 1 only 9 ft. of overburden can be stripped profitably. The economic stripping limit then lies somewhere between No. 3 and No. 4 boreholes. This limit is found by interpolating as follows:

There are differences of 4 ft. of coal thickness between No. 3 and No. 4 boreholes and an overburden thickness of 4 ft. It is assumed that the coal thins out gradually from borehole No. 3 to borehole No. 4 and likewise the thickness of the overburden increases gradually. By interpolation midway between the boreholes, there are thicknesses of 20 ft. of overburden and 5 ft. of coal, so that with the ratio of 3 to 1, the table shows that only 16 ft. of overburden can be removed profitably. Again, by interpolation, one-fourth the distance between the boreholes, there are thicknesses of 19 ft. of overburden and 6 ft. of coal, and the table shows that 19 ft. of overburden can be removed profitably to mine the 6 ft. of coal, so that the one-fourth point between the boreholes locates the economic stripping limit. The same principle is followed out in locating other points upon the stripping limit line.

In determining the location of the stripping limit, of the overburden, the slope of excavation should be considered. General practice allows 1½ and 2 to 1, slope for clay and sand, and ½ and 1 to 1, slope for solid rock or shale.

(To be continued)

Some Interviews

This One with a Mining Town Parson

On the last day of my campaign for pledges toward the soldiers' Y. M. C. A. fund, I had the most interesting and suggestive interview of the campaign. Could I have had the benefit of it in the beginning of my canvass, my efforts would undoubtedly have borne better fruit.

The speaker was a mining camp preacher whose promised salary was so small that the earnings of his son, a trapper-boy, alone insured credit at the company commissary. As a matter of fact, the parson rarely collected to exceed one-half of the amount promised him by his flock.

Knowing all this, I had decided not to ask him for a pledge; but I ran across him unexpectedly in the timekeeper's office and felt that I might embarrass him if I ignored him in the presence of the timekeeper.

To my question, "Would you like to make a contribution?" he promptly replied, "Most certainly; isn't this my war?"

One remark led to another, until finally he gave me this: "Do you know, I believe that we cannot win this war until every last man realizes that this war is a personal matter and that as such it requires maximum personal effort; by effort I do not necessarily mean sacrifice.

"Ask the next man that you meet to tell you what he has done to help win the war, and you are more than apt to embarrass him; he may not be a slacker, slackers are not in the majority by any manner of means, but somehow he doesn't seem to understand that the things that he might do could affect the result of the conflict. 'What possible effect could one or two more tons of coal have on the final result, anyway,' he says to himself if he is a coal miner; and men in the other occupations have similar views.

"The inability of the average man to realize the importance of his 'bit' toward the successful conduct of the affairs of his town, his state, his country, and his world, is positively pathetic. Preachers have always realized this, but the war is bringing it home to many other men; before the end it will probably be brought home to all men.

"Take the 'white slave' evil, or the liquor evil, or the curse of grafting politicians, for illustration. How long could any of these things exist if every one opposed to them would make some effort to stamp them out? Ninety per cent. of our population, at least, are bitterly opposed to these things, and that 90 per cent. could easily stamp them out for all time in a few weeks if they made the effort; still year after year these evils continue to take their frightful toll. Mr. Average Man shrugs his shoulders when he sees them mentioned in his paper and then promptly turns his attention to the next column, and the thing passes from his mind.

"And in that way Mr. Average Man is helping to win this war up to the present time; he pores over the press dispatches, sighs, shrugs his shoulders, and then goes about his business.

"I have talked to our mine superintendent, to our office men and to our miners, and they all admit that the war is a terrible thing; still they don't act as if they realized that it is such a terrible thing. Of course, when their sons begin to come back maimed and crippled, while still others go to the land 'from whence no traveler returns,' things will undoubtedly be different; but in the meantime what a price to pay for indifference.

"There is one consolation; think of the kind of government we will have when this war makes everyone realize his personal responsibility toward his city, his state and his country, a thing that teaching and preaching have both failed to do."

Correspondent "Over There" for McGraw-Hill Papers

Robert K. Tomlin, Jr., managing editor of *Engineering News-Record*, sailed recently for France to serve *Engineering News-Record*, and the other papers of the McGraw-Hill Company, Inc., as special correspondent at the front. Mr. Tomlin was graduated from Harvard University in 1907. During his college course he served for two summers as assistant in the surveying and railroad field engineering of the Harvard Engineering Camp at Squam Lake, N. H. After graduation, he entered the employ of the Pennsylvania R.R. on the tunnel work in connection with the Pennsylvania Station in New York City. He left this work to go to the New York Board of Water Supply, and was stationed with the Northern Aqueduct Department at Poughkeepsie, New York.

His journalistic experience dates from March, 1909, when he became assistant to the editor of the *Engineering Record*. He was subsequently made associate editor, in charge of the municipal and sanitary field, and in 1913 was promoted to managing editor. When *Engineering News-Record* was formed last April by the consolidation of *Engineering News* and the *Engineering Record*, Mr. Tomlin was made managing editor.

Wastes of Coal in the United States

With the hope of quickening the campaign for the conservation of fuel during the war, and in order to get the problem generally before those who are immediately interested, the Bureau of Mines has reproduced an article by David Moffat Myers, member of the American Society of Mechanical Engineers, on "Preventable Waste of Coal in the United States; with a Consideration of Alternative Methods of Its Elimination." This article was presented at the annual meeting of the Society in New York, Dec. 4 to 7, and is here published in part.

AS A means of far-reaching economy, the Government of the United States should at this time apply intelligent and direct-acting efforts to the conservation of fuel at the industrial plants which are responsible for its greatest consumption. It is unnecessary here to show proof that coal is wasted in vast quantities in the boiler furnaces of many plants, to feed which it is mined and distributed at a high and ever-increasing cost of labor and material.

The mining and distribution of coal have been placed under the supervision of the War Coal Board in order more nearly to meet the crying needs in these directions, to use the railroad facilities more efficiently so that the present car shortage may be minimized to the greatest possible extent, and to apportion the coal in quantity and to uses deemed most expedient.

While this organized effort to bring about efficiency in the production and distribution of coal is being made, no parallel measures have been adopted to bring about a normal and practicable efficiency in its use. The hundreds of large plants which are consuming fuel wastefully, in many cases more wastefully and carelessly than ever before, are directly and needlessly causing a large fraction of the existing car shortage. They are overloading the already strained capacity of the railroads; they are rendering slower and more difficult the transportation of food and other vital commodities, and in short they are simply counteracting the measures of efficiency in production and distribution which have elsewhere been established.

Preventable Waste of Fuel

The preventable waste of fuel in the boiler furnace of one steel mill amounted to 40,000 tons per year, which at $5 a ton would cost $200,000. This was a comparatively modern plant. The efficiency of boilers and furnaces in a 14-day test was 55 per cent. The load factor was unusually favorable to high efficiency and could readily be raised to 70 per cent. or over. This is only one example, and there are many more extreme cases. In one hand-fired plant the evaporation was raised from 6 to 9 lb. in a few days of instruction, and continuously kept close to this higher mark with the help of coal and water measurements which were inaugurated. The saving was due exclusively to instruction and consequent better operation.

The saving or wasting of one-fourth of the coal consumption of any industrial plant depends entirely upon the efficiency of its operating management. Let me emphasize that this fraction of the consumption relates exclusively to the boiler plants—that is, the production of steam—and does not include the large economies possible in distribution and use.

For well-known reasons the boiler plant offers the more lucrative field for producing economies, and these with a minimum of alteration in physical equipment. Under present conditions a plant which carelessly operates at an efficiency of 40 to 50 per cent. receives from the Government the same consideration in the delivery of coal as the one whose efficiency is 70 to 75 per cent. This obviously is unfair as well as wasteful. The Government hands over, say, 200,000 tons of coal a year to a plant owner, but asks for no account as regards its consumption, nor any questions as to the amount of steam it is made to produce. There is nevertheless an equivalent amount of steam this fuel is capable of generating, and it can and should be made to produce that quantity.

Conservation Methods

The object of this paper is to open a discussion which it is hoped will ultimately lead to the formulation of definite recommendations of means for the reduction of the present great preventable waste of fuel in our industries; to direct such means principally toward the elimination of that portion of the present waste which is due to faulty, careless and uninformed operation of plants; to forward these recommendations to the proper governmental authorities as an official communication of this society, and to offer to the Government the services of the society for the organization, furthering, and, as far as possible, the execution of the plan which may as a consequence be adopted.

In general, there are two plans of operation worthy at least of consideration. One might be termed the autocratic method. This would involve the use of authority to compel coal consumers to execute such measures of economy as the proper authorities might prescribe for any given case. Limits should be set as to expense to the user. Such limits might be in terms of a percentage of the present yearly coal bill. Alterations to be directed chiefly, as previously implied, to purely operating improvements. Many objections would probably be made by consumers against this plan, but once in effect the majority would no doubt realize its pecuniary advantage to themselves. But its tendency may be too strongly opposed to democratic principles.

The other plan would be largely an educational one, in which patriotism and efficiency would furnish the motive forces required.

The teaching must be accomplished with the utmost simplicity and directness. Above all it must be in such form as to be readily comprehended and applied. This is a big task, but these things should and can be accomplished.

The requisite information must reach the owners and managers of industries, and there must be simple instruction sheets for the engineers and firemen. The vital importance of daily accurate records of coal and

water must be taught and information given regarding practical appliances for automatic measurements of both.

Blank forms might be sent in advance to plant owners in order to be advised by them, first, whether they would be willing to coöperate with a governmental organization offering to assist them in reducing their coal consumption, and second, to obtain such data as to size, type, equipment, operation and fuel consumption of the plants as would enable a classification which would permit a Government board of experts to send such instructions as would include the information needed for any one class of plants.

This work would be greatly aided by a staff of experts ready to visit plants when so requested by owners and make investigations and recommendations and keep in touch with the progress of economies. Included in such a staff should be men intimately familiar with practical operating economies whose duties would be the delivering of lectures or talks, which should be planned so as to reach directly not only managers and owners of the industries, but also the chief engineers and firemen of the boiler plants. This feature of the plan, by itself, would undoubtedly result in great savings.

The United States Bureau of Mines has for a number of years engaged in obtaining and disseminating scientific information regarding the mining and consumption of coal, and the results of the work have been of great value to technical engineers who are able to use and apply it. It is evident that we now require an extension of the idea of education, but in such form as directly to affect the men who run the boiler plants of our country, for in their hands is the saving or wasting of one-fourth of our fuel supply.

Six hundred million tons of coal were mined in the United States in 1916. If we assume only one-half of this to have been used for our industrial boiler plants, then a quarter of the coal used under boilers amounts to 75,000,000 tons per year. It is worth while to save this fuel by preventing its waste. This quantity of coal represents the use of 1,500,000 fifty-ton freight cars.

Individual Price Differential

At the present time there is considerable agitation on the part of some interests in the coal trade against the differential of 75c. allowed the individual shippers above the company prices for anthracite coal at the mines, as fixed in the Presidential orders of Aug. 23 and Dec. 1. The chief objectors are the retail dealers. They have now been able to convince the fuel committee of one city to such an extent that this committee has made an appeal to the National Fuel Administration for the repeal of this differential.

The chief argument of the retail men is that the differential prevents uniformity of retail prices. But the question at once arises, When did the retailers become such sticklers for a standard retail price? In ordinary times in most of the larger cities there has always been a wide variation in prices, according to the locality in which the dealer was located. This was particularly so in those cities where the price-cutting element among the retailers had for years prior to the present stressful times made the matter of a uniform price absolutely impossible.

Now, as to the independent shippers there are many reasons why an increased price is justified, important among which is the fact that most of their operations are on property owned by the larger producing companies and leased on a royalty per ton basis. The coal beds on this land are usually thin and difficult of operation, and for that reason the larger companies are satisfied to have them operated by individuals rather than go to the expense of taking out the coal themselves. Thus it can readily be seen that in addition to the royalty, the individual operator is put to the further expense of difficult and costly mining.

Then, again, many of the individual operations are now no more nor less than mines that have been abandoned years ago by the companies as unprofitable, yet are still made to produce a fair tonnage by "robbing" pillars. This, in addition to being dangerous, is also expensive, and an expense which must necessarily be added to the cost price of the coal.

Operate at a Loss in the Summer

In normal times the individuals operate practically at a loss in the summer time, when the demand for coal is at its lowest ebb, and in order to keep going are compelled to market their output at prices much below those of the companies, taking a chance of recouping their losses by selling coal at a premium in the winter season, when certain sizes are in strong demand. Even under this method of operation there have been years when the individuals have barely come through with a clean sheet on the proper side of the ledger. Many of them in the past have been enabled to offset their losses by handling bituminous coal on a brokerage basis and thus utilizing their sales forces in carrying two lines. Now this is all a thing of the past, as there is no bituminous coal to be had by the independent houses.

Another factor that enables the big companies to sell at a lower circular price than the independents is the immense and rapidly increasing tonnage of washery coal being sent to market by them. This is all coal that was thrown away years ago as waste, yet is marketed today at the full circular price. Money derived from its sale is thus practically clear profit with the exception of the labor cost entailed in sizing it for market. All this material was mined years ago, and its cost was actually covered in the sale of marketable sizes at that time.

Coming Meetings

American Wood Preservers Association will hold its annual meeting Jan. 22-24, 1918, at Chicago, Ill. Secretary, F. I. Angier, Baltimore, Md.

United Mine Workers of America will convene at Indianapolis, Ind., Jan. 15, 1918. Secretary, William Green, Merchants National Bank Building, Indianapolis, Ind.

National Retail Coal Merchants' Association will hold a convention Jan. 8 and 9 at Auditorium Hote, Chicago, Ill.

American Institute of Mining Engineers will hold its annual New York meeting Feb. 18 to 21, in the rooms of the society, 29 West 39th St. Secretary, Bradley Stoughton, New York.

Explosives Regulation Sign

War legislation is daily adding to the complexity of duties of the average American at our mines and in our industrial plants. Section 16 of the new Explosives Act stipulates that all premises whereon explosives or ingredients of explosives are stored shall be plainly and conspicuously marked with a sign reading "Explosives, Keep Off."

Special emphasis is laid on the fact that this act applies to all ingredients of explosives as well as to the

explosives themselves. Failure to comply with the conditions is severely penalized, and inspectors are instructed to enforce the provisions strictly. The illustration shows a danger sign made by the Stonehouse Steel Sign Co. These are handled by the Mine Safety Appliances Co., of Pittsburgh, Pennsylvania.

The sign is made of steel and is in black, red and white. It has been approved by the Explosives Department of the Bureau of Mines as meeting the requirements of the Explosives Regulation Act.

Christmas at Glen White, W. Va.

Christmas joy and good will came in huge chunks to the residents of Glen White, W. Va., on Christmas Day. By the time the clerical force and delivery wagons of the E. E. White Coal Co. had finished their happy labors, not a family in the pretty mining town was without a fat turkey, all the necessary adjuncts, and a snug bit of cash to spare.

As has been its custom for years, the company presented each family with a turkey, all the children with candy, nuts and fruit, and this year added to the generosity for which it holds an enviable reputation by presenting each employee with a brand new five-dollar bill, together with a cash bonus of one dollar for each year of service with the company. The cash bonus was the fourth paid out this year and netted some of the oldest employees nearly a half hundred dollars.

Prominent in the celebration of the Christmas anniversary were entertainments in both the white and colored departments of the public schools. The dedication of a handsome church completely finished and equipped, with up-to-date heating and lighting facilities, presented by the company to the congregation of the First Baptist Church (colored), was a fitting testimonial of the good will of a generous coal-mining company to its numerous loyal and faithful employees. In order to do their part toward relieving the national coal shortage the employees of the E. E. White Coal Co. were idle on Christmas Day only. They resumed work on the morning of Dec. 26.

The E. E. White Coal Co. was by no means alone in the generosity shown toward employees. Many operators, both in the anthracite and bituminous fields, in additions to turkeys and other good things made gifts of clothing to needy ones.

Some Figures on Coal Movement

Recently compiled tables showing the number of loaded coal cars from mines on the Norfolk & Western Ry. disclose some interesting comparisons. It is the opinion of men familiar with conditions in that region that the large falling off is due more than anything else to the inability of connecting lines to handle properly the cars delivered to them. This is particularly true in the West, where yard and other facilities have not been expanded to keep up with the increase in traffic. It follows also that the shortage of sidetracks and of motive power on the Norfolk & Western itself has had its bearing. Only a small part of the difficulty is due to any shortage of labor at the mines in question. The figures are significant:

EQUIVALENT CARS (100,000 LB.) OF COAL LOADED ON NORFOLK & WESTERN RAILWAY

District	Comparison of First Eleven Months 1917	1916	1917 Increase	1917 Decrease
Pocahontas	303,736	323,688	.....	19,952
Tug River	81,465	92,639	.....	11,174
Clinch Valley	26,150	28,768	.....	2,618
Kenova	16,510	20,681	.....	4,171
Thacker	95,890	99,608	.....	3,718
Total	523,751	565,384	.....	41,633

Decrease, 41,633 equivalent cars = 2,081,650 net tons.

Apportionment of Freight to Coal

Experience has shown that in the United States the normal balance in transportation which brings about a maximum of production with maximum economy occurs when out of every 100 tons of originating freight approximately 56 tons are unmanufactured mineral products and 44 are manufactured products, foodstuffs and other commodities, and when of the 56 tons of mineral products 35 tons are coal. Of these 35 tons of coal the railroads themselves consume about 12 tons.

The present balance of transportation is a great reduction in the proportion of the cars furnished for the transportation of coal. The railroads, however, are consuming their full quota of coal, so that while under favorable and natural conditions 35 tons of coal would be moved, out of each 100 tons of freight, there is now being moved very much less coal. The entire coal shortage is thrown upon the industries of the country and the domestic users, who, instead of having a coal supply equal to two-thirds of the total coal movement, are reduced to a small and continually diminishing ratio, and this in a time when every effort is being made to stimulate the industrial effectiveness of the nation.

The commission believes that the coal industry is paralyzing the industries of the country, and that the coal industry itself is paralyzed by the failure of transportation.—*Federal Trade Commission.*

Dodson Coal Co. Not to Renew Lease on Morea Colliery

With the close of the year 1917, the 30-year lease of the Dodson Coal Co. on Morea Colliery, with an annual shipment of 250,000 tons, expires, and the colliery is being taken over by the New Boston Land Co. It will be operated in conjunction with the New Boston Colliery as one operation.

The taking over of this colliery by the New Boston Land Co., closely allied with the Mill Creek Coal Co., operating the New Boston Colliery, is the sequel to a controversy covering several years.

The New Boston Colliery lies to the east of the Morea Colliery in the same basin, and when the workings of the former were driven west they were extended right up to the line dividing the two leases, leaving no barrier pillar east of the line.

About the first of the year 1910 the east gangways of the Morea Colliery were approaching this same line, and the late John Curran, then district mine inspector, gave orders to leave a barrier pillar of 300 ft. on the west side of the line. The Dodson Coal Co. claimed this to be a hardship and a big loss to them and contrary to the mine laws, which required a barrier pillar to be left in each side of a dividing line. Mr. Curran took the case into court and had an injunction issued refraining the operators from driving workings that would reduce the barrier pillar to less than 300 ft. This injunction has never been dissolved, but now that the two collieries are to be operated as one, the danger of the one being allowed to fill with water will not be renewed and the coal left in this pillar will probably be recovered.

The personnel of the organization in charge of the collieries is announced as follows: General manager, J. E. Jones; general superintendent, Frank E. Patterson; inside superintendent, William Thomas; inside foreman, Daniel Brennan; outside foreman, Louis Greis.

The lease of the Dodson Coal Co. in the Morea Colliery expires with the close of the year, and the operation is being taken over by the land owners, the Delano Land Co., and will be operated by them in conjunction with the New Boston Colliery adjoining.

The surrender of this lease by the Dodsons is the sequel to the lawsuit brought by them against the Delano Land Co. for the recovery of losses claimed by the former on account of the ruling of the courts upholding the mine inspector in his decision requiring the Dodson Coal Co. to leave intact a barrier pillar of 300 ft. between the workings of Morea and New Boston Collieries.

Putting Coal on War Basis

United States Fuel Administrator Harry A. Garfield, testifying before the Senate Subcommittee investigating coal conditions, made the following statement:

The coal year of 1917 was well under way before the Fuel Administration was created. The distribution of the coal output, which was largely under contract for delivery during the year, had already been arranged on a peace-time basis. It was necessary that these peace-time arrangements should be so altered as to meet the war demands. But it was quite as necessary that no action should be taken which would throw the entire fuel situation into chaos.

President Wilson, in announcing his original schedule of prices for bituminous coal, recognized this condition and said that there will be no immediate wholesale interference with contracts already made.

Prices were at their highest when most of these contracts were made, and up to date there has been but a small proportion of the coal output available for distribution outside of these contracts. Many contracts, of course, have run out, but a large majority of the coal mined is still sold under contracts running until Apr. 1, 1918. The Fuel Administration found it was in dire need of "free coal" to distribute to important Government plants, to public utilities and institutions and domestic consumers.

The distribution department of the Fuel Administration, starting with the small amount of "free coal" available as the difference between contracts and the output of various mines set out to meet this emergency. Many of the coal operators offered their aid. In many cases the plans of the Fuel Administration have diverted coal at Government prices from mines which were unable to deliver under contracts calling for a much higher price.

The Fuel Administration has undertaken to so direct the peace-time arrangements of the coal industry that they will temporarily meet the war emergency. Many of the steps taken in this direction are wholly temporary and of an emergency nature. They are designed to carry the country through the present winter with the least possible distress.

We are not putting into effect plans which will place the entire coal industry on a war basis. These plans will be wholly effective beginning with Apr. 1, 1918, when the present coal year will come to an end.

In this connection the Fuel Administration is establishing a zone system of distribution. Under this zone system the output of a given coal field will be assigned generally to a given consuming territory. It will be arranged that the producing field and its consuming territory shall be connected by the shortest possible transportation distance. This will eliminate, so far as possible and practicable, all cross-hauling of coal on the way to market and will tend to relieve transportation conditions.

Legal Department

INDIANA MINE SAFETY REQUIREMENTS—The statutory duty of Indiana mine operators to cause loose coal, slate or rock overhead to be taken down or secured is limited to travel and airways and does not apply to miners' working places. (Indiana Appellate Court, Peacock Coal and Mining Co. vs. Crawford, 117 Northeastern Reporter, 504.)

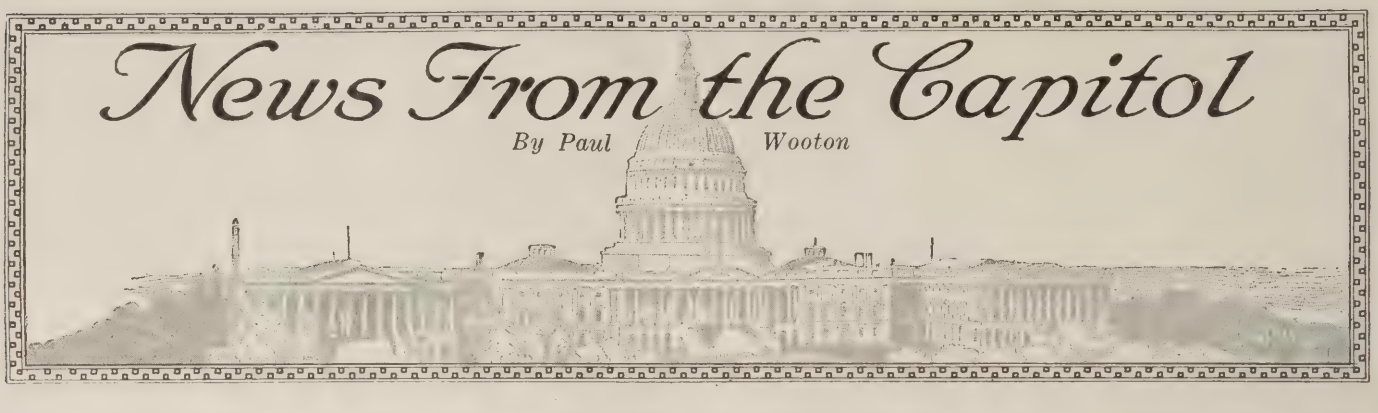
INJURY TO CONTRACTOR'S EMPLOYEE—A coal company, having awarded a contract for the mining of its coal at a fixed price per ton and on condition that the contractor should attend to roof propping and the taking down of drawslate, is not liable for injury to an employee of the contractor for injury due to a fall of slate, although the injured employee was paid directly by the company, such payments being made for the account of the contractor and being deducted from money due him on his contract. (Kentucky Court of Appeals, Lyttle vs. Rex Coal Co., 197 Southwestern Reporter, 1070.)

SUITS AGAINST NONRESIDENT CORPORATIONS—A coal company organized under the laws of another state, maintaining no office or agency in West Virginia, was not doing business in the state through the mere fact that it operated its own barges and boats along the Ohio River from Pittsburgh to Cincinnati and other lower points, so as to render its captain subject to service of process in a suit against the company while in West Virginia waters. Nor did the fact that perils of navigation may have compelled the captain to temporarily take refuge along the West Virginia shore render him subject to service of such process. (West Virginia Supreme Court of Appeals, Hayman vs. Monongahela Consolidated Coal and Coke Co., 94 Southeastern Reporter, 36.)

SNAPSHOTS IN COAL MINING

MARION STEAM SHOVEL AT WORK ON DELAWARE & HUDSON CULM DUMP

This shovel is moving nearly 20,000 cu.yd. of material per month and is owned by Porter Bros., contractors. At the time this photograph was taken the thermometer registered 5 deg. above zero. Some cold!



THAWING FROZEN CARS OF COAL TO HELP RELIEVE THE SHORTAGE

In addition to the difficulties of transporting fuel on account of the rail congestion intensified by the recent snow and very cold weather, the Fuel Administration has had to contend with frozen coal, which must be thawed out before it can be dumped from the cars. The thawing process consists of forcing live steam through pipes and hose that extend into the heart of the frozen mass

Above—A string of empties returning to the mine. Below—The tipple and incline

[*Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Metropolitan Bank Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 703, Metropolitan Bank Building, Washington, D. C., while at the capital.—Editor.*]

Weekly Production Statistics

The depression in the bituminous industry caused by prolonged cold weather continued during the week of Dec. 22. The total production of soft coal (including coal made into coke) is estimated as 9,917,145 net tons. This, although a substantial recovery when compared with the preceding week, was still 10.8 per cent. below the output during the week of Dec. 8. The average production per working day was 1,652,858 tons, as compared with 1,638,513 tons during mid-August, at the time of the coal strikes in Illinois and Southern Appalachians. Beehive coke reflected the recovery in the entire bituminous industry. The total production during the week is estimated as 545,433 net tons, an average per working day of 90,906 tons. This was still 10.4 per cent. below the production during the week of Dec. 8. Shipments reported by the nine anthracite carriers amounted to 36,060 cars, an increase of 4382 cars over the preceding week. The production of anthracite, however, was still 11.3 per cent. below the mark set during the week of Dec. 8.

For the country as a whole the week's production amounted to but 57.7 per cent. of the full-time capacity. The cold weather and snow increased the losses attributed to each one of the principal causes of lost time. The toll exacted by mine disability rose from 3.9 to 6.2 per cent. of the full-time capacity. Losses due to labor shortage and strikes, although amounting to but 3.7 per cent., reached the highest point recorded since the week of Nov. 3. Losses attributed to car shortage were the highest reported since the weekly bulletins were begun, says E. E. Lesher, of the United States Geological Survey. Thirty and eight-tenths per cent. of the full-time capacity was reported as lost on account of lack of cars at the mine mouth.

Beehive coke operations in the Connellsville and adjacent districts of Pennsylvania, during the week of Dec. 22, exhibited a partial recovery from the extreme depression of the preceding week. The plants reporting produced 56.8 per cent. of their capacity in coke, as rated by the railroads, compared with 49.5 per cent. during the week of Dec. 15. Twenty-nine and six-tenths per cent. of the full-time output was reported lost on account of a shortage of coke cars. The unusually high losses attributed to lack of cars were undoubtedly due in large measure to the burden imposed upon the railroads by the snow and cold weather.

Demand Efficient Distribution

Sharp criticism of the Fuel Administration has arisen over the shortage of coal in New York harbor. Interference with the regular movement of coal for bunker use resulted in the holding up of shipping equivalent to many round trips of a single vessel to Europe. Responsibility for the shortage seems to be shared by several of the factors involved, but many contend that the Fuel Administration should have made such an occurrence impossible at a time when full efficiency of shipping is of such transcendent importance. This and similar instances have given rise to an insistent demand for more efficient direction of the Fuel Administration's division of distribution. The experience of the last several months is held to show that a lack of foresight exists when such situations are allowed to become acute. Steps taken in time not only would prevent situations of far-reaching seriousness, but, it is said, would avert the disturbing element of drastic action which has to be taken when all reserves of coal are exhausted.

To See That Orders Are Filled

One of the direct results of the Senate probe into the coal situation was the hurrying toward operation of the Fuel Administration's plan to divide the entire country into consuming and producing districts. The appointment of D. R. Lawson, of Fairmont, W. Va., as the deputy distributor for a district in West Virginia, is the forerunner of the appointment of other deputy distributors. Mr. Lawson will have charge of a producing district consisting of Barbour, Braxton, Gilmer, Harrison, Nicholas (Gauley district of Baltimore & Ohio R.R.), Lewis, Marion, Monongalia, Preston, Randolph, Taylor, Upshur and Webster Counties. As the activities of this distributing office will likely be the same as in the other nineteen producing districts, there is unusual interest in the following instructions issued to Mr. Lawson for the conduct of his office:

1. On receipt of requests for fuel from state fuel administrators and on receipt of requests and orders for fuel from the United States Fuel Administrator, to allot such requests and orders to individual shippers and mines in the above-named area as equitably as possible, and with a view to securing prompt compliance with such orders without undue hardship to individual shipppers.

2. To report to the United States Fuel Administrator in detail on each request received from state fuel administrators and describe the action taken, including the name of the shipper or mine to which the request or order was allotted.

3. To arrange with each individual shipper and mine in your district for daily notice to you of production, working time, car supply, shipments, contracts and free coal.

4. To compile reports of production, working time, car supply, shipments, contracts and free coal and to report such figures to Washington in totals at the close of each business day, beginning at once. Forms for reporting this information will be forwarded to you as soon as prepared.

5. To comply with all instructions issued by the United States Fuel Administrator governing the conduct of your office and to recommend to the United States Fuel Administrator, from time to time, any changes in practice which might result in more efficient administration.

Contracts to Be Regulated

In order that in 1918 the whole coal output, including the coal which the mines had contracted to deliver, shall be under the direct and effective control of the Fuel Administration, an order has been issued regulating the terms of all contracts for the future delivery of coal. The order makes it plain that all contracts for the sale of coal or coke are subject to cancellation by the President or by the Fuel Administration acting by his authority.

The order limits contracts by providing that no contract shall call for the delivery of coal or coke over a period of longer than one year, and the order directs that the year period thus allowed shall terminate not later than eighteen months from the date the contract is made. Contracts must be placed at the prices fixed by the President and the Fuel Administration, and must provide that the coal or coke affected by the order is subject at all time to requisition or diversion by the Fuel Administration.

Contracts made under this order will not be recognized if they involve "Railroad cross-hauling of coal, except in the case of gas coal or coal to be used for byproduct purposes." This provision will eliminate one of the transportation difficulties now confronting the Fuel Administration, and will insure the movement of coal from mine to consumer along the shortest possible transportation lines. The order is here reproduced in full, as follows:

The United States Fuel Administrator, acting under authority of an Executive Order of the President of the United States, dated Aug. 23, 1917, appointing said Administrator, and in furtherance of the purpose of said order and of the Act of Congress therein referred to and approved Aug. 10, 1917, hereby orders and directs that under further or other order of the United States Fuel Administrator and subject to modification hereafter from time to time and at any time, the following regulations are established relative to contracts for the sale of coal and coke. A coal or coke operator or producer may, in accordance with these regulations and not otherwise, make contracts for the sale of coal mined or produced, or of coke produced or made, by him with any consumer or other person including jobbers.

1. No such contract shall provide for the delivery or supply of coal or coke over a period longer than one year; and such period of one year shall terminate at a date not more than eighteen months from the date of actual execution of the contract.

2. Every such contract for the sale of coal shall provide that the price of any coal delivered thereunder shall, with respect to each shipment of coal under such contract, not exceed the price at the mine as fixed by the President, or by the United States Fuel Administrator under authority of the President, and in effect at the date of such shipment from the mine.

3. Every such contract for the sale of coke shall provide that the price of any coke delivered thereunder shall, with respect to each shipment of coke under such contract, not exceed the price for coke as fixed by the President, or by the United States Fuel Administrator under authority of the President, for the kind of coke specified in the contract, and in effect at the date when such shipment of coke leaves the point at which it is produced or stored.

4. Every such contract shall provide that the same shall be forthwith cancelled and of no further binding effect upon either party thereto, upon receipt of a request or an order from the United States Fuel Administrator for such cancellation, and that in case of such cancellation neither party to the contract shall be under any further liability to the other thereunder and that neither shall have any claim against the United States Government by reason of such contract or the cancellation thereof.

5. Every such contract shall provide that coal or coke deliverable thereunder shall be subject to requisition by the United States Fuel Administrator, including under the term requisition the right to divert such coal or coke to any other party than the purchaser named in the contract; that such requisition may be made at any time during the continuance of the contract and prior to actual receipt and unloading of the coal or coke so requisitioned, at the point of ultimate destination, by the person entitled thereto under the terms of the contract; that such requisition shall be made at the going Government price at the date of shipment from the mine of the coal so requisitioned or of the shipment of the coke so requisitioned from the place of production or storage thereof, and without other or further liability of the Government to either party to the contract than the payment of such price and freight, so far as either party to the contract may at the time of such requisition or diversion be liable for such freight payment.

6. A jobber may make contracts for the sale of coal or coke owned by him, or to which he is entitled under contracts made by him with operators or producers in conformity with these regulations, at a price not exceeding the purchase price paid or payable by such jobber for such coal or coke under the limitations of the foregoing paragraphs numbered (2) and (3), plus such commission as may, at the time of the shipment thereof from the mine where such coal is produced or from the place where such coke is made or stored, be the then permissible jobbers' commission. All such contracts by jobbers for the sale of coal or coke shall conform to the provisions and requirements in the foregoing paragraphs numbered (1), (4) and (5).

7. Every coal or coke operator or producer and every jobber shall send within ten days of the execution of any contract by him a certified copy thereof to the United States Fuel Administrator at Washington, D. C., marked "Attention of Legal Department."

No contract may be made, or will be recognized as valid, by the United States Fuel Administrator, which involves railroad cross-hauling of coal, except in the case of gas-coal or coal to be used for byproduct purposes.

Oral contracts for the delivery or supply of coal or coke will in no cases be recognized by the Fuel Administrator as valid or binding upon either party thereto and are prohibited.

All and any contracts for the sale of coal or coke are subject to cancellation and termination at any time by the President or by the United States Fuel Administrator acting under authority of the President.

THE LABOR SITUATION

General Labor Review

It is not unnatural that the substitution of a nine-hour or longer day for an eight-hour day in the anthracite region meets with some opposition from the mine workers, though some are even now, and have for some time, been working long hours of overtime. It has been generally contended that men in nine hours can do no more than in eight, and fallacious figures have been advanced to prove it. Under normal conditions it is probably true that the shorter day is nearly long enough for a man to do his most effective work, but given the larger incentive of patriotism a bigger stint for a short while can be secured by longer working hours.

It is interesting to notice the reason given for opposing the longer working day. The mine workers do not say that eight hours is enough for any man to work. They realize fully that it is their duty and their patriotic pleasure to work as many hours as will best promote a large production. It is a loyal reason they give for the shorter day. The mine workers, we read, "believe the increased work day would hurt the coal tonnage more than help it."

Long Day Would Increase Tonnage 10 per Cent.

A. B. Jessup, the manager of G. B. Markle Coal Co., has addressed himself to meeting that argument. He says that the introduction of the nine-hour day would increase tonnage 10 per cent. Mr. Jessup says his firm needs 500 miners and laborers and 250 to 300 outside men, but cannot get them though it has plenty of work, rents are low and houses are on hand for all who want them.

He also says that there has never been any trouble from car shortage at the Markle mines. It is true that cars are scarce in the latter half of the week, but the collieries and breakers are operated regardless of that condition, for all the mines have storage bins into which the coal is dumped and from which the coal is loaded as soon as cars are available. In a vote of the locals in the Hazleton region the mine workers declared against the proposed increase in length of day. President Kennedy seems to be in full sympathy with the men of his district. He declares that if the long day would produce more coal the railroads could not handle it, and the production would demand more timber and supplies than could be secured.

Miners Seek Bonus for Working on Funeral Days

The Wyoming Valley mine workers have shown such a generous comprehension of the needs of the time that one wonders how a piece of news like the following can be justified by facts:

"Two thousand mine workers at the South Wilkes-Barre No. 5 Colliery have notified company officials that they will take time off to attend the funeral of any of their fellow union workers unless the company makes an extra cash settlement with the families of the mine workers who meet death while at work."

The mine workers' families are already compensated in case of death, and there is a provision in the mine workers' contract that they work steadily so long as work is provided. This recent demand is therefore little else than blackmail and not at all worthy of the Wyoming mine workers. If they are not satisfied with the compensation provided, let them seek legislation in accord with their ideas.

Apparently this is the view of the Lehigh & Wilkes-Barre Coal Co. Various mine workers' organizations in the Wyoming Valley have consented to send only delegations to all funerals, leaving the main working force free to give its services to the company. They are now asking $100 as a reward for doing nothing more than complying with their contract and supplying the coal which the necessities of the nation imperatively demand. They want pay for their work and pay again for being willing to perform it.

Women Are Entering Mine Clerical Service

Seven women and girls have been appointed to clerical work at the Cameron Colliery by Superintendent William Auman. Mrs. Cora Van Gasken furthermore has been made weighmistress at the same mine. The Cameron colliery is the property of the Susquehanna Collieries Co., a subsidiary of the M. A. Hanna Co., of Cleveland, Ohio. The mine workers used to be averse to women employees, but under the present circumstances they are withdrawing their objection.

The supply of cars in the bituminous region has fallen off deplorably by reason of the snow, according to a report of the United States Geological Survey, just received. In the Hazard field, Kentucky, in the week ending Dec. 15, the tonnage was reduced to 66.4 per cent. of capacity, 65 5 per cent. being the loss due to car shortage. Northeastern Kentucky failed by 64.9 per cent. of reaching full capacity, 60.9 per cent. being the shortage due to lack of cars. Somerset County, Pennsylvania, came third with 55.7 per cent. of capacity, 52.5 per cent. being chargeable to insufficient car delivery.

Unfortunate Effects of Mine Disability

But when the railroads are blocked with snow the mine tracks are also similarly encumbered. Cold weather breaks and freezes pipe lines and as a result power houses are put out of commission. The mine-disability percentage rose in Indiana to 15.7 per cent. and in the Arkansas "anthracite" district to 18.6 per cent. Illinois also lost 9.9 per cent. from mine disability. Pennsylvania with its long outside haulages suffered severely, western Pennsylvania losing 8.6 per cent. of capacity from mine disability and the Panhandle 8.7 per cent.

Labor shortage and strikes except in Illinois, where it caused a loss of 10.1 per cent. of capacity, had little effect on the coal output. Nevertheless the tonnage of bituminous coal for the week fell from 11,118,181 tons to 8,438,549 tons, or 446,605 tons a day. As the miners worked well the sad condition of the output is put squarely up to the railroads and the weather.

Work Sunday and Keep Christmas Day In South

The miners of the De Bardeleben Coal Co. at Sipsey worked on Dec. 23 although that day was Sunday. The men at that mine are ready to make every sacrifice for the needs of the country. Every man in the mine has joined the Red Cross. Dr. George R. Stuart has been addressing the mine workers, urging them to their best endeavors, and Dr. A. C. Williams has addressed the colored employees. Milton H. Fies, resident manager of the company, has always had a lively interest in the material welfare of his men. As a result of his strong sense of social service his men have also a disposition to do their utmost in the present crisis.

Coal miners of Texas and Oklahoma, acting on the suggestion of Fuel Administrator Garfield, that little time be lost because of the pressing need for coal, worked during the holiday season. Miners of Oklahoma and Arkansas placed a request before the union authorities and also before the authorities of the state, asking that they be permitted to work on the Sunday before Christmas so that they might make holiday on Christmas Day and yet not lose a day's work. Their request was granted, and more than half the miners of the fields labored on Sunday as on any other day.

John Wilkinson, president of District 21, United Mine Workers, has suggested to P. A. Norris, State Fuel Administrator for Oklahoma, that a general conference be called at once to include representatives of the Oklahoma railroads, coal operators and coal miners to discuss ways and means for relieving the coal shortage. Mr. Wilkinson will present a proposal for the establishment of shipping zones which will eliminate the waste of transportation facilities in overlapping shipments. His plan will be fully explained at the conference, and it is expected that action will be taken on it.

At a conference in Fort Worth, Tex., attended by coal-mine operators and miners of Texas, all differences in wages and working conditions were adjusted and all danger of a strike in this state was averted. The contract and working conditions adopted in the central competitive fields were approved, the contract being in line with recommendations of the Federal Fuel Administrator.

State Fuel Administrator Crossley of Missouri announces that he will appoint a war fuel board for the state, to be composed of two coal-mine operators and two miners, with himself as the fifth member. Its particular function will be to smooth out differences between operators and miners. He says that he will also appoint a war committee for each mine, on which operators and miners will be represented.

Fight About Penalty Clause Continues

It was somewhat surprising that Frank Farrington succeeded in retaining his office as president of the mine workers of the Illinois district at the recent reëlection, but he did so by a substantial majority. Despite his many excellences as a leader of the mine workers and his sterling integrity, there were not a few who opposed him for his support of the automatic penalty clause.

In a recent statement he takes a firm stand in its favor and condemns the disloyal members of the union who find fault with it. He says:

"As for the penalty clause, we have no apology to make for having signed it. No loyal member of our union need fear it. It is necessary to protect the integrity and good name of the United Mine Workers of America against the assaults of the fanatics and enemies who would disgrace and destroy it.

"More than 28,000 members of our union are now in military training camps preparing to defend the democracies of the world against the onslaughts of a ruthless military autocracy, and more will follow in a short time. As never before the nation needs coal to forge the equipment and furnish the means necessary to give them a fighting chance, and a fighting chance is what the loyal members of our union are determined that they shall have."

The statement is in part a reply to a circular issued just before the recent election, charging that Farrington and other named officers were entirely responsible for the automatic penalty clause. This statement was signed by a name that is alleged to be fictitious. Mr. Farrington says that those responsible for the issuance of the circular did not have the courage to affix their names to it and stand sponsor for it so it is obvious that they knew the charge was not true.

The automatic penalty clause is to be invoked for the first time in the central Illinois field by the Springfield District Coal Mining Co. against the 375 miners who struck at the Woodside mine near Springfield against a new system of life checking. W. B. Jess, president of the company, says that fines will be assessed against the men. The men have returned to work under protest on the assurance of Stephen Sullivan, district board member, that their complaint against the new system will be taken up by the state officials of the union.

The system to which the men object is in the interest of their safety, but they do not like it because it enables the company to keep a stricter check on them and makes it more difficult for the miners to "knock off" work ahead of time. Under it each miner is required to hang his card in the office on leaving the mine. At the close of the day the cards will show whether any men have been left in the mine and if so a rescuing party will be sent below.

It is certain that the men will resist the infliction of the automatic penalty. They are laying the foundation for such resistance now by claiming that instead of striking they were locked out by the company on their refusal to comply with the new order.

Operators and Men Must Cooperate

Wallace Crossley, Missouri fuel administrator, has announced that he will submit to the Missouri Coal War Board some production problems which he thinks should be solved. One of these is the practice of the United Mine Workers of charging a man $25 to become a member of the union. This keeps many men from entering the mines.

He declares that the failure to provide an equal turn of cars due to the lack of a proper turn bulletin or to the carelessness of the mine foreman is the cause of much loss of tonnage. He urges that a larger output would be obtained if machines were operated by more efficient methods. Time is lost because the coal is not cut, this failure being due to a false economy or to ill-chosen methods of the machine foreman. In other cases machine men and miners lose time because machines are not repaired. This may be due to lack of men and facilities for repairing the machines or to a lack of parts on hand. Again, when the machines are repaired they are sometimes not delivered, as they should be, to the men who are waiting for them.

Sometimes a loss of output results from failure to take coal away from the mines on account of the bad roads. At other times coal-car shortage is to blame or inadequate hauling equipment. Tonnage is reduced also by the bad air in the mines, the system of circulating and regulating the air current being often inefficient and inadequate.

Production would be increased if the miners would cease to abuse the lay-off privilege, if they would stay on the job till their eight hours were completed, if they would not shut down the mines for funerals which, after all, they do not attend, and if they would continue working on election days and holidays of questionable importance, the observance of which the contract forbids. Again, they quit work after starting it if some slight accident to the equipment occurs, which a few minutes would repair, or if some slight grievance arouses them, which grievance should be adjusted without a shutdown as the agreement demands. Many an hour is lost and many a ton fails to be dumped because the committee and the mine foreman waste time in excessive wrangling.

Low Wages to German Miners

The following figures are derived from the *Deutscher Reichsanzeiger*, and they show that the wage of the German mine worker, though largely increased since the war began, is much smaller than that paid in the United States. The high cost of living must make these wages little better than starvation:

NET EARNINGS OF GERMAN MINE WORKERS PER SHIFT IN SECOND QUARTER 1917 WITH INCREASE OVER SECOND QUARTER IN 1914

	Miners and Trammers		Other Underground Workers		Surface Workers	
Mining District	Net Earnings	Increases Per Cent.	Net Earnings	Increase Per Cent.	Net Earnings	Increase Per Cent.
Coal Mines:						
Upper Silesia	$1.87	60.0	$1.31	54.9	$1.17	51.2
Lower Silesia	1.36	41.3	1.19	42.1	1.00	32.5
Dortmund	2.39	61.6	1.59	47.3	1.53	45.8
Saarbrucken (State Mines)	1.95	60.4	1.50	51.8	1.44	55.6
Aix-la-Chapelle	1.92	47.9	1.39	20.5	1.29	30.6
Lower Rhine (Left Bank)	2.30	56.5	1.72	43.9	1.53	44.7
Lignite Mines:						
Hallé	1.42	42.0	1.25	45.7	1.20	43.8
Rhine Left Bank	1.63	46.5	1.45	37.8	1.49	52.1

These are the wages paid to men, not women, be it understood. Perhaps they are not the best of workmen, because many of the best men have been called into the service of the army. How a man can live on $1 a day in Lower Silesia with prices as they are, much less how he can raise a family, is a riddle insoluble. Even the Dortmund wage of $2.39 paid to miners and trammers, though larger, is inadequate.

Leave Well Enough Alone

NEWS comes repeatedly from Washington that Fuel Administrator Garfield desires to take over the coal mines of the country. If the taking over of the mines would increase production, no one will object, but it is hard to see how matters can be improved.

The mines are able to produce all the coal the nation demands. There has been an unprecedented increase in the capacity of the bituminous mines since the European war began, yet even before the war the mines had such a large output that restriction of production was seriously considered in the interest of the public.

The trouble with the coal supply in the bituminous regions is that the Government railroads cannot remove the coal as fast as the mines produce it. Let the Government, if it can, apply itself to that problem. It will take some years to solve, for the condition of the railroads has been getting out of hand during the long years of Government restriction, so that much work must be accomplished to undo the harm the Government has already done.

The Government explains that its inability to tackle the various problems presented to it is due to the large expansion of the work demanded of it. The explanation is good and is accepted as excusing most of the shortcomings. But that is no reason why we should be willing to put an efficient and adequate business in the hands of the Government. Do we wish to have the Government excuse itself by saying that in mining, as in other matters, it embarked in a new business and one larger than it was organized to handle, and therefore it fell down under the load of it?

There is absolutely no good reason but a labor reason for Government control and, just now, at least, there is only a remote possibility of labor trouble. Never were the mine workers so disposed to work harmoniously and never have they spoken so clearly against Federal control.

The existence of cross-hauling might be advanced as a reason, but this can be corrected at once by breaking present contracts, which can be done, if it be desirable. as well with, as without, Government ownership. New contracts and sales involving cross-hauling can, as in Great Britain, be prohibited.

Breaking Records

NOTWITHSTANDING the many sore spots in our industrial life that have been brought to light by recent investigations, the people of the United States, as a whole, in their war preparations are breaking all records and setting a pace that other peoples will find it difficult to maintain. Statistics covering our many lines of national effort are not public property, but we know enough to be certain that the nation's accomplishments are in keeping with our reputation as a progressive people and that they are not something of which we ought to be ashamed.

In 1916 the coal mines of America produced a record tonnage. This year our coal and coke output will exceed the 1916 production by upward of 60,000,000 tons. The history of agriculture in the United States this year will provide a similar story. Never before did we produce in the aggregate so much material of food value. The production of steel products this year will reach a tonnage not dreamed of before the war started.

In going to war with America, Germany boasted that this country could add very little to the resistance opposed her by the Allies. How far she was wrong in this conclusion will soon be evident to her. Little by little the vanguard of the American offensive is approaching the German lines. Although separated from us by the broad expanse of the Atlantic Ocean, the Teutons will soon be in contact with a war machine superior to the one she has herself been so long in building.

The number of ships in the war construction program of the navy is 787, including some ships that have recently been completed. This is considerably more than twice the total number of ships in commission on the day war was declared on Germany. In the past year the navy has expanded from 68,000 enlisted men to more than 260,000, including marines, reserves and others in service. In January, 1917, there were 4500 officers. Now there are more than 15,000 officers. The authorized war personnel of the British navy is 276,000. The personnel of the German navy at the beginning of the war was about 80,000.

To prepare its recruits for work at sea, the navy has had to expand enormously its facilities for training. The capacity of its stations and special schools for this purpose has been increased from 6000 to 113,650. Men are being trained in a number of highly specialized trades as well as in the duties of sailor and gunner. The work of a modern army is complicated, but the tasks that have to be performed by the crew of a ship are still more varied. The naval training camps naturally are smaller affairs than the great army cantonments. But one of them, the Great Lakes station, near Chicago, has accommodation for 17,000 men. The new Hampton Roads operating base that has risen almost overnight on the deserted grounds of the Jamestown Exposition has room for 10,000 recruits. The number of naval stations of all kinds has been increased from 130 to 363. The number of employees at regular navy yards in the United States has grown from 35,000 to over 60,000. Counting civilians as well as sailors, the total naval establishment numbers about 340,000 men.

At the beginning of the year there were 300 naval vessels of all types in commission; now there are "many more than a thousand." Ships that were laid up in the navy yards because there were not men enough to man them have been refitted and manned and sent to

sea. Scores of speedy yachts and power boats have been taken over from private owners, to be set at work searching for submarines.

In the past eighteen months Congress has appropriated for naval purposes $1,905,410,930. This is more money than was spent on the navy in the entire period from 1883 to 1911—the first 28 years of the existence of the "New Navy." And that period includes the years of rapid naval expansion that followed our war with Spain. Expenditures for all naval purposes at the beginning of 1917 were at the rate of about $8,000,000 a month. Now they are $60,000,000 a month. The navy is managing a huge system of radio stations. It has taken over all the stations in the United States and the insular possessions. It has recently placed in operation at Pearl Harbor, Hawaii, the most powerful wireless station in the world.

Trebling the number of ships in commission has made necessary great increases in stocks of naval supplies. New warehouses have been built at a total cost of $10,000,000. The largest of these is eleven stories high, 360 ft. long and 180 ft. wide, and contains sixteen acres of storage space. Seventy 3000-ton steamers could be loaded from its contents. It cost $1,200,000 and was built in six months.

The navy has fourteen times as many flying boats as it had at the beginning of the year, and thirty times as many men in its aircraft forces. It has built its own aircraft factory in Philadelphia. Ninety days after ground was broken for the plant, the keel of a flying boat was being laid. Five private plants are devoting their entire resources to navy aircraft work.

Last spring the United States Aviation Corps had less than 200 airplanes; now a fleet of 22,000 planes is being built. When war began there were 75 aviators in Uncle Sam's service; at the present moment 10,000 aviators are being trained.

Before any real fighting airplanes could be turned out, a new American industry had to be created. How well this has been done is evident from the fact that instead of the two companies that were manufacturing airplanes when the war started, we now have more than 100 great factories turning out liberty motors, or producing parts that will go to the creation of a vast fleet of fighting airplanes. Just what this will eventually mean is evident when we remember that the automobile factories of the United States produced 4,000,000 automobiles of the 4,700,000 such machines produced in the whole world.

It takes six months to make a flier, and the French tell us that it costs the government $25,000 to produce a finished aviator. This unavoidable condition may make us a bit slow in getting into the thick of the fight; but if it is true that England is now building at least one plane for every plane being built by the Germans, and that in 1918 Great Britain alone will outbuild the Germans two to one, then the final entrance of America into the battle will surely bring about Germany's speedy defeat.

Uncle Sam is not perfect, and his worthy sons will go on slipping up here and falling down there. However, the nation as a whole is breaking all previous production records, and it need not be doubted that the ultimate outcome will cause us to feel proud of our American citizenship.

One Standard for All

A SOLDIER in khaki and a slacker in civilian dress sat down to lunch in a chophouse. The soldier called for a "cocktail." "Oyster cocktail?" queried the waiter. Whereupon the soldier answered, "No"—very gruffly. The slacker didn't call for an alcoholic appetizer, but if he had he could have obtained it. The waiter's question to him would not have been "Oyster cocktail?" but rather "Manhattan or Bronx?"

Now why this preference for the slacker? Why deny to the fellow who is serving his country, and who may shortly lay down his very life for it, the pleasures granted to the man who is not serving it? The soldier has given up his position; he has surrendered his freedom of action for the greatest of ideals, and there is no reason why others who have not been so generous should not give up with him all that limits their capacity to serve in the rear as he serves at the front.

It is the old story. We say that the man who performs an essential service should be curbed. The soldier, the sailor, the munition maker, the shipbuilder and the miner should be sober; and the others, whose lives are less fruitful or fruitless, or fruitful only in sorrow, pain and waste, shall have their liberties uncurbed.

The railroads and the mines render the American people essential services; therefore curb them, harass them, strictly limit their profits and direct their operations. This is not reasonable. It is time to put a measure of control on everyone. It is time to cut off some of the luxuries of life, and liquor is one of these. It is time also to cut off all harmful industries that turn night into day and simple joys into heaviness.

We have got to make this war mean something to the civilian as well as to the soldier—to make the man who serves war indirectly give as much as he who girds the soldier for the fray. Let there not be two standards, one for the soldier and one for the slacker, or one for the worker in an essential industry and another for the loafer or for the worker in a needless occupation. Sobriety, steadiness, purpose—we must all have them, we must have them all.

For this is democracy; it is universal service. We have no room in America for the needlessly unfit, for addled brain, unsteady feet and nerveless hands. During the war, at least, let us be sober.

If we quote from Kipling "When it comes to slaughter, we must do our work on water," let us not limit it to the man in the fray or to the soldier in uniform behind the lines, but to every man, whether he makes a gun, or the steel of which the gun is made, or the coal by which the iron is smelted, or the pick by which the coal is dug, or the food by which the digger is kept fit for his purpose. As far as sacrifice and sobriety are concerned, the public should know of no civilians.

EACH American soldier in France requires thirty ship tons of transportation annually to keep him an efficient fighter. This means thousands of trainloads of supplies that must be hauled to Atlantic ports. Not a car can move nor a ship cross the Atlantic unless there is coal to fire the boilers. Men of the mines who lay off or lend themselves to a strike today are perpetrating a despicable crime against patriotism.

You can't work *all the time* —but work *when you can*

THE Government has taken over the railroads. Whoever helps the railroads is helping Uncle Sam. If the cars are late in the morning, don't be grouchy; if they don't come at all, try and bear it as best you can. Remember, it's Uncle Sam's railroad, and he is trying his durndest to run it so that every one will have work.

AND when the cars are placed remember your country wants you to pitch in and load coal and not quit till the cars are ALL loaded, even if you are going to be idle next day. If you don't load those cars, Uncle Sam wants them for those who will, and he will not leave as many next time. Keep your working face full of coal so that you won't have to dig coal when the mine is running.

DISCUSSION BY READERS

Power to Drive Shaker Screens

Letter No. 1—My attention has been drawn to the comparison that J. J. Kienberger has made, *Coal Age*, Nov. 24, p. 905, between the formula I suggested for determining the horsepower of a shaker screen, Vol. 9, p. 609, and that given by W. H. McGann, on page 368 of the same volume.

It will be observed that these two formulas are identical except the coefficient. Both show that the power to operate a shaker screen varies directly as the weight, the cube of the speed of the driving shaft and the square of the length of stroke.

The coefficient, in my own formula, was made large enough to indicate the commercial horsepower of the engine or motor required under the varying conditions of: (1) Poor lubrication of the screen rollers or the driving shaft; (2) overloading of the screen, which is frequently liable to occur in practice; and (3) to give sufficient reserve power for increasing the speed temporarily, should this be required; or to provide against a drop in steam pressure or line voltage.

These are practical considerations in coal mine work, and this is why I said that the formula I gave would yield good results and be entirely safe. In a particular case, however, with favorable conditions, a motor of less power than that given in my formula could be used with safety.

R. G. LAWRY, Assistant Engineer,
Chicago, Ill. Roberts & Schaefer Co.

Bossing and Being Bossed

Letter No. 4—Referring to the question of "Bossing and Being Bossed," one must acknowledge that the situation, today, is a peculiar one. Managers and superintendents, in some cases, find it difficult to secure men who are willing to undertake the responsibilities that go with the acceptance of a position as boss in a coal mine.

During the past year, conditions at the mines have changed wonderfully in this respect. Men who once would have jumped at the offer of a position as mine manager (foreman), or even assistant, are found unwilling today to accept either position, under any conditions. Money appears to be no inducement, for the simple reason that they do not care to be burdened with the responsibility of securing the necessary labor for operating the mine, at this time when men are so scarce.

Indeed, a mine manager (foreman) today might rather be called a "persuader," as there is more persuading done now than bossing. Under present conditions, it is difficult to get sufficient daymen—drivers, motormen, trackmen and timbermen. Everyone wants to dig coal.

The newcomer is willing to take shiftwork only long enough to get some miner to take him in as a "buddy," so that he can gain the two years' experience necessary to secure a miner's certificate. Great difficulty is found in drilling these new men for the work they have to do, and the boss must exercise much patience with them or he will lose them and they will go elsewhere.

No one can blame this rush of men to "dig coal." We all want to make as much money as we can. The fact that companies do not care to pay more than the scale price for shiftwork makes it difficult to secure men for this purpose and hold them. But, everybody cannot dig coal; someone must do the other work, or the mine will stop running. It is this task that confronts a foreman today and makes his position difficult.

Herrin, Ill. OSTEL BULLOCK.

Blacklisting to Prevent Mine Accidents

Letter No. 2—Referring to the recent suggestion of James T. Reynolds, *Coal Age*, Dec. 15, p. 1028, allow me to say that the blacklisting of men found guilty of unsafe practices in the mines might cause trouble with the miners' union, and this coal operators generally will wish to avoid. Companies often concede matters of lesser importance from the fear of precipitating a strike among their men. Many a foreman will hesitate to punish an infraction of the mine rules, preferring to overlook the matter rather than incur the ill-feeling of the miner. Foremen know that many miners will gather up their tools and quit rather than pay a fine for an act of carelessness.

This calls to my mind an effective method that was in use by coal operators in France. I believe that the same method, if adopted here, would go farther toward compelling miners to obey the rules and regulations of the mine than the method of blacklisting suggested by Mr. Reynolds. The method proved a success in France, where a miner's record was well known and, in order to secure work at any mine, he was obliged to keep his record clean.

PROTECTIVE AGREEMENT AMONG OPERATORS

An agreement existed between all coal operators binding them never to employ a man who failed to show his record book. He must carry his book with him when making an application for work. The book gave the man's name and description, showed at what mines he had worked and the nature of his employment, together with the dates when he started and quit. The reason for the man's quitting was given and the statement was signed by the mine foreman.

When a man applied for work at a mine he was asked for his record book. This was examined by the foreman, who was thus able to tell exactly what work the man had done and what satisfaction he had given the foremen who had previously employed him. If the report was satisfactory and the man was given work, his book was deposited in the files of the company.

A company would have no right to retain a miner's book, in order to hold him in its employ. It was agreed, however, that when a miner desired to quit, he must give the company three days' notice before doing so. Likewise, the miner was to be given three days' notice by the company if discharged.

One advantage of the record book was that a man who had been driving a mule could not claim that he was capable of running a machine, timbering, or doing other work with which he might be wholly unfamiliar.

The record was also a strong incentive to a man to obey the rules and regulations of the mine where he was employed, as failure to do this would be noted by the foreman in his book and spoil his chances for securing another job at any mine where he might apply. Realizing this fact, a miner always thought twice before disobeying orders.

The book also had a tendency to keep men at work in the same place and destroyed their desire to keep moving about from one mine to another. It was a custom, also, that a miner when joining another local must not only show his transfer card, but produce his record book before being accepted as a member.

Bad Practice in Shooting Down Roof

In my opinion the adoption of this scheme or a similar one would render mine work much more secure than it is at present. An incident that occurred in the mine where I worked, not so long ago, shows the need of men being fully acquainted with the work they must perform. In this instance a company man was sent to shoot the roof down, in my room, in order to provide material for packwalls.

After drilling the hole, the man went for his powder, cap and fuse. Being an old miner, I was much surprised to see him return with three sticks of dynamite, which he laid on the ground. Then, inserting the fuse in the cap, he proceeded to secure it by hammering the edge of the cap with a piece of rock, on the rail. It did not take me long to get on the other side of a car that was standing near-by.

To my question, "Where did you learn that trick?" he replied, "Well, do you think I never fired a shot before?" Pushing the powder back into the hole, he inserted the primer with the fuse attached and closed the mouth of the hole with a piece of old rag, after which he fired the shot. In all my experience as a miner, I had never seen such a shot fired.

The man listened to my explanation of how such a shot should be charged and fired, and then went on his way laughing, as he had other shots to fire in other places. I wonder that the man is still living. The incident, however, may have done him some good, as I saw him, a few days later, going his rounds with a tamping bar in his hands.

In closing, let me say in regard to the record book mentioned previously, that a miner when leaving a mine in good standing had written in his book over the signature of the foreman, *"Libre de tout engagement"*; which translated is "Free of any obligation."

Peru, Ill. GASTON LIBIEZ.

Letter No. 3—I heartily agree with James T. Reynolds when he says that mine accidents "are chiefly the result of carelessness on the part of miners," *Coal Age*, Dec. 15, p. 1028; but I doubt very much whether the method suggested by him to prevent the occurrence of such accidents would have the desired result.

Every person interested in coal mining would undoubtedly welcome any method that could be adopted that would effectually reduce the number of mine accidents due to carelessness. I believe that drastic action, in one form or another, should be taken against any and all persons who neglect or refuse to perform the work in which they are engaged.

Such action, however, should not be of a nature that would drive men from the mine and leave them to seek work in other industries where they would still be careless and prove a menace to the men working with them. In my opinion that is what the method suggested by Mr. Reynolds would accomplish.

Blacklisting and the Federal Law

If the blacklisting of careless workers was possible, it is still a question whether the law of the United States would permit any action on the part of coal operators that would prevent a man from securing work at any of their mines. An operator certainly has the right to discharge a man who fails to perform his work in a satisfactory manner or disobeys his instructions or violates the mine rules or mining law of the state.

Allow me to suggest that the Bituminous Mine Law of this state, under which our mines are operated, provides for the punishment of any person or persons violating the provisions of the act or the safety rules of the mine. The law makes it a "misdemeanor" for any person to work in an unsafe place knowing it to be unsafe, except for the purpose of making it safe. In the absence of the mine officials, each miner must judge of the condition of his place and it then becomes his duty, under the law, to safeguard himself.

Not American in Principle, Other Methods More Effective

My opinion is that to blacklist a person for an offense is not truly American in principle. Rather let the mine foreman penalize a miner for carelessness or disobedience. Talk the matter over with him and tell him that the offense must not occur again. If the act is repeated, however, suspend the man for a stated time; be firm; do not fuss with him about the matter. Men will respect a foreman more for such dealing, and it will prove more effective than any blacklisting of careless employees.

An experience of 38 years as a miner convinces me that the man working at the face is not the only careless person employed in and about the mines. The same principle holds true in all industries; carelessness is a human frailty, and it would be difficult to know where to draw the line in blacklisting.

It is true that much has been said and done with the aim of reducing the number of accidents in mines; and much good has been accomplished in this direction, although the results are yet far from satisfactory. As far as my observation and knowledge go, 90 per cent. of the men employed in our mines heartily favor the safety-first movement.

In several districts I know, the miners' local has voluntarily pledged its support to the mine foremen, in enforcing safety regulations in their mines. This

shows that the men themselves are interested in reducing the accident list.

The showing of moving pictures, illustrating how accidents occur in mines and how they may be avoided, has proved effective and is a step in the right direction. Probably nothing that has been attempted has interested the men more generally, in the matter of safeguarding themselves, than these motion pictures, which bring the facts before them in a forcible manner that is not soon forgotten.

In conclusion let me say again: "Enforce the mining law and maintain strict discipline, in the mine, by compelling obedience to the mine regulations and instructions given the men in the performance of their work. Penalize all men who disobey instructions or go contrary to the mine rules. Let the foreman use tact, however, in dealing with such cases.

Where a man violates the mining law, report the case promptly to the mine inspector of the district, who is authorized by the law to take action against the offender. By the use of such methods, I believe, the most good can be accomplished. A MINER.

Punxsutawney, Penn.

Letter No. 4—There is much truth in the remarks of James T. Reynolds, *Coal Age*, Dec. 15, p. 1028, regarding the necessity of adopting effective measures to overcome the carelessness of men working in the mines. The illustration that he gives of the man who scoffed at the safety-first movement and remarked that "men will do as they d—— please, anyway," is a common experience with every mine foreman.

Such an attitude on the part of a miner and such a response, or a similar one, to the instructions given him by a foreman, cuts very deep and affects different foremen in a different manner. Instructions in regard to safety are always given by a foreman with a sincere desire to make the work safe, both for the man's own sake and for the protection of the lives of every man in the mine. While some would be angered by the reply of the man and retort in a similar manner, the majority of foremen will let the remark pass and move on to the next place, only to return in a short time to see that the necessary work has been performed.

FOREMEN OFTEN SEVERELY TRIED BY MINERS

In any event, however, there is no doubt that the patience of foremen is frequently severely tried when they feel that their own lives, as well as those of others, are endangered by the attitude of such men. At times, the remark received acts as a damper on the foreman, which he strives to overcome in giving the needed instructions to men in other places.

There is no doubt but something should be done to reduce the number of accidents due to carelessness, though the method of blacklisting suggested by Mr. Reynolds does not appeal to me as the best course to pursue to accomplish this end. I want to urge a more thorough inspection of mines and the maintaining of stricter discipline, by the punishment of those who disobey instructions or disregard the mine regulations and rules for safety. The punishment should be such as to place all careless workers in a class by themselves. The penalty need not be severe, but should be of such a nature that it will be for the man's interest to avoid doing the same thing a second time.

Violations of the mining law should be promptly reported to the district mine inspector, whose duty it is to prosecute the guilty party by entering a complaint against him. A man who has paid the expenses of a prosecution in court once will not care to incur the same obligation. A court should give its aid to the mine inspector in the performance of his duty under the law, to enable the speedy conviction of the man for the alleged violation of the mine law, and the guilty party should be fined so that he will not be apt to repeat his act.

COÖPERATION NEEDED TO ENFORCE DISCIPLINE

It is my belief that if all mine officials would cooperate in this matter by posting a notice to the effect that, commencing Jan. 1, 1918, all violations of general or special rules will be reported promptly to the district mine inspector, for the purpose of having the guilty party prosecuted and punished, there would be something doing and a change for the better would take place. Not only would less accidents occur in the mine, but there would result a larger output of coal because of the increased safety.

It should be remembered that mine officials are themselves liable to prosecution for not doing their full duty in this regard. I am convinced that a few prosecutions at different places would soon have the effect to arouse careless workers to a sense of their duty to themselves and their fellows in the mine, and good results would follow. R. W. LIGHTBURN,

West Leisenring, Penn. Mine Foreman.

Clearing a Heading of Gas

Letter No. 4—I was much amused by the inquiry of Mine Foreman, which appeared in *Coal Age*, Nov. 10, p. 823. The inquirer states that he attempted to remove a body of gas from the face of an entry by hanging a canvas in the return air-course at a point 90 ft. back from the face. This struck me as a joke, especially as he remarks, "The idea, as far as moving the gas was concerned, seemed good." Although he does not say that the experiment was a success, if the gas was not moved he could hardly say that the idea seemed good to him.

The mine where I am employed as mine foreman is a gaseous mine, but we don't try any experiments such as the one here mentioned. Whenever we find gas or observe our ventilation getting a little weak at the face we proceed to remedy the trouble at once. I don't consider gas anything to experiment with in coal mines. The sooner it is removed, the better. I am willing to leave all experiments of that kind with the Bureau of Mines.

Briefly outlined, our method of removing gas, which has always proved successful, is as follows: All entries are driven 10 ft. wide and the track is laid 3 ft. from one rib and 4 ft. from the other rib, the track gage being 3 ft. This permits a row of posts to be set 1 ft. from the rail on the wide side of the entry, so as to provide a 3-ft. air space behind the brattice.

Like Alfred Engell, *Coal Age*, Dec. 8, p. 990, we nail brattice boards at the top and bottom of the posts for

the support of the canvas. In my opinion, however, the 2-ft. space behind the brattice, as described by Mr. Engell, does not appear to me to be sufficient. I believe such a narrow passage would cramp the volume and reduce the circulation of air in that heading, provided the coal is only 6 ft. thick. Assuming a velocity of 200 ft. per min., the volume of air passing would only be $6 \times 2 \times 200 = 2400$ cu.ft. per min. I am of the opinion that the farther the brattice can be placed from the rib of the entry, the better will be the results obtained. I should be glad to see the question of arranging brattices under these conditions further discussed.

McIntyre, Penn. SAMUEL JONES.

Mass Education Needed

Letter No. 2—What Henry Bock says in his letter on mass education, *Coal Age*, Dec. 8, p. 987, reminds me of an interview with a very prominent mine manager, whose name is familiar in every part of the anthracite coal fields. He said, "Education, conjoined with natural ability, will now and hereafter be the guiding star of mining enterprise."

This saying is very true and, as a proof that technical education is the key that unlocks the mineral treasures of the earth, we have only to notice the skill displayed in the design of machines that reduce manual labor and give better results. The utilization of natural forces in hydraulic mining; the conversion of the power of Niagara into electrical energy and the combination of natural and mechanical forces in the operation of a mine and the preparation of the coal for market, all illustrate the value of technical education coupled with practical experience.

What Technical Education Has Accomplished

It is technical education that has made possible the conservation of many natural resources. Coal screenings that, a few years ago, were dumped on the waste heap as worthless, are now being utilized for the production of power. Outcrop coal that was abandoned as unminable, in the earlier days of mining, is now being recovered, by the use of specially designed equipment. Methods of mining and handling coal have been improved and greatly developed as a result of technical knowledge that gave a greater grasp of the forces of nature with which the miner is always confronted.

While it is true that no amount of scientific or theoretical knowledge will fit a man to take charge of a mine unless he has practical experience to guide him, it is just as true that a practical man's capability is greatly increased by a knowledge of the science and theory of mining. Indeed, the future is likely to develop a still greater need of technical knowledge to insure success. Technical education includes not only a knowledge of natural and mechanical forces, but knowing how to apply them in practice; and this is best learned from the experience of successful men. To rely on one's own aptitude, in this regard, would be to work in a comparatively narrow groove.

The up-to-date mining student is progressive. He studies what other mines are doing and observes their successes and failures. The reading and study of descriptions of mining methods and equipment is all right in its way; but much that is written is too general, and success in practice depends on the manner in which the small details are worked out, in the adoption of new methods and equipment.

At the mine where I am employed, the company changed foremen two years ago. The new man was broadminded and possessed a valuable experience that he had gained in many years of practice. During that time he had visited a large number of collieries to observe their methods and study their equipment. He was a reader of first-class technical literature, and this, together with his keen discernment, has enabled him in two short years to increase the production of the mine 25 per cent., while the cost of its operation has been reduced in about the same proportion. When asked how he did it, his reply was, "By taking advantage of every economical device and method I have seen, and by improving on some of them."

Visiting Other Mines to Observe Methods

An occasional visit to neighboring districts will seldom fail to bring results to the man who is broadminded enough to recognize that he has much to learn from the experience of others. One of the largest mining companies in the anthracite field has found that the policy of sending an intelligent official on a two weeks' tour of inspection of other operations has proved of great value. This has been shown by the many economical devices and methods employed by that company. Many of these are improvements on similar devices in use at other mines.

Some time ago, the same company sent its superintendent to look at a system of haulage in use at a mine 100 miles away. After a close inspection of the system, the superintendent returned and reported that the only thing about the equipment that he would care to adopt was the detaching hook, which was of special design and just what was needed to increase the efficiency of their own system, which he thought was, in other respects, superior to the one he had visited.

It is freely admitted that the time and money spent in making this visit was repaid to his company many times over, in a few months. This simple incident illustrates how any intelligent mine official, by going on an occasional tour of inspection, will gain much information that will prove a real benefit.

The same truth applies to young men who are studying mining while getting their practical experience working in the mine. Aside from the material advantages derived from technical study is the fact that it trains the intellect and develops a taste for some special branch that may later prove a source of absorbing interest and pleasure. FRED B. HICKS.

Kingston, Penn.

Relative Size of Intake and Return Airways

Letter No. 1—I cannot agree with the answer given to an examination question that appeared in *Coal Age*, Dec. 15, p. 1033. The question reads as follows: "Which, if either, should be the larger, the main intake or the return airway? Explain why."

The answer states that "under the conditions common to coal mining, the return airway of a mine should have a larger sectional area than the intake airway,"

and gives as the reason the increased temperature of the return air current, and the increased volume of that current, due to the presence of mine gases.

I claim that the haulage road should be the larger airway, regardless of whether it is the intake or the return airway of the mine. My reason is that every car or trip of cars offers a certain amount of resistance to the air current passing on the haulage road. When the haulage is performed on the intake airway, it seems to me that the resistance offered by the cars passing in and out of the mine will overbalance the effect of the increased volume of the return current because of its higher temperature and the gases generated in the mine.

I would be glad to see this question discussed by the readers of *Coal Age*, hoping that more light may be thrown on the matter. The question is to what extent does the movement of the cars obstruct the circulation of the air on the haulage road, and how does this resistance to the flow of the air compare with the increased resistance due to an increased velocity of the return air current, as suggested in the answer given to this question, on page 1033.

Windber, Penn. F. E. SCHROYER.

Shotfiring in Mines

Letter No. 4—Referring to the letter of Gaston Libiez, *Coal Age*, Dec. 15, p. 1030, I will acknowledge that, in the rather distant past, I shared his view in regard to the explosibility of the gases produced by the combustion of powder in blasting coal. We all realize that it is convenient to go with the crowd or, in other words, to accept too freely the general belief and statements of textbooks, without making a personal investigation and examining critically the proofs offered in support of the theory advanced.

In regard to the question in hand, certain observed facts led me to doubt the correctness of the belief that the mixture of gases produced by the explosion of black powder, and commonly known as "powder smoke," constitutes a highly dangerous element in starting an explosion in a mine. Doubt being once aroused, my further investigation of the matter developed sufficient proof to convince me that the mixture of gases liberated by the explosion of black powder, as stated in my previous letter, "is incapable of promoting or maintaining an explosion." To this statement Mr. Libiez takes exception, but to my mind it is true.

EXPERIENCE IN COAL MINES IN IOWA

When the miners in Iowa fired their own shots, at the end of each shift, and the ignition of the powder was accomplished by the use of squibs, it was necessary to fire the shots in consecutive order. Ordinarily two or more shots were prepared in each working place and all shots following the first had to be fired in the presence of a hot, dense cloud of powder smoke produced by the preceding shot or shots.

This method of firing shots extended through a period of many years, and thousands of practical tests were thus furnished daily, clearly disproving the claim that the gaseous mixture produced by the explosion of powder materially assists in starting a mine explosion if such mixture is exposed to the flame of subsequent shots. The results of these tests not only proved this claim to be without merit, but showed the fallacy of the belief that greater safety is assured by firing shots in the presence of pure air.

It may occasion some surprise, but the statement is true that when making these tests several explosions occurred when two or more shots were fired consecutively in well-ventilated places that were clear of powder smoke, while no explosions resulted from the firing of a second, third or fourth shot, in places having little or no circulation and where the hot gases of the first shot or shots filled the place.

RESULTS OF A LARGE NUMBER OF TESTS IN MINES

The results of the tests led me to make the statement, in my previous letter, announcing my belief that the presence of dense clouds of powder smoke "will have a decided quenching effect on the flame of an explosion that is already under way."

The circumstance mentioned by Mr. Libiez, and well known to all coal miners, regarding the inflammable nature of the gases confined behind a "standing shot," no doubt is largely responsible for the existing belief in the explosibility of the mixture of gases produced in blasting. While I have lighted the gas under such circumstances a number of times, only feeble flashes were produced, which did no harm.

In order to show that the conclusions drawn from such an occurrence are unjustified, allow me to suggest that the gases confined behind a standing shot are necessarily quite different from the mixture of gases thrown into the air when a shot is fired. Besides the fact that the crevice produced in the rupture of the coal is filled with fine coal dust, it is possible that the flash observed when a lamp is introduced in the crevice is due to a small percentage of marsh gas present to a limited extent in most coals.

WHAT CHIEFLY CAUSES THE FLASH BEHIND A SHOT

That is only a suggestion, because it is my belief that the flash is chiefly due to the volatile matter distilled from the fine coal dust first mentioned. This belief is supported by the fact that there can generally be found small particles of coal in a more or less coked condition, at the bottom of the crack, after flashing the gas confined in the crevice.

Moreover, the narrow space behind a standing shot, being filled with hot gases, acts as a chimney and the fresh air entering at the bottom may form an explosive mixture in this confined space, notwithstanding the weakening effect of the powder smoke that is present. Also, the fact that the flash is generally feeble indicates that the presence of the powder smoke has a weakening effect on the explosion, which would otherwise manifest greater violence.

My belief, therefore, is that while the mixture of gases produced in blasting in a close place is undoubtedly injurious to health and may even prove dangerous to life, it exerts an extinctive effect on the flame of the explosion, owing to the lack of available oxygen. This, in short, is the basis of my belief that a reduced circulation of air in the workings of a mine, at the time of firing, lessens the liability of an explosion taking place.

JOHN VERNER,
Chariton, Iowa. Former Mine Inspector.

INQUIRIES OF GENERAL INTEREST

Estimation of Depreciation on Stripping Equipment

Referring to the letter of H. B. Miller, *Coal Age*, Nov. 24, p. 902, describing the method of recovering outcrop coal by stripping, I am much interested in learning how he estimates the depreciation in the value of the stripping equipment.

It seems to me that the custom of most companies, when putting in a stripping plant, such as that described by Mr. Miller, would be to figure the entire cost of the plant against a single job, or at least to charge 50 per cent. of the cost of the equipment to the work in hand. This, of course, would depend, to a certain extent, on the size of the undertaking and cost of the equipment required for its completion.

Mr. Miller has allowed $24 a day for depreciation. Taking his estimate of 1400 tons of coal handled per day, the time required to remove 567,216 tons, in this case, would be a little over 400 days, which would make the total depreciation of equipment charged in this case $400 \times 24 =$ say $10,000.

This appears to be a small amount to charge for depreciation in such a plant, which Mr. Miller estimates as having a value of $150,000, including track material of all kinds.

Taking the depreciation as 50 per cent. of the total value of the plant, or $75,000, according to the custom just mentioned, would make the depreciation, in this case, $75,000 \div 400 =$ $187.50 a day, instead of the $24 a day estimated by Mr. Miller. I would much appreciate learning his method of estimating the depreciation in value on this equipment. B. H. STOCKETT.

Shenandoah, Penn.

The inquiry of this correspondent was submitted to Mr. Miller, whose reply follows:

In estimating the depreciation in the value of an installation, it is my custom to base the estimate on the supposed life of the equipment. In the present instance, I believe that, under favorable conditions and with proper care and upkeep these large-type shovels, worked single-shift, would be good for 20 years of service. I have included the cost for repairs and upkeep in the original estimate, taking this at $18 per day. The depreciation of $24 per day, given in my estimate, was arrived at about as follows:

Taking the working days in a year as approximately 313, would give for the total number of days estimated in the life of the machine, $20 \times 313 = 6260$ days. Then, assuming the total cost of the equipment is $150,000, the rate of depreciation would be $150,000 \div 6260 =$ say $24 per day. Estimating this equipment as handling 1400 tons per day would make the depreciation $2400 \div 1400 =$ 1.7c. per ton.

Before undertaking the installation of a stripping plant for a small acreage, it is my custom to ascertain if there is other territory to which the equipment can be moved on completing the work in hand. Finding such adjacent territory, I would charge the cost of moving the equipment against the second tract, which would give the first acreage the full benefit of depreciation charges.

Assuming that the acreage, however, was sufficiently large to keep the equipment busy during its entire life, say 20 years, single-shift, or 10 years, double-shift, I would then figure the entire cost of the plant against the one job. Again, if the work would only last 5 years, by double shift, I would estimate the depreciation as 50 per cent. of the value of the equipment, allowing the remaining 50 per cent., to be charged to the next job, with the additional cost of moving the plant. Some contractors figure on a depreciation, per annum, of 10 per cent. of the total cost of the plant, working single-shift. H. B. MILLER,

Pittsburgh, Penn. Mining Engineer.

[The above reply answers fully the method used by Mr. Miller in estimating the depreciation in value of equipment, which appears to be equitable.—Editor.]

Shotfiring in British Columbia

While the discussion of shotfiring is absorbing so much attention on the part of the readers of *Coal Age*, because of the importance of the work in respect to the safety of life and property, allow me to ask what regulations govern the firing of shots in the Province of British Columbia. I have been informed that the Coal Mines Regulation Act is very explicit in reference to the handling and use of explosives underground and that, as a result of the strict enforcement of the rules and regulations, accidents in blasting are not frequent. I would like to ask if shotfirers are employed and how the shots are fired. SHOTFIRER.

Delagua, Colo.

It is true the General Rules of the Mines Regulation Act, under which the coal mines of British Columbia are operated, are very explicit in regard to the use of explosives underground and the firing of shots.

All shots are fired by certified shotlighters. In non-gaseous mines where open lights are used shots may be fired by fuse. The miner can take the powder and fuse into the mine, but the detonators must be carried into the mine by the shotlighters by whom they are issued to the miners at the face when and as required.

In gaseous mines where safety lamps are used all shots must be fired by electric battery. In that case the miner is permitted to take with him into the mine both the electric detonators and the powder; but the shotlighter is the only person who is permitted to carry the battery. The shotlighter on entering a place examines a shothole, and if satisfied that it is safe he oversees the charging of the hole. After firing the shot, he must return and examine the place before permitting the miner or miners to return to the working face.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—At $50 a ton what would be the cost of the iron required to lay a track ½ mile in length, using 16-lb. iron for that purpose?

Ans.—The length of rail required for a single track, in this case, is $2 \times 2640 \div 3 = 1760$ yd. Using iron weighing 16 lb. per yd., the total weight required would be $1760 \times 16 \div 2000 = 14.08$ tons. The total cost for iron is, therefore, $14.08 \times 50 = \$704$.

Ques.—What quantity of water will be contained in a sump 100 ft. in length, 7 ft. 6 in. in width and 5 ft. 3 in. in depth?

Ans.—The cubic contents of this sump is $100 \times 7.5 \times 5.25 = 3937.5$ cu.ft. Since 1 gal contains 231 cu.in., the capacity of this sump is $3937.5 \times 1728 \div 231 = 29{,}454$ gallons.

Ques.—Water accumulates at the rate of 200 gal. per min., at the foot of a shaft 600 ft. deep. Power for pumping is available during 8 hours each day. What is the horsepower of the pump that will be required to handle the water in this shaft?

Ans.—Since water flows into the shaft at the rate of 200 gal. per min., the quantity of water that would accumulate in 24 hours is $200 \times 60 \times 24 = 288{,}000$ gal. A pump that will handle this water in 8 hours must have a capacity of $288{,}000 \div (8 \times 60) = 600$ gal. per min. Using a standpipe of sufficient diameter to reduce the velocity of the flow of water in the pipe to such an extent as to practically eliminate the friction head, say a pipe 8 in. in diameter, the horsepower required to operate the pump is then calculated from the formula

$$H = 0.00034\ Gh$$
$$= 0.00034 \times 600 \times 600 = 122.4, \text{ say } 125\ hp.$$

Using a 6-in. standpipe, however, will cause a friction head

$$h_f = \frac{G^2 h}{800 d^5} = \frac{600^2 \times 600}{800 \times 6^5} = 34\ ft.$$

This friction head must be added to the gravity head, making the actual head, against which the pump then operates, 634 ft. The required horsepower, in that case, will be

$$H = 0.00034 \times 600 \times 634 = 129.3 \text{ say } 130\ hp.$$

Ques.—What would be the difference in the reading of the barometer between the surface and the bottom of a shaft 1000 ft. deep?

Ans.—The reply to this question will depend on the elevation of the place above sea level, if an exact answer is desired. At sea level, under normal atmospheric conditions, one inch of mercury column corresponds to an air column of about 925 ft. in height; while, at an elevation of 2000 ft. above sea level, it is equivalent to 996 ft. Again, in order that the barometric readings shall correctly represent the depth of the shaft, both readings must be taken under the same ventilating pressure, whether the fan is blowing or exhausting. For example, it would not be right to compare a free-air reading on the surface with a reading taken at the bottom of a fan shaft, either a downcast or an upcast shaft.

Assuming the top of the shaft is at sea level, the exact difference of barometric reading between the surface and the bottom of a shaft 1000 ft. deep, for normal conditions as taken from tables is 1.097 in.

It is customary, however, to estimate on each 90 ft. of depth, near sea level, as corresponding to 0.1 in. of mercury, which would make the difference of reading, in this case, $0.1\ (1000 \div 90) = 1.1+$ in.

Ques.—What volume of dry air is required to completely explode 350 cu.ft. of marsh gas?

Ans.—For the complete combustion of one volume of methane or marsh gas (CH_4), there is required two volumes of oxygen, as expressed by the equation

$$CH_4 + 2O_2 = CO_2 + 2H_2O$$

In this equation, the numeral preceding the molecule indicates the volume of the gas concerned, and since oxygen forms 20.9 per cent. of pure air, by volume, there is required $2 \div 0.209 = 9.57$ vol. of air to burn one volume of methane.

Ques.—There are 20,000 cu.ft. of air per minute passing along an airway having a rubbing surface of 35,000 sq.ft. and a sectional area of 35 sq.ft. What is the water gage?

Ans.—The water gage, in this case, is found thus:

$$w.g. = \frac{ksQ^2}{5.2a^3} = \frac{0.00000002 \times 35{,}000 \times 20{,}000^2}{5.2 \times 35^3} = 1.25\ in.$$

Ques.—In an airway 72 sq.ft. in sectional area, the velocity of the air is 550 ft. per min.; what will be the velocity of this current where the area is reduced to 60 sq.ft.?

Ans.—For the same quantity of air in circulation, the velocity of the current varies inversely as the sectional area of the airway. In other words, the velocity ratio is equal to the inverse area ratio. Hence, calling the required velocity, for an area of 60 sq.ft., x, we have

$$\frac{x}{550} = \frac{72}{60} = \frac{6}{5}$$

$$x = \frac{6 \times 550}{5} = 660\ ft.\ per\ min.$$

Ques.—What measures would you take to secure the best possible results from a fan, the capacity of which is limited and the demands upon which are close to its capacity?

Ans.—Since the fan is being operated, at present, approaching its full capacity, the circulation in the mine can only be increased by cleaning up all air-courses, enlarging breakthroughs, shortening the course of the air wherever this is practicable, and removing every obstruction to the flow of the air current. Wherever practicable, the air current should be divided into one or more separate splits, which will enable a larger volume of air to circulate under the same power.

COAL AND COKE NEWS

For the Busy Reader

Further authority has been conferred upon James J. Storrow, the fuel administrator for New England. He may now divert coal as he sees fit so as to meet any exigencies that the situation may present.

* * *

To coöperate with the Fuel Administration in securing an equitable division of coal, the National Retail Merchants Association has opened an office in Washington. Samuel B. Crowell will be in charge of the Washington office.

* * *

A story comes from Newark, N. J., to the effect that a retail jeweler took a job as a coal-wagon driver. He started out with two tons of coal, which he dumped in his own cellar and then resigned, saying the work was too hard.

* * *

An announcement made by the New York, New Haven & Hartford Railroad Co. states that during the 11 months ended Nov. 30, the road moved 390,505 more tons of coal over its lines than in the same period of 1916. Of this increase, the larger part was anthracite coal.

* * *

Two pounds of seasoned wood have a fuel value equal to one pound of coal, according to experts of the Government forest service. While different kinds of wood have different fuel values, the foresters say that in general the greater the dry weight of a nonresinous wood the more heat it will give out when burned.

* * *

That the Fuel Administration adopted a happy thought in its "tag-your-shovel day" is evidenced by the cordial manner in which the school authorities throughout the country are coöperating. The day set aside for this purpose is Jan. 30. The tagging of the shovel of the governor, the mayors and other officials is a distinction to be awarded those who have earned it by having tagged the largest number of shovels.

* * *

Had the coal production been continued at the rate to which it had been pushed by the Peabody committee, it would have been sufficient to supply not only the entire coal requirements of this country, but in addition would have been sufficient to create a large surplus to relieve the coal shortage of the allied nations. The foregoing is the salient feature in the report on the work of the Committee on Coal Production sent to Congress by the director of the Council of National Defense.

* * *

In the hope of removing the uncertainty as to possible action with regard to coke prices, Dr. Garfield last week made a formal announcement to the effect that there would be no general revision of coke prices during 1918. All contracts and sales of coke dating from Sept. 24 must conform to the Government schedule. Dr. Garfield pointed out that this is not to be interpreted to mean that small outlying operations, where costs are abnormally high, may not be granted exceptions which will permit of the profitable continuance of such production.

* * *

In producing the largest amount of coal and coke in the history of West Virginia—80,547,370 gross tons—394 persons were killed and 993 injured among 88,665 persons engaged in the industry, according to the mining statistics for the fiscal year ending June 30, 1917. These figures exceed those of 1916 by 935,072 gross tons; coke was produced to the extent of 2,533,314 net tons, an increase of 575,682 tons over 1916. The gross tonnage of coke the latter year was 1,957,632 and in 1911, 2,694,047. The value of the coke and coal is established at nearly $183,000,000 and more than $96,000,000 respectively.

* * *

Less coal was carried by the Norfolk & Western Ry. during the month of November last, than during any month since April, 1915, with the exception of February, this year. During the thirty days of the month, 2,434,238 tons of the bituminous product were shipped over this system, as compared with 2,690,016 during the preceding month, and 2,790,178 during November, 1916. Shipments from fields directly along the Norfolk & Western system during November, last, also showed a decrease when compared with the 2,369,026 tons hauled in October, this year, and the 2,271,535 tons carried during the corresponding month of 1916. The total from these fields during the first eleven months of 1917 is 24,800,552, and for the same period of 1916, 25,738,190.

HARRISBURG, PENN.

Presiding officers of the two branches of the Legislature have completed appointment of members of the commissions to study health insurance and to codify the insurance laws. The Health Insurance Commission will meet in Philadelphia, at the call of the chairman.

Senators Beidleman, Dauphin; Weaver, Westmoreland, and Sones, Lycoming; and Representatives Flynn, Elk; Ramsey, Delaware, and Stearn, Philadelphia, were named on the health insurance commission on which Governor Brambaugh named William Flynn, Pittsburgh; William Draper Lewis, Philadelphia, and Dr. J. B. McAllister, Harrisburg.

The inability of coal companies to unload coal cars at Tidewater points due to the low temperature, has caused the sidetracking of thousands of cars of coal in various railroad yards and a tremendous scarcity of cars in the coal regions. The lack of barges to transport the coal to New York and other points has also figured in causing the car shortage. Many of the mine workers contend that the tracks in the various yards of the railroads have been filled for some time by loaded cars waiting to be moved to destination.

The scarcity of the small cars in the mines has also handicapped the miners greatly in increasing the production of coal in some sections. The area of most mines has more than tripled during the last four years but miners say that the supply of mine cars has not increased. The distance a car of coal has to travel from the miner to the surface has greatly increased in many mines, and miners report that cars are so scarce that at various times they are not able to work for at least an hour or two while waiting for another car after one has left them for the surface.

In the bituminous region many of the mine owners continue to blame the railroads for failure to furnish cars and in some of these cases claims have been made that when coal has been shipped it has been held up.

Operators in the Pittsburgh district, for the most part, have completed their November cost sheets and find that production is much more expensive than it has been any month yet under Government fixed prices for coal. Many of the operators assert that if any advance is not granted them soon they will be compelled to shut down their mines. Car shortage is given as the reason for higher cost of production. The operators say their overhead charges are the same if they operate their mines full or in part. The car shortage situation in the district, however, has improved greatly in the last week of the month.

Elimination of cross-hauling is expected to simplify the transferring of coal freight on the railroads. Coal from West Virginia mines will not be taken to Philadelphia, while coal mined in the bituminous section of the state will be shipped south. Every operator will be ordered to ship his product to the nearest market. This will be done through priority orders.

The charges made by Frank C. Reese, a former member of the Legislature from Pottsville, that anthracite operators are inflating their profits by shipping coal to the public containing as much as 20 to 40 per cent. of slate and bone will be investigated by the fuel administrator.

A call for a more universal use of wood for fuel, as advocated by the Federal Fuel Administration, was made the subject of a statement of Mr. Potter on Dec. 31.

Through a slashing of its passenger service, by order of the Government as a war measure, the Philadelphia & Reading Ry., on Jan. 1, will virtually cease as a passenger-carrying road, and will be used until the end of the war as one of the principal freight carriers of the East.

In the vast scheme designed by the newly created Federal War Board at Washington, the Reading, in the broad sense of the war, will lose its identity and will be merged into the great system of railroads under strict Government operation.

The decision to convert the Reading came with unexpected suddenness even to its officials. One official expressed himself, as saying, "the very heart of things was ripped out bodily." Large schemes are in prospect, among them the using of the Reading line from Harrisburg to New York as a short cut to relieve the congestion on the main line of the Pennsylvania. It is understood that much of the freight from the West going over the Pennsylvania will be switched off at Harrisburg to the Reading lines, where it will be carried into New York by way of the Reading, Allentown and thence over the Jersey Central or the Lehigh Valley.

The most important use to which it is expected the Reading will be utilized will come in handling a major part of the coal business. The Reading is the largest anthracite-carrying road in the country. Its 1100 miles of track reach practically the richest coal beds in the state. Strategically situated, it can shoot its product into any center. It has a direct line to Philadelphia; it can reach Chicago and the West by its connections with the New York Central; New York over both the Lehigh Valley and New Jersey Central, which it controls. It can ship to New England or to the South with almost equal ease, either by rail or water.

The first real evidence of Federal control of railroads came on Dec. 31, when the Delaware, Lackawanna & Western R.R. hauled over its line 200 trains of empty Erie coal cars from Bergen Junction to No. 6 Junction, just outside of Scranton, and there turned the cars over to the Erie to be loaded at the mines of the Erie company.

PENNSYLVANIA

Anthracite

McAdoo—It is reported here that the Lehigh Valley Coal Co., which a score of years ago operated the York Farm colliery, in the western part of Schuylkill County, abandoning it because of excessive water and gas, purposes shortly to start removing the culm banks, which, it is estimated, are worth a half million dollars. Repeated efforts have been made by private interests to get possession of these banks, which contain valuable sizes. The Lehigh Valley Coal Co. has but one other interest in the lower anthracite field and that is at Blackwood, several miles further west. This is a profitable operation, which ships annually between 300,000 and 400,000 tons.

Minersville—The Heilner culm bank is to be utilized by the Philadelphia & Reading Coal and Iron Co., which has already installed a steam shovel for the purpose of removing the deposits, which contain much valuable coal of steam sizes, from the Wolf Creek branch to the Schuylkill Haven and Pine Knot breakers, for preparation for market. Valuable banks directly in the town of Minersville near the high school building are also to be removed.

Reading—Reading coal dealers have been given a jolt by local Fuel Administrator Acker, who ruled that persons buying coal and having it hauled away in their own wagons or at their own expense must get a 60c. instead of 25c. discount per ton. The dealers said it cost them $1.50 to deliver a ton of coal, but allowed only 25c. to persons who brought their own vehicles. The allowance of 60c., though better than 25c. a ton, means nothing to the average

consumer. He could not begin to get a man to haul his coal for $1 a ton, vehicles for hire being scarce.

Georgetown—A big drive on the mine workers started on Dec. 26, and will continue for some time, during the payday period. The unions are enthusiastically back of the Red Cross, and have offered to help the movement, and are making an effort to have every union member join the Red Cross. The Lehigh & Wilkes-Barre Coal Co. has requested a thousand more buttons to use along with the 5000 it has already taken.

Shamokin—The fire at the Susquehanna Collieries Co.'s Scott mine, believed to have been extinguished Christmas morning, broke out afresh early on Dec. 27 and is raging fiercely in a solid pillar of coal. An entire section of the mine will be sealed off to smother the flames. The fire is 1800 ft. below the surface, in No. 4 vein, a gaseous portion of the mine. It is the belief of the officials that the fire ate its way through a small leader beyond the range of the heavy streams of water. There, fanned by the air currents, a serious fire developed, necessitating a change of fire-fighting tactics. Once the fire district has been sealed, the company will place the men thus idle in other portions of the mine, in order to keep up the colliery production.

Lansford—The men employed by the Lehigh Coal and Navigation Co. throughout the Panther Creek Valley to work in the mines and collieries, at monthly salaries, received increases of 25 per cent. when the miners received an increase of 35c. a ton for coal mined. The Susquehanna Collieries Co. on Christmas Day presented its office employees and engineers with checks ranging from $10 to $200.

Wilkes-Barre—A washhouse in the yard of the South Wilkes-Barre No. 5 colliery was slightly damaged by fire on Dec. 27. A call was sent in for the city fire department to protect the large breaker, but the fire was put out by the miners before going inside the mines.

Mount Carmel—Through the scarcity of male labor at the mines of the Susquehanna Collieries Co., Mrs. Cora Van Gasken becomes the first weighmistress in the anthracite region. Mrs. Van Gasken has been placed in charge of weighing coal at the Cameron colliery. At the same time the company announced the appointment of seven other women and girls in clerical positions.

Edwardsville—The Kingston Coal Co. on Christmas Day presented scores of children and widows of miners who had been killed in the mines of the company with cash donations, sweaters, reefers, gloves and other articles of clothing.

Bituminous

Holidaysburg—James Hutton, Sr., a Philadelphia banker, on Dec. 26 purchased the Homestead mine in Clearfield County. Its output of coal will be solely used to keep the big dye plans in Philadelphia going. Other Philadelphia manufacturers, impelled by the coal shortage, are negotiating the purchase of coal mines in the Allegheny Mountains.

Philipsburg—While the miners' union of Beccaria was meeting on Dec. 24, an attempt was made to blow up the building in which the miners were assembled. The explosion, which did much damage to property in that vicinity, must have been premature. A number of miners found a 12-ft. fuse sputtering its way toward several sticks of dynamite.

Heshbon—The first shipments of coal from the new Stanley mines of the Stanley Smokeless Coal Co., at Dias, were made the past week. It is located on the Cambria & Cresson branch of the Pennsylvania R.R. and shipments can be made via P. R.R. and B. R. & P. John Madill, formerly with the Savan Colliery Co., is general superintendent of the new company. A store building and 25 miners' houses have been built.

Connellsville—The Clark Coal Co. has purchased and taken over all the holdings of the Smithfield Coal and Coke Co., at Outcrop. The deal includes about 100 acres of coking coal, 34 coke ovens and the entire mining plant. E. C. Higbee is president of the new company.

Indiana—Vernon F. Taylor, of this city, has sold two of his new operations. The Caldwell Smokeless Coal Co. mine and the Black Lick Coal and Coke Co. mines located on the Black Lick branch of the Pennsylvania R.R. have been sold to Campbell, Peacock & Kinzer, of Philadelphia. The new owners will enlarge the plants and greatly increase the tonnage of both mines. The consideration was not made public.

Plumville—It has just been made public that the Consolidated Coal and Coke Co. has purchased 31 tracts of coal land in South Mahoning and Washington townships, Indiana County, containing about 5000 acres of coal. The company has also purchased several houses in Plumville and the surface of the A. H. Miller heirs' farm, where it will erect a modern mining town. Work has been started on the construction of a siding connecting with the Buffalo & Susquehanna R.R. The considerations were not made public. Wallace B. Chapman, of Indiana, Penn., is local attorney for the new company.

WEST VIRGINIA

Teter—The electrical plant of the Pleasant Valley Coal Mining Co. is practically completed. It is expected that the plant will soon be in operation.

Downs—Some fine miners' houses are being erected by the Bertha Coal Co. at its plant near Downs, Marion County. About 75 houses are nearing completion. A total of 225 houses are to be erected.

OHIO

Lectonia—A mysterious fire at the Delemore mine is being investigated by Federal agents, it is reported, on the theory that the fire was caused by alien enemies. The blaze destroyed the power house at the mine and crippled the operation to such an extent that it was necessary to close down for the time, thus eliminating 250 tons daily production. The fire was similar in its starting place and effect to several other blazes which have destroyed coal-mining equipment and machinery, forcing shutdowns, and Federal authorities are becoming aroused. Operators are now being urged to throw armed guards around their properties.

Parlett—The Wayne Coal Co. held a Christmas tree celebration and entertainment for its employees and their families Saturday evening. H. D. Patterson, general superintendent of the company, delivered an address, thanking the men for their coöperative service. A band from Cadiz, Ohio, and a quartet from Pittsburgh furnished music. Every one of the 600 guests received a gift at the close of the celebration.

INDIANA

Brazil—The new mine of the American Coal Co., of this city, which is being sunk south of Bicknell, will be the largest in the state and will have no boiler house. The machinery will be operated by electricity supplied from a power station at Edwardsport. The mine will have a normal daily capacity of 5000 tons, as compared with 3000 tons a day, the normal capacity of the present American Coal Co. mine No. 1, southwest of Bicknell.

ILLINOIS

Carlinville—Construction work at the proposed site of the two new coal mines of the Standard Oil Co., six miles northeast of Carlinville, is progressing favorably in spite of the cold weatner. A gang of Italian workmen are engaged in laying and surfacing tracks from the Chicago & Northwestern R.R. to the yard tracks of the proposed mines. Houses are to be built to quarter the laborers during the period of construction. A boarding house and commissary will be installed as soon as the houses are finished.

Cuba—The work of opening the coal mine on the Lacky and Vliet farm is progressing nicely. William Gagg is superintending the work. A large amount of coal has been located in the vicinity of the mine.

Christopher—A commission has been appointed to investigate the recent explosions that have occurred lately in the coal mines of southern Illinois. The personnel of the commission is as follows: Coal Operators—Rice Miller, of Hillsboro; James Forester, of DuQuoin, and Archibald McLaren, of Marion. Miners—Ben Firth, of Gillespie; T. J. Reynolds, of Collinsville, and Thomas Clayton, of Benton. Department of Mines and Minerals—Frank Rosbottom, of Benton; Joseph Thompson, of Murphysboro, and T. Bannister, of Herrin.

Zeigler—The Zeigler mine, in which an explosion occurred three weeks ago, killing 17 miners, has been sealed since the explosion and, according to Evan John, director of mines and mining, cannot be reopened for about two weeks. Seven hundred men are out of work. It is expected that the Christopher mine, in which there was an explosion more recently, will be ready for reopening in a few days.

Staunton—The Consolidated Coal Co., threatened with water shortage by the exhaustion of its reservoir supply, is sinking wells in the hope of obtaining a sufficient supply, and is also preparing to pipe water from Cahokia Creek.

Edwardsville—Drills have been placed in operation on the farm of Rudolph Frickenstein, east of here, in a large development enterprise financed by a syndicate. Six borings have been made, but the results will not be divulged until the data have been laid before the syndicate members for final action. The tract on which options have been taken contains about 12,000 acres.

Granite City—Steps are being taken to organize a coöperative society and open a store here. Duncan McDonald, secretary of the Central States Coöperative Society, is advising with local union leaders.

Foreign News

Brantford, Ont.—A municipal coal-distributing office was opened on Dec. 24 under control of an Advisory Committee, on which the coal dealers are represented. All consumers must obtain orders from the municipal office on a dealer and none are served who have more than a week's supply on hand. Orders are only issued for one ton to one-quarter-ton lots. Purchasers are permitted to name their dealer and if he has none on hand the order is placed with the nearest point of distribution.

Toronto, Can.—The Canadian Board of Railway Commissioners at Ottawa has given a decision authorizing a general increase in freight and passenger rates. The reason assigned is the higher cost of coal labor and materials. Passenger rates are increased 15 per cent. with the exception of British Columbia, and freight rates approximately 10 per cent. in the West and 15 per cent. in the East, subject to certain specific limitations. On coal a flat increase of 15c. per ton is allowed, it being considered that this will bear less hardly on the consumer than a percentage increase. In the Western hearings held by the Commission the evidence was to the effect that a flat increase was preferable to the percentage asked by the railways. The date on which the increased rates will come into effect is not specified, as the railways will have to file new tariffs based on the judgment which must receive approval. This may require some weeks.

Berne, Switzerland—In anticipation of having to struggle along with 200,000 tons of coal less a month, the Swiss Government has cut to the bone the railroad traffic, raised rates and made it so difficult and so expensive to travel that only necessity is apt to induce a Swiss to move from one part of his tiny country to another. This step is due to the fact that Germany's initial delivery for September, under the new economic agreement, has fallen many thousands of tons short of the promised minimum of 200,000. The Swiss government also has issued drastic regulations concerning heating. The sale of certain types of electric stoves was forbidden, while electricians were forbidden to install new switches and lines such as would be necessary for utilizing stoves. Hotels and mansions may heat only one-quarter of their rooms and must close their cafes and restaurants at 11 instead of 1 o'clock. The hours of opening stores are reduced.

Personals

H. K. Stauffer, who has been associated with B. Nicoll & Co., 149 Broadway, New York City, as special agent, in charge of the concern's Johnstown office, has been appointed manager of the Pittsburgh office.

F. E. Bedale, Mount Pleasant, Penn., has been named inspector of bituminous coal mines for the compensation insurance authorities at Johnstown. Mr. Bedale succeeds Malcolm MacDougall. Headquarters will be at Harrisburg.

Charles Hall, secretary of the Indiana Coal Bureau, with offices at Terre Haute, Ind., has resigned his position, effective Feb. 15. He has been chosen head of the Bledsoe Coal Co., of Terre Haute. His successor has not yet been selected.

A. S. McQueen, of B. Nicoll & Co., 149 Broadway, New York City, has resigned his position with that firm to take up business on his own account. He will be associated with W. W. Keefer, First National Bank Building, Pittsburgh, Pennsylvania.

W. S. Blythe, of Homer City, Penn., superintendent of the Tide Coal Mining Co., has been promoted to general superintendent of the mines of the Tide Coal Mining Co. and the Coal Run Mining Co. mines. Mr. Blythe will have his headquarters at Indiana, Pennsylvania.

George S. Cokley, superintendent of Cummings shaft, of the Jefferson and Clearfield Coal and Iron Co., has been made superintendent of the mines of the Tide Coal Mining Co., at Homer City, Penn. Cummings shaft has been placed under the supervision of W. M. Downer, superintendent of the Ernest mines of the Jefferson and Clearfield Company.

Joseph Cochrane, formerly superintendent of the Burrell mine, at Firestone, Colo., has accepted a like position at Klondyke mine, of Pike View, Colo. Mr. Cochrane is a mining engineer of considerable experience. He had charge of the Puritan mine during the sinking and equipping, and was then transferred to the Monarch No. 2 mine, owned by the same company, the National Fuel Co. At the examination held in Denver last July for mine inspector, Mr. Cochrane was second highest in percentage.

Obituary

Paul B. Cosgrove, partner in the firm of Cosgrove & Co., one of the best-known coal-operating organizations in the country, died Dec. 21, in Johnson City, Ill. Mr. Cosgrove, though only 28 years of age, held an enviable place in the coal world. He is survived by his mother, a sister and three brothers.

James A. Phillips, of Cleveland, Ohio, who was recognized as a man of honor and integrity among the coal dealers of Ohio, passed away on Wednesday, Dec. 26. Mr. Phillips was at one time manager of the Windsor Coal Co. and the Steiner Coal Co., and for the past three years had been with the Lake City Coal Co. His death is keenly felt by his friends and business associates.

John Thomas Morgan, president of the East Pratt Coal Co., of Birmingham, Ala., died at his residence in that city on Dec. 25, after a brief illness. Mr. Morgan had been in the Birmingham district for the past 40 years, most of which time he was engaged in the development of coal-mining interests, and owned valuable coal lands in Bibb County in addition to properties of the East Pratt Coal Co., in Jefferson County, on which is located the Clift mine.

Lafayette Lentz, aged 89, a prominent resident of Mauch Chunk, Carbon County, Penn., and well known throughout the anthracite coal region, died on Dec. 29 of general debility. He was born in Northampton County, but spent nearly all his life in the Panther Creek Valley. Mr. Lentz had a wide reputation as a coal operator and railroad builder, doing most of the work in driving tunnels for the Lehigh Valley R.R. and successfully completing contracts for several other large railroads. In 1868 he became extensively interested in coal-mining operations and was active in the firm of Lentz, Bowman & Co., Lentz, Lilly & Co. and also the firm of L. A. Riley & Co., operating mines at Park Place.

New Patents

Briqueting Machine. T. Gilmore, Jr., assignor to General Briqueting Co., New York, 1,247,667. Nov. 27, 1917. Filed Feb. 6, 1917. Serial No. 146,873.

Fuel Saver and Smoke Consumer. L. D. West, Denver, Colo., 1,247,761. Nov. 27, 1917. Filed Nov. 15, 1916. Serial No. 131,416.

Dump Car. W. L. Burner and J. D. Benow, assignors to Kilbourne & Jacobs Manufacturing Co., Columbus, Ohio, 1,247,412. Nov. 27, 1917. Filed Jan. 8, 1917. Serial No. 141,252.

Furnace Construction. C. A. Hammel, Los Angeles, Calif., 1,248,321. Nov. 27, 1917. Filed Oct. 9, 1916. Serial No. 124,635.

Mechanical Stoker. G. O. J. Kleven, Salt Lake City, Utah, 1,247,969. Nov. 27, 1917. Filed Nov. 15, 1916. Serial No. 131,575.

Ventilated Interlocking Clinker Bar for Furnaces. O. C. Woolson, New York, N. Y., 1,248,048. Nov. 27, 1917. Filed Aug. 10, 1916. Serial No. 114,117.

Automatic Stopping and Releasing Device for Mine Cars. G. M. Johnson, McDonald, Penn., 1,249,106. Dec. 4, 1917. Filed July 6, 1917. Serial No. 178,998.

Coal-Delivering Apparatus. G. W. Freeland, assignor to Williams, White & Co., a corporation of Illinois, 1,248,473. Dec. 4, 1917. Filed Oct. 10, 1914. Serial No. 866,008.

Publications Received

Cost Accounting for Oil Producers. By Clarence G. Smith. Department of the Interior, Bureau of Mines. Bulletin 158, Petroleum Technology 43. Unillustrated, 117 pp., 6 x 9¼ in.

Blast-Furnace Breakouts, Explosions and Slips, and Methods of Prevention. By F. H. Willcox. Department of the Interior, Bureau of Mines. Bulletin 130. Illustrated, 267 pp., 5⅞ x 9¼ in.

New Tertiary Mollusca Occurring in New Zealand. Accompanied by a few notes on necessary changes in nomenclature. Part I. By Henry Suter. New Zealand Department of Mines, New Zealand Geological Survey. Palaeontological Bulletin No. 5. Illustrated, 93 pp. of text and 13 plates, 8½ x 11 in.

Industry, Society and the Human Element. A Few True Detective Stories That Are Interesting and Instructive. Sherman Detective Agency, Inc. Illustrated, 80 pp., 6¼ x 9¾ in.

This eighty-page book explains the successful methods which Mr. Sherman employs in eliminating discord and promoting harmony between employer and employee. It contains many features valuable to executives at this time and will be sent to executives who request it on their corporation's letterhead. The main offices of the "Sherman Service" are at 20 Broad St., New York City; 208 So. LaSalle St., Chicago, Ill.; 10 State St., Boston, and 42 Church St., New Haven, Conn.

Industrial News

Harrisburg, Ill.—The Saline Gas Coal Co. has been incorporated with a capital stock of $150,000. The incorporators are John H. Crawford, Homer Collier and J. M. Hunsaker.

New York, N. Y.—At a meeting of the board of directors of the Worthington Pump and Machinery Corporation, 115 Broadway, New York, C. P. Coleman was elected as the company's president.

Lincoln, Ill.—The Logan County Fuel Committee has allowed an increase of 30c. a ton for coal at the mines of the county, for local use, making the price $2.95 instead of $2.65. The delivery charge is 60c. a ton.

Columbus, Ohio—The Olmstead Coal and Mining Co. has been incorporated with a capital of $125,000 to mine and sell coal. The incorporators are R. E. Westfall, E. K. Merwine, N. K. Bales, A. G. Price and James Judge.

Gowan, Okla.—The No. 2 Coal Co. has been organized with a capital stock of $10,000, for the purpose of developing some coal-land leases in this section. The incorporators are W. K. Hudson, W. H. Watson and J. G. Anderson, all of Gowan.

Niantic, Ill.—The Carbon Coal Co. has applied for incorporation papers in Illinois. The capital will be $100,000. David W. Beggs, Jessie M. Corzine, Frank D. Shields, Daniel Macknet, Chester W. Russell and Benjamin W. Waggoner are interested.

Columbus, Ohio—Ohio operators are now working on the priority order of Ohio Fuel Administrator Johnson, which compels operators to load for public utilities, state and county institutions and domestic users until a two weeks' supply has been obtained.

Flemington, W. Va.—The Aster Coal Co. has been incorporated with a capital stock of $50,000 to operate mines in Taylor County. The incorporators are D. J. Carter, Harry W. Sheets, C. E. Cocke, B. B. Jarvis and G. D. Derltuc, all of Clarksburg, West Virginia.

Grafton, W. Va.—The Liberty Mining Co. has been incorporated with a capital stock of $20,000 to operate mines at Powell, Marion County. The incorporators are Edmund L. Sawyer, David L. Ross, John J. Henchner, Hugh Warner and Jed W. Robinson, all of Grafton.

Columbus, Ohio—The Ohio Public Utilities Commission has issued orders for railroads to supply wagon mines with open-top equipment. Previously orders were issued to supply only box cars to wagon operations. There are approximately 700 wagon mines in Ohio.

Athens, Ill.—The Athens Coal Mining Co. has been incorporated under Illinois law to mine and sell coal, lease, purchase and deal in coal lands and coal rights and to transact a general mining business. Joseph Hann, S. H. Cummings and Thomas W. Kenyon are the directors.

War, W. Va.—The Underwood Pocahontas Coal Co. has been incorporated with a capital stock of $100,000 to operate mines in McDowell County by H. M. Burke, F. W. Truscott, of War; C. H. Truscott, of Cleveland; George Morrow, of Charleston, and J. E. Jones, of Switchback, West Virginia.

Bokoshe, Okla.—The Gunther Coal Co. has been organized and its charter has been filed in the office of the Secretary of State at Oklahoma City. The company is capitalized at $100,000 and the incorporators are: A. P. Gunther, of Kansas City; E. R. Jones and L. W. Randolph, of Muskogee.

St. Louis, Mo.—State Fuel Administrator Crossley has issued orders that coal cars reaching St. Louis in the morning must be unloaded the same day and the railroads must haul the empties away that night. Coal dealers are asked to report failure of the railroads to promptly remove the empties.

Hillsboro, Ill.—The coal properties of the Chicago & Eastern Illinois Railroad Co. were sold under foreclosure recently in favor of the Central Trust Co., of New York. The holdings consisted of two mines at Witt, Ill., and was bid in by the trustees for the bondholders, for debt, interest and costs.

Springfield, Ill.—The Sangamon County Fuel Committee has fixed $3.75 as the maximum price to be charged consumers, made up as follows: Price at mouth of mine, $2.65; allowance to operator for delivery at wagon chute, 30c.; delivery to consumer, 80c. The price has been approved by State Fuel Administrator Williams.

Pemberton, W. Va.—The Beard Smokeless Coal Co. has been incorporated with a capital stock of $100,000 to operate mines in Shady Springs district, Raleigh County. The incorporators are Prince E. Lilly, John R. Hornbrook, of Lillybrook, W. Va.; C. E. Lilly, of Fioco, W. Va.; Frank Beard and Estel Bryant, of Pemberton.

Charleston, W. Va.—A corporate charter was issued by the Secretary of State to the Cabin Creek Block Coal Co., of Ronda, W. Va., to operate mines in Kanawha County; capital stock, $100,000; incorporators George W. McClintic, W. G. Mathews, B. Stanley Gill, J. R. Hayes and B. D. Truslow, all residents of Charleston.

Coulterville, Ill.—The McKinley Coal and Mining Co. will install a million-dollar plant in this vicinity, where it has 1666 acres of land. The company has two veins of coal, running 6 ft. deep. The mine will be on the Illinois Southern R.R. and will be two miles from the Illinois Central. From 3000 to 4000 tons a day will be mined.

Lima, Ohio—Because of a shortage of coal, the entire City of Lima has been in darkness for a week. The electric-light plant was compelled to shut down, and as a result all street lights and lights in 2000 homes were turned off. There was considerable suffering from lack of coal reported in certain sections of the city.

Norton, Va.—The MacClanahan Coal and Coke Co. has been incorporated with a capital stock of $30,000 to operate mines in Wise County, Virginia. The incorporators are William MacClanahan, of Tralee, W. Va.; K. S. MacClanahan, of Amigo, W. Va.; F. S. Kits, of Beckley, W. Va.; Eli Noneff and W. S. Thompson, of Mullens, West Virginia.

Clayton, Mo.—St. Louis County coal dealers are getting just about half the cars of coal that are shipped to them. Since Dec. 1, according to Samuel Hodgdon, chairman of the County Fuel Committee, the dealers have received 63 cars, and 64 cars are in transit. He says that a car loaded at Herrin, Ill., for the Clayon Supply Co. has been on the tracks there 21 days.

Buffalo, N. Y.—In connection with the taking over of the Niagara Falls water-power plants, it is stated that the Government has asked the Buffalo General Electric Co. to build on the Niagara River below this city a 50,000-hp. steam plant in addition to the one which it already has there. All will be used to generate electricity for operating street railways and electric-light plants.

Pana, Ill.—State Fuel Administrator Williams and County Fuel Administrator Hoover have been investigating alleged excessive charges by the three Pana coal-mining companies. Testimony has been taken under oath and comparison is to be made with rates charged elsewhere. It is alleged that

the companies have been charging more than companies at Staunton, Gillespie and Springfield.

Fairmont, W. Va.—Coal men of Fairmont and vicinity gathered at the Fairmont Hotel, Jan. 2, when a club was organized similar to those existing at other coal centers. It is to include coal men from every mine in Marion County and nearby points, who will dine together once a week with a view of exchanging ideas. A. Brooks Fleming, Jr., of the Consolidated Coal Co., was active in the formation of the club.

Reading, Penn.—Ernest J. Poole, general superintendent of the Carpenter Steel Co., has sent to every one of his 2200 employees who in any way handles fuel a letter asking him to aid in a program of coal saving. The company is working night and day. It must have 5000 tons of coal a month, and in the face of a serious shortage every fireman, heater or other man who uses a coal shovel is asked to use the utmost care.

Columbus, Ohio—Mayor Karb, of Columbus, has vetoed the ordinance providing for the establishment of a municipal coal yard, The ordinance was fathered by Councilman Zimpfer, a Socialist member. It provided for the location of the yard on a site between the Hocking Valley and Toledo & Ohio Central tracks. In his veto Mayor Karb said that he believed the Columbus pool will be sufficient to take care of Columbus.

Wheeling, W. Va.—The Liberty Transit Co., organized recently to operate boats and barges on the Ohio River, has completed its organization by the election of J. C. McKinley, president; Charles M. Ketchum, secretary, and Robert Hazlett, treasurer. A long list of directors has been selected. It is planned to operate boats for the transportation of coal and other badly needed commodities. Operations will be started in the early spring.

Benton, Ill.—The Murphysboro & Southern Illinois Railway Co. has made application to the Illinois Public Utilities Commission for permission to issue $63,000 capital stock and $250,000 in bonds to meet the cost of extending the line from Carbondale to Carterville, connecting with the Coal Belt line, or to extend the line on to Herrin through the rich coal fields of Williamson County. The road is now in operation between Murphysboro and Carbondale.

Cincinnati, Ohio—The final decree of the United States District Court in the case of the Ottto Marmet Coal and Mining Co. against Dredgeboat Northern No. 2, with the other parties involved, has been handed down, confirming the report of the special master appointed, and finding that the Marmet company sustained damages of $2775.93, while the dredging company sustained damages of $1663, to be paid by the Marmet company. Costs are divided.

Alton, Ill.—The Alton Fuel Committee has announced that in determining the prices which retail dealers will be allowed to charge for coal the following allowances will prevail: For wastage and stealage, 16c. per ton; for delivery, 75c. per ton; for overhead, 50c. per ton; for net profit, 25c. per ton. As it costs $3.34 a ton for coal on track at Alton, this means a retail price of $5 a ton. An extra cent or two per bushel will be allowed on sales in smaller quantities.

Columbus, Ohio—The Stalter & Essex Co., of Columbus, has filed charges against the Kanawah & Michigan R.R., alleging that during the month of December only 73 cars were supplied to the mines of the company, which have a capacity of 100 tons daily. It is claimed that other mines on the road have the same percentage of cars and discrimination is not charged. It is charged, however, that the road discriminates against Ohio mines in favor of West Virginia operations.

Morea Colliery, Penn.—The Dodson interests have combined their bituminous, anthracite and real estate purchasing departments under one management. These are now located in the company's new office building at 26 South New St., Bethlehem, Penn. P. J. Malloy will remain purchasing agent, and J. B. Connell, previously general superintendent of Morea and Beaver Brook collieries, is now general purchasing agent and manager, with offices at Bethlehem.

Cincinnati, Ohio—Several local coal companies, including the Reliance Coal Co., as well as several large industrial consumers, have complained of the action of Wiley B. Bryan, of Louisville, Kentucky fuel commissioner, in confiscating in Kentucky coal consigned to them, charging that this action has resulted in suffering in Cincinnati. The matter will be caried direct to the Federal Fuel Administration in order to prevent further diversions of Kentucky coal en route to Cincinnati.

St. Louis, Mo.—St. Louis coal operators have donated 26 cars of coal to be distributed to the city's poor. The donations were obtained by a committee of the St. Louis Coal Club, of which John Henderson, of the West Virginia Coal Co., was chairman, and reported to E. J. Wallace, secretary of the club. The value is between $3000 and $3500 at the mine, freight $780 and delivery $520. Jobbers are to absorb the freight charge and dealers will make the deliveries free on the orders of the charity organizations.

Columbus, Ohio—The Columbus Coal Shippers' Terminal Pool Association, of which B. F. Nigh is manager, was launched Jan. 1. Blanks had been sent to all shippers to the pool and offices were opened in the Brunson Building. C. W. Pinney, an expert railroad man, was selected as chief assistant to the director. Charles Moriarity, the director of all the pools in the Middle West, is expected to arrive in Columbus soon. Classifications of all coal to be handled by the pool has been made and all details of accounting have been arranged.

Troy, N. Y.—A vein of soft coal was struck at the Watervliet arsenal on Dec. 27 by workmen who were making an excavation for a new shrinkage pit. The find was made at a depth of 125 ft. and is regarded as genuine bituminous coal, responding to the usual tests. The deposit is located so far down as to preclude what was found being coal from the gun foundries scattered about the reservation at some previous time. The find is looked upon as of the highest importance because the scarcity of soft coal has been felt with particular severity in this locality.

Salt Lake City, Utah—The State Fuel Administration announces the opening soon of three new Utah mines: The Weber, near Coalville; the Wattis, in Carbon County, and the Peerless, of the Standard group, also in Carbon County. In addition, coal deposit owners at Fillmore and Cedar City are urging railroad connections. The Weber is owned chiefly by Clarence and Ernest Bamberger, of Salt Lake City, and is well equipped with modern machinery. The Wattis, financed by Wattis & Wattis, of Ogden, is expected to ship a dozen cars daily after Jan. 1.

Carbondale, Penn.—The Delaware & Hudson Coal Co., in an effort to assist in relieving the coal shortage, has adopted a plan which provides for the taking of all outside workmen from collieries between Plymouth and Carbondale and putting them at work loading cars for shipment. This plan will be followed out Saturday afternoons and every Sunday and whenever the collieries are not working. It is estimated that at present the company has about 200,000 tons of coal in its storage plant which it is impossible to move to market on account of the lack of labor and cars.

Princeton, W. Va.—E. B. Farley, of Spanishburg, and Mayor Davis Thorn, of Princeton, filed suits recently against a group of coal companies for $10,000 damages each, alleged by reason of dumping of cinders into Bluestone River to be washed onto the plaintiffs' farms. A number of settlements between coal companies and Bluestone land owners in the past few years have been made on the same grounds, it is said. The defendants to these two suits are the Crystal Coal Co., American Coal Co., Louisville Coal Co., Ennis Coal Co. and the Turkey Gap Coal Co.

St. Louis, Mo.—Edward A. Fresen, fuel administrator of Madison County, Illinois, has put a stop to mine owners in his territory organizing real or make-believe retail concerns for marketing their output. He found operators in Edwardsville selling coal at $3.75 a ton. They explained that they had organized retail companies which had contracted for their entire output. He gave them until the following morning to dissolve their retail companies, with the alternative of having a Federal agent take charge of the mines. By the next morning the retail companies had been dissolved and the mines were selling at the legal price.

Jefferson City, Mo.—In order to prevent confiscation by railroads of coal shipments destined to points in Missouri and Kansas, an agreement has been reached between the fuel administrators of the two states, representatives of the railroads and officials of the Southwestern Coal Operators' Association that such shipments shall be labeled "Emergency." Stickers bearing the words "Emergency Shipment" are to be attached to the waybills and the cars. It has also been decided to forward to Robert S. Lovett, director of priority transportation, a joint protest against the requisitioning of equipment from Western lines for the Atlantic seaboard.

Evansville, Ind.—Articles of incorporation for the so-called municipal coal mine of Benjamin Bosse, mayor, were filed in the county recorders' office here recently. At the same time Mayor Bosse incorporated another mine at Buckskin, Gibson County, which he will operate as a private venture in partnership with Walter Korff. The "municipal mine" will be operated by the Bosse Coal Co., the incorporators being Mayor Bosse, Walter Korff, manager, and John R. Brill, city attorney, as attorney. The capital stock of the company is placed at $100,000. The mine is being opened near Chandler, in Warrick County, a few miles east of here.

Cincinnati, Ohio—Heavy ice in the Ohio River, which has formed gorges at several points, is not only barring further river traffic for the time being but is threatening seriously the coal supply of various river coal companies, stored in barges along the Ohio. No sudden break in the gorges, similar to that of some days ago, has yet occurred, but if a thaw should happen in a few days some similar difficulties will be encountered. On the other hand, companies receiving their coal by river have little coal left on hand, on account of the interruption to river shipments for some days past. The ice is very deep and runs from above Cincinnati to Madison.

Columbus, Ohio—On recommendation of George C. Holt, referee, judgments in the amounts of $2,757,465 and $86,576 against the Hocking Valley Railroad Co. were filed in New York in favor of Daniel E. Pomeroy, Walter Buckner, Lewis L. Clark and Stacy G. Richmond. It was alleged that the railroad company had guaranteed payment of 3500 bonds for $1000 each issued by the Kanawha & Hocking Coal and Coke Co. in order to facilitate the sale of the bonds. About two-thirds of the bonds passed into possession of the plaintiffs, who sued upon the railroad company's guarantee when the coal and coke company failed to meet its mortgage obligations.

Greensburg, Penn.—An agreement for the consolidation of the Westmoreland Coal Co., the Penn Gas Coal Co. and the Manor Gas Coal Co., dated Dec. 4, has been filed in the recorder of deeds' office here. The directorate of the three companies is identical. The main offices of the companies are in Philadelphia, while the mines are located in Westmoreland County. The name of the merged company will be the Westmoreland Coal Co. and its officers and directors will be: President, S. Pemberton Hutchinson; vice president, George McCall; secretary, Howard R. Yearsley; treasurer, Herman Roll, all of Philadelphia. The company has been recapitalized at $10,000,000.

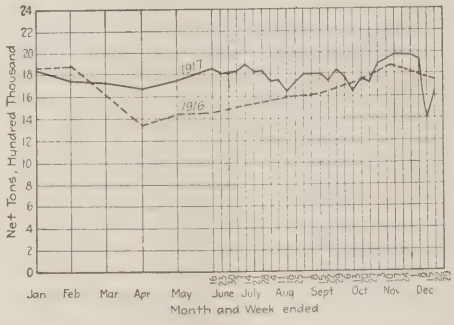
Cincinnati, Ohio—Col. Lansing H. Beach, of the United States Corps of Engineers, in charge of river improvement on the Ohio, has asked the aid of the Chamber of Commerce in a plan for compiling statistics showing the probable amount of freight which is available for river shipment, in order to encourage the formation of companies to operate boat lines on the Ohio. The Government, through the engineers and local commercial bodies, intends to coöperate with shippers by using every effort to secure for them facilities for moving freight by river, in view of the heavy congestion of traffic on the railroads. The Chamber of Commerce, through its traffic bureau, is responding by making a thorough canvass of Cincinnati business men, and a large mass of data on the subject will be collected.

Dallas, Tex.—Coal operators of Oklahoma and members of the Choctaw and Chickasaw Indian tribes are much elated over the passage by the National House of Representatives of the bill by Representative Carter, of Oklahoma, providing for the sale of the mineral lands in Oklahoma owned by these two tribes. Coal operators believe the sale of these lands, amounting to more than 400,000 acres of coal lands located in the vicinity of McAlester and several thousand acres of asphalt deposits near Ardmore, will greatly stimulate the coal-mining industry in Oklahoma. Approximately 100,000 acres of the coal lands are now under lease, but the remaining 300,000 acres are undeveloped. An appraisement made some years ago placed a value of $12,000,000 on the coal available on this land. Under the terms of the bill, the Secretary of the Interior is authorized to formulate rules and regulations for the sale. The appraisement is to be completed six months after the appointment of appraisers. The lands are to be advertised and sold at public auction 90 days after the report of the appraisers has been submitted. At the expiration of the first year, the remaining unsold land and any forfeited land is to be again offered for sale to the highest bidder. An appropriation of $50,000 is made to cover cost of appraisement and sale of the lands.

MARKET DEPARTMENT

GENERAL REVIEW

Excessive cold causes sharp increase in domestic demand. Industrial conditions in New England becoming critical. Government takes steps to relieve local domestic shortage.



Anthracite—The production of anthracite was naturally slightly curtailed last week on account of the holidays. This curtailment, however, was not as great as is often the case, since many of the miners observed only Christmas Day and did not take the three days to two weeks' lay-off which they frequently do at this season of the year. The intense cold which descended upon the eastern portion of the United States with temperatures in many instances well below the zero mark, and exceptional for this territory, coupled with a decided shortage of fuel throughout the East generally, caused considerable suffering in many localities. So far as is known, little advantage was taken of the stringent conditions by small retailers to boost the price to exorbitant levels. One or two instances of this kind have, however, come to light, and the offenders were promptly arrested. The larger towns and cities, while suffering to a considerable degree, were probably not in as bad condition as some of the country districts. Centers of dense population, such as New York and Philadelphia, may be relieved of coal scarcity much more easily than where the population is scattered. The orders of Secretary McAdoo throwing open to coal traffic the passenger tunnels of the Pennsylvania R.R. under the Hudson River will doubtless do much to relieve fuel scarcity in some of the boroughs of New York City.

Bituminous—The demand for bituminous coal shows no signs of lessening or abating. The steam demand, which has for months been insistent, is now quite as much so as ever. Many industrial plants, some of them engaged in war munition work, have been compelled to shut down for more or less extended periods, while many others are operating on a day-to-day supply. As has been the case heretofore, much of this stringency could be relieved if transportation facilities were available. There is little question but that New England, which ordinarily gets a large portion of its soft coal by water will this year be compelled to ship it in all-rail from the mines of Pennsylvania and West Virginia. There is not, and of necessity will not be, much choice exercised as to the grade or quality of coal to be secured. What is needed is something that will burn and make steam. It makes little difference whether this is slack, run-of-mine or lump. The price is, and has been for some time, an entirely secondary consideration. Transportation facilities have also been considerably affected by the cold weather throughout the Middle West. In this region many mines are working two or three days per week, where the operators and miners would gladly work them six or possibly even seven days per week if cars for loading could be secured. It is yet too early to say what government control of the common carriers will do to relieve the situation, but it is strongly hoped that a gradual improvement will take place. Many schemes have been brought forward, tending toward the conservation of fuel. Among the most prominent means is that of lightless nights. In many cities one or two such nights are observed each week, while it is strongly urged that at least six be observed in the future. Lightless nights at present means the abolition of glaring electric signs and similar electrical displays. In many instances the abolition of street lighting, either wholly or in part might well be followed. It would appear that at least when the moon is full, or nearly so, and the ground is covered with snow, there is little real need for street lighting except at dangerous street crossings and similar localities. Throughout the entire country there is a decided and insistent demand for both domestic and industrial fuel.

A Year Ago — Anthracite stocks at a minimum and the situation is threatening. Negotiations on new bituminous contracts at $3 and better. Railroads confiscating coal and placing more rigid embargoes. A shortage of famine proportions threatened in the Middle West.

COAL PRODUCTION

The depression in the bituminous industry caused by prolonged cold weather continued during the week of Dec. 22. The total production of soft coal (including coal made into coke) is estimated as 9,917,145 net tons. This, although a substantial recovery when compared with the preceding week, was still 10.8 per cent. below the output during the week of Dec. 8. The average production per working day was 1,652,858 tons, as compared with 1,638,513 tons

during mid-August, at the time of the coal strikes in Illinois and the southern Appalachians. Beehive coke reflected the recovery in the entire bituminous industry. The total production during the week is estimated as 545,433 net tons, an average per working day of 90,906 tons. This was still 10.4 per cent. below the production during the week of Dec. 8. Shipments reported by the nine anthracite carriers amounted to 36,060 cars, an increase of 4382 cars over the preceding week. The production of anthracite, however, was still 11.3 per cent. below the mark set during the week of Dec. 8.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

District	Dec. 1	Dec. 8	Dec. 15	Dec. 22
Bituminous : shipments, 114 roads.	182,275	198,161	149,122*	176,695†
Anthracite : shipments, 9 roads...	37,533	40,566	31,672*	36,060†
Beehive coke shipments, 4 roads...	13,055	12,509	10,335*	11,197†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

The Iron Age—The expected announcement by the President that iron and steel prices would remain in effect for three months longer was made on Dec. 28. With it came the proviso, agreed to at a meeting of steel manufacturers and the War Industries Board held the same day, that on contracts made in the next three months prices would be revised on deliveries after Apr. 1 to conform to any changes that might become effective on that date.

Bradstreets—The big feature of the week is provided by the Government assuming control of the railways, while temporary dullness in trade is the distinguishing characteristic of the post-holiday period. Inventorying is the rule and salesmen are off the road. Christmas buying in the final days of the season was markedly rushed at some markets, but fell behind at others. But underneath all is the fact that the outlook for 1918 is deemed encouraging, though not by any means ultraoptimistic, there being enough uncertainty ahead as regards world politics, not to mention high prices, to dictate caution.

The American Wool and Cotton Reporter—Quiet has prevailed in the wool market for the week under review, owing to the recent Government regulation, the holiday season and inventory taking.

The Dry Goods Economist—Coal shortage still hampers production of war munitions and of merchandise, and while some scattered improvement is noted, the general fuel situation is far from satisfactory.

Marshall Field & Co.—The current wholesale distribution of dry goods for the week shows a marked increase over the shipments for the same period in 1916. The total volume of road sales for both immediate and future deliveries has been in excess of the volume for the corresponding week a year ago. Merchants have been in the market in fewer numbers. Collections continue very good. The market on domestic cotton remains firm.

Atlantic Seaboard

BOSTON

Situation most acute. More serious than public realizes. Said to be only four days' supply in Boston. Many plants inland have shut down and bitter cold causes untold distress in cities. Fuel Administration begins to be definite about relief measures, but many difficulties in the way. Railroads themselves on narrow margins of supply. Frozen coal and ice at loading piers still further impedes shipments. Doctor Garfield's order not unexpected.

Bituminous—The coldest day on record, Dec. 30, and the worst fuel shortage known, suggest in a word the coal situation in New England. Boston retailers are driven to distraction, and on Dec. 31 had in several instances closed their doors to protect their property from angry householders. One small wharf handled 700 people during the day, giving each not over 100 lb. of pea to relieve distress overnight. Police protection is now the regular order at all the wharves where there is any coal. Bituminous is being distributed to consumers who require fuel for heaters, what anthracite is to be had being saved mostly for those who require it for small stove use. The schools have been ordered closed for three days longer. Apartment houses are hard hit by the shortage, as few have bins that are adequate.

Boston is down to 4 days' supply of all kinds, according to reliable information. A great difficulty lies in the unevenness of the supply on the different wharves. A number of dealers are entirely out, while others who have small tonnages are reserving them for their regular trade. These dealers, therefore, do not consider themselves under obligation to distribute to the customers of other dealers, and all-told it is a most acute and anxious situation.

At wholesale, conditions are only better because steam-users have a better understanding of the state the country is in and for them shutting down their plants is their only alternative. In spite of all efforts to accumulate stocks during the spring and summer the railroads themselves are down to narrower margins of supply than the public is aware. Nevertheless the roads are taking a broad-minded attitude and when cargoes are en route to relieve mills and utility plants that have either shut down or are about to, they have been given real assistance. Just recently one of the railroads gave a large paper mill permission to send a crew of men to a storage pile near Boston, 150 miles from the mill, to shovel coal aboard cars, no local labor being available.

Long delays in movement are still characteristic. A barge loaded in New York, Nov. 28, arrived in Providence on Dec. 29 and was then unable to reach the railroad discharging piers because of ice. Coal at Baltimore and all the other loading ports is frozen so hard that freeing cars is accomplished only with the greatest difficulty. Modern handling seems unable to cope with such conditions; the coal literally has to be mined out of the cars.

More than 100 bottoms are reputed to be waiting at Hampton Roads, some of them since early December. Upon cargoes for these boats a large number of plants inland are depending for supply, and conditions are decidedly serious. If there ever was a time when Government efficiency could make a showing, it is now. Officials have complained that they were lacking authority to take necessary steps, and have passed the responsibility from one to another. Now that there is unified control of railroads they are under an agency of the Government and there is opportunity to act.

It is gratifying that state fuel administrators begin to be concrete. The report comes that 500 cars at a congested switch-

ing point on the Western Maryland have been diverted from original consignments and have been ordered to Baltimore via the B. & O. for Curtis Bay piers for loading into bottoms for New England, the coal to be handled by the New England Fuel Administrator and distributed by him on arrival. A further consignment of 1000 cars, assembled from a number of operations from different roads, is reported to be promised for loading at Philadelphia or Baltimore, as may seem advisable. This coal is from West Virginia output, and is understood to come forward on the Government price, although it must be replaced to the original consignees from whom it was diverted to relieve congestion.

However, the New England Fuel Administration will have to find boats and the task will not be easy. The Shipping Board is rumored to have given one steamer at Baltimore for one trip, but coal men are not yet advised about any other boats to load what must approximate 75,000 tons. In effect, the whole arrangement means distribution by the Fuel Administration rather than through the usual channels.

Re-handling plants at Providence and Portland are being strongly advised by local fuel committees to keep such stocks of bituminous as they have for local distribution in place of anthracite, where absolutely necessary. With large plants inland, to which the rehandlers are committed by contract, on the point of shutting down, it is certainly an awkward position to be in. Emergency calls from plants other than those having contracts have had to be turned down, for dispatch at Hampton Roads is not improving. Notwithstanding this, steam users inland from Portland, for instance, are being advised not to seek all-rail shipments but to look to Portland for current supply.

This week, if there are receipts of either anthracite or bituminous by water, there are likely to be cases of seizure under the Lever Act. Single carloads in terminal yards here were seized last week, and distribution made through local dealers.

No quotations are heard in any direction. No one has coal for sale, and the outlook is pretty black. About the only ray of comfort now is the promise of milder weather, with snow!

Doctor Garfield's order of Dec. 24 in connection with the railroad proclamation of Dec. 26, was not unexpected. On every hand in the coal trade there is a disposition to coöperate to the fullest extent. A more complicated situation cannot be imagined.

Anthracite—The Providence, R. I., fuel committee granted an advance of 75c., making the present retail price $10.50 per ton of 2000 lb., sidewalk delivery. This is the largest advance yet reported, and is in recognition of extra costs.

Receipts from Philadelphia are light Tows are much hampered by severe weather while ice and slow dumping interfere seriously with shipments. In New York ports anthracite company barges are lying idle and have been for weeks while the effort was made to meet the exacting demands in New York City.

NEW YORK

New York faces a coal famine. Intense cold wave causes much suffering, but hope is seen in increased receipts and further economies in consumption. Steam coals fail in quantity and office occupants suffer. Bituminous demand increases because of hard-coal shortage. Shipping fails to improve but coal is promised. Drivers threaten to tie up deliveries.

This city has been brought face to face with the most serious coal shortage in its history and what has been feared for some time has become a reality. With the mercury down to 13 deg. below zero, which was 7 deg. lower than any previous mark in the records of the Weather Bureau, the city suffered greatly from the lack of fuel. Efforts were made by everyone in authority to relieve the situation, and although appeals were being constantly made to the Fuel Administrators, nothing could be accomplished. In the meantime the public was in need of coal.

Every effort is being made to conserve fuel and a committee representing the heat, light and power companies, consisting of Louis P. Gawtry, of the Consolidated Gas Co., F. W. Smith, of the United General Electric Co., and C. A. Gillham, of the New York Steam Co., submitted a report to State Fuel Administrator Wiggins recommending six lightless nights a week, Saturday being the only exception, for every city and hamlet in the state. This report, which was made an order, became effective on Wednesday night of this week, and shuts down all advertising signs and will reduce the number of street lights, wherever possible.

The Conservation Committee of the Fuel Administration, headed by Harry T. Peters, of Williams & Peters, is using every effort to ease conditions and have adopted the card system for the purchase of coal. John Whiteley, of Whitney & Kemmerer, a member of the committee, made a tour of the coal docks in the harbor and reported there were sufficient stocks of coal to meet actual requirements but steam facilities were not sufficient to keep the coal moving, while in the city there is not sufficient storage room to safeguard the city beyond a few days at a time. James A. Hill, of the Knickerbocker Fuel Co., No. 1 Broadway, recently added to this committee, will shortly make a report covering the bituminous trade in the city.

Arthur F. Rice, Commissioner of the Coal Merchants' Association, who will have charge of the card distribution in Manhattan and the Bronx, has promised the hearty coöperation of the dealers in the efforts to conserve fuel, and has also written the dealers setting forth the efforts being made to prevent over-purchases of coal and telling them of the coal-card system to be used.

The lack of coal was felt more in the poorer sections of the city, where a tour of the coal cellars showed that more than 50 per cent. of the peddlers were without supplies. Conditions fully as serious prevailed in other sections and dealers instead of delivering coal, disposed of their supplies in small quantities. Sunday was no exception and many of the yards were open, policemen keeping the customers in line to prevent a scramble for coal.

Failure to get coal has driven occupants of flat houses into the police courts for aid, and complaints of over-charging on the part of cellar dealers has caused the Federal District Attorney to order an investigation.

On top of the present conditions the drivers and auto operators have made demands upon the retail dealers which will aggregate increases in wages of about $5 per week. They also want inserted in the agreement a provision whereby they will receive a bonus or present of $5 at Christmas. The matter was referred to the County Fuel Administrator and will probably be adjusted without a strike.

The gas companies benefited by the stringency of the coal situation during the cold wave, demands upon them being increased by 50 per cent.

While it is believed a few days of mild weather will result in New York getting sufficient coal for its immediate needs, there are some who think the situation can best be relieved by a pooling of coal at the various docks.

Production has not been up to expectations. In addition to taking Christmas Day off, employees at some of the mines remained away for the next day. This week there was another holiday and this means a further reduction in production. The output was also reduced during the cold weather of the past week, but all companies made efforts to work steadily.

Secretary McAdoo's orders opening the Pennsylvania's passenger tunnels to coal traffic appears a wise edict. Coal entering Manhattan by this route will not be unloaded within the borough, but will pass under the city to various Long Island points. At Long Island City it may be unloaded and brought back to New York by motor truck over one or more of the East River bridges.

Buyers are ready to purchase anything that looks like coal, not even considering the size.

The scarcity of the steam coals continues and the large consumers are fearful of the outlook. During the cold weather of this week many of the big office buildings were almost without heat and some of the tenants installed oil heaters, while others, on Monday, locked their doors and went home for the day.

Instead of the high quotations for steam sizes, given a couple of weeks ago, most of the prices now asked for individual coals are close to circular. However, there is no coal to be had.

Current quotations, per gross ton, f.o.b. Tidewater, at the lower ports, are as follows.

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck	4.30@5.00	5.05@5.75
Rice	3.75@3.95	4.50@4.75
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—These are critical times for the bituminous trade. The situation has grown more serious because of the record-breaking cold wave which settled over this section of the country for four days. There was not a pound of coal available for the spot buyer, and many large consumers with contracts were on the verge of closing down their plants. Some plants did suspend operations.

The contract-making period is drawing close and while no one appears ready to make predictions it is apparent that few operators intend to tie up any large part of their output at the present prices, unless it be with a large consumer whose business they desire to retain. However, the Fuel Administration authorities will supervise all contracts and see that none is made for more than one year.

The shipping situation has not improved, although it was stated in newspaper dispatches that there would be 500 cars available early this week for bunkering at one of the lower ports. Vessels leaving here are from 3 to 5 days late, because of the lack of supplies.

One method of solving the present difficulty in transporting coal from the docks is suggested by labor leaders, who advocate Government control of all tugs, etc., in this harbor.

A freer movement of coal is predicted by many since the Government has control of the railroads. One operator with two mines, one located on the Pennsylvania and the other on the New York Central Lines, received 23 cars out of 138 required during November and December at the mine on the Pennsylvania Lines, and 22 out of 46 required at the other mine on the New York Central for the same two months. The same operator shipped coal about the middle of December, which had not reached its destination on the last day of the year.

The demand for bituminous has been increased by the shortage of anthracite, many users of the latter being anxious now to obtain a supply of bituminous to mix with anthracite culm. Factories working on war contracts have limited supplies. Large consumers of anthracite, city departments among them, have made inquiries regarding bituminous coal, only to be told that the conditions were as bad as in the hard-coal market. Few of the big institutions, including hospitals, have more than a few days' supplies ahead.

Deliveries have been impeded greatly by the heavy ice in the rivers and Bay.

Some shippers contend that the purchaser of the cheaper grades has a better chance of getting his coal than the buyer of the better grades for the reason that if the Government needs coal it will confiscate the better coals first.

PHILADELPHIA

Anthracite trade expects relief through Governmental control of railroads. New retail gross margin causes protest. Individual shippers get top prices now. Intense cold interferes with shipments. New contract forms prepared. Bituminous supply below demand. Car supply unimproved. Some plants closed. Advance in prices still looked for.

Anthracite—The announcement of the Government control of the railroads was received with satisfaction by the anthracite trade. Particularly was this so when it was stated early in the week that the entire Philadelphia & Reading system was to be devoted solely to the carrying of freight, with the elimination of all passenger service, except to a few non-competitive points. This decision was made on account of the Reading being the most important of the anthracite carriers. It is believed that the new plan will remedy the car shortage and that there will be no recurrence of the near-famine which beset the city recently. It will now be possible to send the empties where they are most needed, regardless of the road to whom they belong.

The announcement by Chairman Lewis of the city fuel committee and approved by State Administrator Potter, that effective Jan. 1 the retailers were permitted to increase their gross margin of profit to $2.50 per ton has caused a storm of protest from press and public. After weeks of investigation the authorities decided the dealers were not receiving a fair return on their investments and authorized the advance without giving the press a detailed report of the facts on which their findings were based. They simply stated that the increased expenses of these abnormal times warranted the increase and refused to be drawn into any controversy over it.

It is not believed that the National Administration will interfere with the action of the state and city bodies. In addition to the complaint of the consumers much confusion was caused by the fact that there is not a flat retail price all around. This was thought to be one of the objects of the new ruling, and while that may have been the intention, the fact that the wholesale prices still vary has caused at least

20 different sets of retail prices to be in effect at the same time. This is brought about by there being separate prices for white ash, red ash and Lykens Valley coal as shipped by the companies, with the individuals allowed 75c. above company prices, and then all of these prices further affected to the extent of 20c. a ton on all coal sold on commission, with a still further variation on account of freight rates. In fact the individual shippers who are combatting Chairman Lewis' plan to do away with their 75c. differential, advance this as a reason that even with its elimination the retail prices will be far from uniform. However, under the $2.50 gross margin plan the dealers will now be enabled to go right up to Apr. 1 without changing their prices instead of a change every two weeks as under the former system.

Dealers who may be inclined to charge rates in excess of those fixed by the City Fuel Committee now realize that the committee is in earnest. This week a local retailer was arrested for selling coal at an exorbitant price and brought before the United States Commissioner, who held him in $1000 bail for trial.

There continues to be considerable uneasiness among the independents as to the agitation among the dealers, seconded by the Chairman of the City Fuel Committee, against the differential of 75c. allowed the smaller operators. There are some who express the belief that an adjustment is bound to come, but they hope the present rates will not be disturbed before spring, when an entirely new schedule is expected, especially since the President in his latest statement intimated that he would order a reduction on Apr. 1.

All the anthracite companies are preparing new contract forms in compliance with the recent ruling of Dr. Garfield that such contracts must contain a clause that the contract shall be subject to immediate cancellation at the request of the Fuel Administrator and the coal subject to requisition by the Government. It seems that each move of the Washington authorities brings the matter of Governmental control of the mines more imminent, and the direct intimation this week to this effect by the National Administrator is causing quite an undercurrent of interest throughout the trade.

There is no abatement in the demand for any of the sizes and egg, which in normal times was never much in demand, is now as acceptable as pea, for which the demand is all out of proportion to the other sizes. The steam coals are also particularly active, although operators refrain from charging extreme prices which they no doubt could obtain. Buckwheat, on which size all the companies are far oversold and for which they have ceased taking new business, is being held at $4.15 by the individuals, although some of it is allowed to go through brokers for an additional 20c. The same can be said of rice based on a $3.35 price. Barley is now strong at $2.35, while culm at $1.50 has gained strength. The feature of this latter material is that so anxious are consumers for fuel that trial orders of single car lots are growing frequent, although repeat orders do not average high. Nevertheless there is a growing number of plants which are steadily using it, especially where the equipment is suitable and the element of objection on the part of firemen can be overcome. It is also reported that one of the railroads has designed a type of fire-box on its locomotives whereby a 35 per cent. fuel saving is effected by mixing two parts of crushed bituminous with one of anthracite silt.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for Tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—Coal is still extremely short. All consumers frantically urge for greatly increased shipments, yet little improvement is noticeable. Recently the weather has been such as to facilitate rail movement, but such a condition cannot be relied upon at this time of year. However, the car supply at the mines does not improve, and the operation that receives as much as a 40 per cent. allotment is indeed fortunate, as most of them report from 10 to 25 per cent.

Many manufacturing plants continue to run on short supply, with shutdowns quite numerous. Among these is the large oil-cloth plant of which State Fuel Administrator Potter is president, which has been closed for an entire week on account of lack of fuel. Up to this time the fuel administration has given little attention to the bituminous situation, the entire time being taken up in placing the anthracite domestic trade on a stable basis. This having been about accomplished its energies will now be turned toward helping the bituminous situation.

About the only activity in the way of spot business continues to be in coal sold for blacksmithing purposes. There is a fair volume of this business being placed and many coals not heretofore regarded as particularly adapted for this purpose are finding their way into this trade. Prices range from $4.50 to $5.75 per net ton, with all orders taken subject to delay.

Some interest was created by the announcement of the National Fuel Administrator that he would supervise all new contracts for the coming year to the extent that he would insist on a clause being written into each one providing for the diversion of coal in transit if so deemed necessary by the fuel authorities. Most shippers are of the opinion that this ruling differs in effect little from the practice of ordering priority shipments; at least it will have the same result. There is little likelihood of any considerable contract business being closed for the new year unless some concession in the way of higher prices is allowed. Rumors of new prices continue to be rampant and there are those who are willing to profess a belief that the new price will be forthcoming any day now. The consensus of opinion as to the increase seems to be that the advance will be from 80 to 90c. per net ton.

BALTIMORE

Baltimore closed the old year and started the new with famine-like conditions for both hard and soft coal. Big industries work part time.

Bituminous—Priority movement having failed largely and been wiped out by Federal order, the consumers of soft coal here faced almost famine-like conditions for the close of the old year and the start of the new. Many of the large corporations, including the street railways and lighting companies, shipbuilding and general war-product works, had from 24- to 48-hour supplies of coal at times. Service was curtailed in numerous cases, and the Bethlehem Steel Co. had to shut down a part of its big plant and shipyard.

Other big shipyards were hurt by failure to get coal or coke, the latter having disappeared from the market, even when given priority shipment rights by the Government. Small consumers were being cared for after a fashion by the contract receipts, or by appeals through the fuel administrator here and his submission of cases to a jobbers' committee. By apportioning these urgent calls the jobbers managed to keep the smaller industries all working, but it was a narrow squeeze at times.

Anthracite—The receipts of hard coal here are still averaging about 20 to 25 cars, against a normal daily need in winter of about 60 cars. The need is really greater because of the shortage heretofore existing. Many homes are heated solely by gas and oil heaters. The poor have been cared for in many cases by bushel sales of soft coal by the city at cost. Numerous institutions and churches are without coal, and there have been consolidations of work in some cases to get fuel results. Throughout the city there were often lines of people at coal yards to get fuel, while some yards were forced to close because they had no more coal to sell. The zero weather over several days caused much suffering, and the death list from pneumonia mounted alarmingly.

Lake Markets

PITTSBURGH

Pittsburgh domestic supply improved. Steel industry still suffers. Improvement from Government railroad control expected to be gradual. No holiday Jan. 1.

The municipal government of Pittsburgh announces that it intends to enforce rigidly the decree for lightless nights, Sundays and Thursdays, all unnecessary illumination to be eliminated. There was a considerable number of offenders last Sunday night and they are to be dealt with as strenuously as possible. The local fuel administration reports a great improvement as to supplies for domestic use, conditions being now almost normal. Relief was afforded chiefly through the receipt of coal by river.

There is a little improvement as to supplies of coal in this general district for plants making munitions, and little production is now being lost on this account. At the steel mills, however, there is scarcely any improvement and at some important works operations are far below normal. The worst case is that of the Republic Iron and Steel Co., the Bessemer department at its Youngstown works having been down for three weeks, there being insufficient coal to operate the finishing departments. This reduces the company's finished steel output by one-half.

Car supplies at mines have been slightly better thus far this week. The holiday, Tuesday, was not observed, either in placing cars or in loading coal, and if the better conditions continue through the week this will be the best week in four for coal shipments.

The view of the coal trade as to Government control of the railroads is that there will probably be a great improvement in coal movement eventually, but that the improvement will be very gradual, for the reason that the railroads must await the formal removal of the legal barriers against pooling. The General Operating Committee was unable to accomplish nearly as much as was expected, because it could not reroute much freight and could not place locomotives on the divisions that needed additional motive power.

Talk of coal shortage has reached such a point that it has gotten on the nerves of the majority of coal operators, who are taking pains now to tell everybody that there is no shortage of coal as coal; it is a shortage of motive power, whereby the coal is at mine instead of where it is wanted. This statement is said to represent precisely the verdict of the meeting of the national association of coal producers held in Pittsburgh last week.

There is scarcely any free coal in the market, but keen buyers are able to pick up odd lots now and then. The market remains quotable as follows: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. additional permitted to be charged when sales are made by brokers.

BUFFALO

Anthracite scarcer. Distribution better. No danger of a famine here this winter. Bituminous threatens to give out. Many plants with small supply. A survey may be ordered.

Bituminous—Every week, indeed every day, the report is that the supply of coal runs shorter. But for the fact that this has been the case for several months one would think there was no coal of account in the country. The fact is that the demand is far more than it ever was before and the amount of all sorts of manufactured goods being produced is immense. A rail trip in any direction will show this to be true. Coal is moving, but not as fast as certain other freight seems to be.

A survey of the bituminous supply of this district will have to be made at once or there may be general disaster from want of fuel. So many people use coal and light carelessly that they become fairly unaware of it and it will take some sort of jolt to stop the practice. An effort is to be made also to obtain Government permission to pay wagon or "country-bank" mines more than 75 cents a ton extra, as it is held that they cannot operate on that differential without a loss.

Most bituminous shippers adhere to Government prices, though it is claimed that all do not. The prices are as follows, per net ton, f.o.b. Buffalo:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.70	4.20
Allegheny Valley	3.60	4.10

Anthracite—The shippers are not sending much coal this way just now and the severe weather is keeping up the demand. Natural gas runs low and many coal furnaces are not doing much better. December alone has given us as much winter as is sometimes experienced during the whole season and there is time for two or three months more of the same conditions. Anthracite users are becoming alarmed. Canadian retailers throng the Buffalo shipping offices, some coming with the announcement that they intend to stay till they get a supply.

At the same time the shippers feel that they have covered the western anthracite-consuming field pretty well and have no fear of a famine, even if the winter goes on as it has begun. If there is no coal in retailers' yards it is because it has been taken by consumers. The fuel administrator has taken care of all complaints, which do not now come in in as great numbers as they do through the poor office in ordinary winters. Work is so plenty that no one need be idle.

TORONTO

Anthracite in active demand. Coal coming forward freely, but deliveries retarded by labor shortage. Prospective increase in prices.

Cold weather has increased the demand for anthracite for domestic purposes, and dealers are kept busy, deliveries being generally restricted to lots sufficient only for immediate needs. Coal is now coming forward more freely from the mines and transportation conditions are now regarded as fairly satisfactory. The principal difficulty in filling orders is caused by labor shortage, which is still acutely felt in all lines of industry. Prices are firm and for the present unchanged, though an advance of 15 per cent. per ton is anticipated shortly in view of the increase in freight rates.

Quotations for best grades per short ton are as follows: Retail anthracite, egg, stove, nut and grate, $9.85; pea, $8.85; bituminous steam, $9; slack, $8 to $8.50; domestic lump, $10; cannel, $11; wholesale f.o.b. cars at destination, three-quarter lump, $7 to $7.50; slack, $6.85 to $7.

DETROIT

Steam coal situation is reported temporarily relieved. Domestic supply is short. More than 2600 homes on police list.

Bituminous — Some improvement is reported in volume of incoming shipments of steam coal. Action by President Wilson in placing operation of the railroads under Government control is counted on to remove congestion existing on lines of coal carriers in Ohio and increase the supply of fuel for Detroit. Temporary provision has been made for requirements of the Detroit City Gas Co. and the Detroit Edison Co., both of which were getting low. Henry Ford & Son, tractor manufacturers in Dearborn, a suburb of Detroit, have called on the fuel administration for aid, the company having turned over its fuel supply for relief of some 200 families in the village, who were without coal.

Demand for steam coal continues pressing. One large industrial plant engaged in manufacture of munitions of war was closed a week, because coal was not to be had. Numerous other factories are working on day-to-day supply with the possibility of being obliged to close, ever before them.

Another period of extremely cold weather, with near zero temperature, is causing suffering in homes unsupplied with coal and an increasing consumption of fuel in others.

Anthracite—After more than a week's delay, the work of unloading the cargo of 9000 tons of anthracite from the Lake steamer "B. F. Berry" has been begun by a syndicate of coal men, who with the approval of the state coal administration, have purchased the cargo. The work proceeds slowly and the coal apparently is not reducing the number of orders received by the police department, which, on Dec. 29, exceeded 2600. A small amount of anthracite is coming to Detroit by rail. Efforts of citizens to obtain coal are disappointingly unsuccessful in most cases. Many of the dealers decline to supply those who are not regular customers. This works a severe hardship on numerous families that have come to Detroit during the year.

COLUMBUS

Another cold spell has once more tightened the coal trade in central Ohio. Demand from domestic users is as strong as ever. Fuel committee says the situation is well in hand.

With another cold spell covering Ohio, with temperatures hovering around the zero mark, the coal situation again becomes strenuous. Domestic users are clamoring for supplies and dealers are hard put to it to get supplies and make deliveries. Steam users are also short of fuel and the same is true of all public utilities and institutions. It is believed that the situation in the Buckeye State is as bad if not worse than during the blizzard of several weeks ago. Steps are being taken by the Ohio Fuel Administration through the county committees to relieve the situation.

Under the direction of the Fuel Administration dealers are restricting deliveries to two tons at the most. Because of a shortage of wagons and trucks, many of the purchasers are hauling their own supply of fuel. Consumers are not insisting on any special variety of coal, but are content with any kind or grade. Among apartment houses and office buildings the supply for current use apepars to be adequate. Retail prices are maintained at the levels fixed by the county committee. Retail stocks are not large, but arrivals of cargoes are reported from day to day. The situation outside of Columbus and more especially in the Miami Valley is much worse than in Columbus.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2 70	$3 05	$2 70
Mine run	2 45	2 70	2 45
Screenings	2 20	2 45	2 20

CINCINNATI

Severe weather again prevails, accentuating continued scarcity of coal, due to traffic conditions. The situation is serious.

Another period of severe weather, beginning on Friday, with more snow, has again emphasized the fact that the coal situation is far from settled, and that, on the contrary, the limited production due to the inability of the railroads to furnish cars and move them when loaded has resulted in a severe shortage of fuel of all sorts.

Domestic consumers, who are receiving first attention on account of the suffering that results from a lack of coal for heating, are getting small quantities from dealers, but there is literally not enough coal to go around, even when it is doled out in half-ton lots, as is being done. Many industrial concerns, public utilities, electric railroads, etc., are also facing the necessity of shutting down, and some have already closed on account of a lack of fuel necessary to keep going.

Cincinnati street-car service was interrupted, although only for brief periods, on several occasions recently, on this account, and, since the temporary supply of coal furnished from cars on tracks consigned to Lake ports, released through the cancellation of the so-called priority order, has been exhausted and no similar supply is now available, the present cold weather bids fair to cause more suffering than that which occurred just before Christmas. The situation is calling for anxious thought on the part of the trade, as well as of local and Federal authorities, as no means of relief for the near future is in sight.

LOUISVILLE

Kentucky coal trade receives hopefully news that Government will direct railroads. Priority regulations control industrial coal with little left for non-preferred industries.

The Kentucky coal trade received the news that the United States Government was to take over the railroads hopefully. Things have been so bad where car supply and embargoes have been concerned that the coal operators feel that any change would be an improvement. More cold weather has exhausted practically all of the retail stocks, while the cold has seen another failure of the natural gas supply in Louisville and central Kentucky towns.

Most retailers are a full week behind on deliveries. Inquiries of operators and coal selling organizations made by industrial consumers are numerous. In spite of the fact that there has been a fair supply of cars during the week a large proportion of the operators are not quoting on such inquiries. There is much criticism over the manner of application of the priority rules. One result is to concentrate shipments on one point, with the result that coal is accumulated there in larger quantities than are required and that there is further traffic-delaying congestion.

BIRMINGHAM

Short production last week seriously affects coal supply. Another cold spell causes retail yards to be besieged by householders. Most yards without stocks and but little coal in transit. Steam users clamoring for shipments more vigorously than ever.

Mine workers failed to respond to the earnest requests from the fuel administration and from mine owners to work steadily through the holidays and the production for the past week fell off from 33⅓ to 50 per cent. as a result. This loss in tonnage was seriously felt at this time when coal is badly needed, and distributors were besieged with personal appeals, telegrams and letters urging the shipment of both steam and domestic coal.

Local sales agents and brokers received wires from the fuel administrators of several states asking that coal be shipped to certain points in their jurisdiction and priority orders were also received from the national officials. Many of these requests could not be complied with, as explained by coal men, for the simple reason that they had no coal to meet such demands. Appeals came from many industrial plants, both through personal calls and by wire, stating that they were working on government contracts and were facing loss of time unless relief could be furnished in the shape of more fuel.

Another cold spell the last of the week sent the thermometer down to about 8 deg. above zero and resulted in the cleaning up of what little coal was in local yards. Movement of coal from the mines is slow and cars sometimes stay in local railroad terminals for three and four days before delivery is made to consignees. State fuel administrator S. P. Kennedy has brought to the attention of the national fuel administrator the seriousness of the domestic situation and asked for authority to direct shipments to local yards and other points in the state where the supply is practically exhausted and dealers are unable to secure any coal to supply the suffering public.

Coal operators have worked out a plan for the distribution of coal from each field, which will be submitted to the national administrator and urged for adoption. Briefly, the new method of handling the coal supply calls for the appointment of a distribution committee in each field, which will handle the coal mined in that section. Each coal-producing section will have a member of its distribution committee resident in Washington who will receive from the national fuel director priority orders for coal to be shipped from his respective section and he in turn will forward such orders to his home committee for placing at such mines as can care for the business without interference with the movement of coal being supplied to industrial plants, public utilities and other interests essential to the public and national welfare.

It is claimed that this mode of procedure will secure an equitable and wise distribution of coal, and at the same time avoid the confusion which is now being caused by conflicting priority orders being received from national and state administrators, some of which are cancelled and superseded by from two to three orders before the coal can be billed out to the original consignees.

Coke

CONNELLSVILLE

Car supplies improving slightly. Much blast furnace idleness. Poor quality of coke and explanation thereof. Contracts expiring and coming into force.

Car supplies Monday and Tuesday of this week were 50 per cent. and 30 per cent. respectively, with hopes that the week as a whole will make a better showing than any of the preceding three. Receipts of coke at blast furnaces have perhaps improved a trifle but there is no general improvement distinctly observable, and the best estimate that can be secured is that merchant blast furnace operations average 80 per cent. of capacity while the steel works blast furnaces are averaging 70 to 75 per cent. Close estimates, however, are extremely difficult.

There has been much complaint by blast furnaces of poor coke, consumption per ton of pig iron being claimed to run up as high as 2900 lb., when the standard for the ores customarily used is about 2200 lb. when making basic iron and 2400 lb. when making foundry. If this condition is common it would explain why the reported operation of blast furnaces is lower than would be indicated by the reported shipments of coke, particularly as banking consumes coke without producing iron.

As to poor coke, the operators lay the blame on the railroads, observing that the roads allot cars in proportion to the number of ovens operating. If an operator blows out ovens when he receives less than his requirement in cars, his requirement is thereby cut down, so that the turn-about operations would eventually result in no cars being furnished and no ovens being operated. The recourse is to keep ovens in blast and hold the charge, the quality of which is reduced after 72 hours.

A number of furnace coke contracts expired Dec. 31, these being chiefly agreements that were made for 1917 or contracts that were made first for the half year and then extended for the balance of the year. On the other hand many of the contracts made just before the set price was announced Sept. 24 were only for the period, a year or a half year, beginning Jan. 1. Both operators and furnacemen have been secretive in the past few months as to contracts entered into, but the best opinion obtainable in the trade is that the volume of contract business expiring Dec. 31 is a trifle greater than the volume of contract business coming into operation Jan. 1. As long as production is restricted, however, there is no prospect of much coke becoming available in the spot market. The market remains quotable at $6 for furnace, $7 for 72-hr. selected foundry and $7.30 for crushed, over 1-in., per ton at ovens.

Buffalo—The situation is unchanged, all coke consumers managing to get a supply out of their contracts. As it is supposed not to be possible to renew these contracts the prospect is of at least some of them being out of such coke at the beginning of the year, though most such contracts go on to April. So far as reported no coke has been sold here at the Government prices of $7 for foundry and $6 for furnace at the ovens, yet the complaint of shortage is not heard as is the case with anthracite and bituminous coal.

Middle Western

GENERAL REVIEW

Cold weather continues throughout the Mid-West. Available supply of coal inadequate to meet demands.

During the past week the production of coal has been decreased almost 50% on account of the holiday vacation of the miners and an insufficient car supply, coupled with the cold weather, that has prevailed throughout the Mid-West section. The low temperature that has prevailed almost the entire month of December, has retarded the movement of coal after it was loaded. It has thus increased the demands made on the dealers who in turn naturally look to the operators and jobbers for assistance in tracing and getting to destination delayed shipments. The shortage of hard coal is still noticeable in all sections of the country and in order to relieve this situation it has been necessary for the soft coal producers to make this shortage good. This has been almost an impossibility considering the limited car supply.

The operators everywhere are doubling their efforts to increase production, and hope that shortly they will be able to realize some beneficial results from their energies. According to the statement of Missouri operators the production in that state has been increased, and there is at this time an ample supply on hand at most dealers' yards to care for the immediate needs of their trade. Work in Indiana it is claimed has been fairly good during the past several days, since the Christmas holiday allowed the railroad companies to accumulate sufficient empty coal car equipment to tide the mines over for the remainder of the week. The action of the Government in procuring additional motive power from Western roads, and putting it at work in Indiana has had the effect of increasing the efficiency of some of the coal-carrying roads. At Bicknell the American Mining Co. is constructing one of the largest mines in the state. The new mine it is claimed, will be able to produce 5000 tons daily, and is electrically equipped. The power will be supplied by the Indiana Service Co., from Edwardsport, where a water power station has been built, which furnishes light and power for a wide area in that section of the state.

The situation in Illinois is, what might be considered serious. Railroads are badly crippled, and in need of both cars and motive power. To add to this difficulty, the coal miners have not reported for work during the past week with any regularity, in a manner ignoring the request of the Fuel Administrator that they continue at work throughout the holiday season. In some localities the miners responded nobly but in the majority of cases they did not and as a consequence the production even where cars were to be had slumped badly.

Retailers and steam plants have for months been on hand-to-mouth rations, and it is not necessary to call attention to the results noticeable by one familiar with conditions.

CHICAGO

Situation grows more serious. Many plants fear they will be compelled to shut down. Dealers' yards almost bare.

During the past week there has been no change of any consequence in the Chicago market, because of the little coal available and the congested, and near-paralized condition of the railroads.

In only a few instances has any Eastern coal arrived in this market with the exception of hard coal in limited quantity. This makes this market dependent on Illinois and Indiana and coal from these states has reached destination badly delayed. Every precautionary method possible is being applied to insure the coal reaching here, so that all distressing needs may be promptly and properly looked after. The Fuel Administrator for Illinois, together with his staff of assistants, has been working actively and harmoneously with both dealers and operators, in an attempt to make the half supply go around, with the hope that a better supply will be obtainable in the near future, and conditions thus relieved.

Plans are being perfected for the holding of a large and important meeting of the retail coal men in Chicago on Tuesday and Wednesday, Jan. 8 and 9, under the auspices of the National Retail Coal Merchants Association. Invitations have been sent out to a large number of dealers, and the hope is expressed that the attendance will be large and that dealers from all states in the union will be in attendance. Plans will be discussed for equitably distributing coal, also the best means of aiding the Government in handling this necessary commodity.

Placards announcing that the temperature in buildings should not be permitted to rise above 70 deg., were distributed in Chicago recently by representatives of the Building Managers Association. This is intended as a coal-saving measure, and applies to residences, apartments, office buildings and all hotels. The announcement is signed by John E. Williams and Raymond E. Durham of the fuel administration.

Quotations in the Chicago market are as below, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La-Salle, Bureau and Will
Steam lump	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Government administrator repudiates his latest anthracite schedule and puts dealers in an unpleasant condition. Conflict of authority in coal administration.

It is evident that a cog slipped recently in the Federal fuel administration machinery, and as a result Milwaukee dealers are busy these days in endeavoring to square matters with their customers by marking down their bills. The last report from this market chronicled an advance of 25c. per ton on all grades of anthracite coal, the same being of effect on Dec. 1. After selling for about ten days under the new order, an edict was received which restored the old schedule and directed dealers to rebate the difference to all purchasers.

This is a comparatively easy matter as far as books are concerned, but to make a refund to cash customers will take a great deal of time and labor, which in these busy days is not relished. The readjustment also involves accounts between wholesalers and retailers. The schedule as corrected is as follows: Nut, $9.45; stove, $9.35; egg, $9.10; buckwheat, $7.55.

A conflict of authority between coal administrators is threatening Wisconsin's coal supply. W. E. Overman, of Minneapolis, was recently appointed fuel administrator for Wisconsin, Minnesota and the Dakotas, and one of his first acts was to order anthracite coal shipped from Wisconsin to the other states named, notwithstanding the objections of W. N. Fitzgerald, the fuel administrator for Wisconsin. The latter appealed to Gov. E. L. Philipp, who at once wired a vigorous protest to Fuel Administrator Garfield, at Washington. Governor Philipp has requested Mr. Garfield to rescind Mr. Overman's orders and allow the present Wisconsin fuel administrator to decide how much coal can be spared. The outcome of the controversy is of great moment to coal consumers.

ST. LOUIS

Situation growing critical. No equipment and transportation facilities extremely bad. Mines working one or two days a week, no storage coal ahead, and everything on a day-to-day basis. No Eastern coals.

Seasonable weather with a temperature around the zero mark and the railroads almost out of commission is bringing St. Louis face to face with an actual coal famine. For the past week the railroads have failed signally, not only in the handling of loads but empties as well, and many mines have been idle for three days at a time on account of no equipment.

The coal trade rejoices at the fact that the Government has taken over the railroads. The only solution of the coal problem in the Middle West is in the betterment of transportation. With the railroads properly controlled and conducted, there would be no coal shortage in this region such as exists today.

It may be that there would have been an unusual demand, but it is a certainty that at least 20 per cent. more coal would be on the market if the roads were under a management that got good efficiency out of the equipment.

It is sincerely hoped that the new order of things that went into effect at noon on Dec. 28 will mean a change for the better. Conditions could scarcely be worse than they are now.

The steam plants in and around the city have not over 24 hours' coal supply ahead, and are depending upon the daily supplies brought in.

There is no coal ahead in the retail yards and they are depending upon arrivals from day to day. The consumer is practically on a hand-to-mouth basis, getting coal in small quantities, taking anything he can get. The city is conducting its municipal coal yards in the congested sections and selling coal for 16c. a bushel. This has helped out the poorer sections wonderfully and if it is continued throughout the winter will eliminate a great deal of suffering.

Cars are unloaded promptly by all consignees in the city, although help is scarce.

In the Carterville field there has been an unusual supply of cars, but for railroad coal principally. Very little coal going out of this field for commercial business, there is an actual shortage of equipment for such consumption. Movement is extremely slow, and the tonnage is not what it should be on account of many minor causes.

In the Standard district the railroads continue to get the greater portion of the coal. The service here has been unusually bad.

The prevailing market is as follows, per net ton f.o.b. mines:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80
3x6-in. egg	2.65@2.80	2.65@2.80	2.65@2.80
2x3-in. nut	2.65@2.80	2.65@2.80	2.65@2.80
No. 2 nut	2.65@2.80	.....	.....
No. 3 nut	2.65@2.80	.....	.....
No. 4 nut	2.65@2.80	.....	.....
No. 5 nut	2.15@2.30	.....	.....
2-in. sergs	2.15@2.30	2.15@2.30	2.15@2.30
2-in. lump	.....	.....	2.65@2.80
3-in. lump	.....	2.65@2.80	.....
Steam egg	2.65@2.80	2.65@2.80	2.65@2.80
Mine-run	2.40@2.55	2.40@2.55	2.40@2.55
Washed:			
No. 1	$2.65@2.80	$2.65@2.80	.....
No. 2	2.65@2.80	2.65@2.80	.....
No. 3	2.65@2.80	2.65@2.80	.....
No. 4	2.65@2.80	2.65@2.80	.....
No. 5	2.15@2.30	2.15@2.30	.....

Williamson and Franklin County rate is 87½c.; other fields, 72½c.

KANSAS CITY

Slight improvement in general conditions throughout the Southwest and it is believed that this improvement will continue and grow more pronounced.

Conditions in the Southwest, which have been acute for several weeks, improved slightly the last few days of December, even though the weather became colder. The lightless nights which saved 150 tons of coal per week in Kansas City brought partial relief in the power and light situation. Dealers, who have been taking care of retail business in the tenement districts in good shape recently, were beset by the "basket and sack" brigade at holiday time in numbers never before equalled. But, although the small order trade has been brisk at each cold spell of weather, there does not seem to be the scarcity of money that has attended other severe winters. No real suffering has been reported in the city. Coöperation of coal dealers is credited with the splendid handling of the retail situation here.

COAL AGE

Vol. 13 NEW YORK, JANUARY 12, 1918 No. 2

The Breakdown of the Railroads

By Josiah Keely

General Manager, Cabin Creek Consolidated Coal Co., Kayford, W. Va.

A large part of the press and the public continue their attacks on the coal industry, maintaining that the present shortage is due as much to inefficient operation of the mines as to the lack of transportation facilities. Many railroad officials have encouraged this belief. Mr. Keely's article here published is a plain and irrefutable statement of facts. What has been true in West Virginia is but a duplicate of conditions that have existed in most of the other important coal regions. Perhaps the railroads did the very best they could; however, too much censure has been directed where at least a little credit is due.—Editor.

ANYONE familiar with mine-haulage problems, can, by applying this knowledge, understand fairly well the difficulties of the railroads up to Nov. 1. In underground haulage, it is important to keep the proper balance in mine-car equipment, gathering locomotives or mules, and distance of partings from the faces. This is worked out by counting the number of cars, deciding on the size of the trip for the haulage locomotives, and making due allowance for cars in transit, cars in the working places, and cars switched out for repairs, or filled with material and slate for unloading. If you have just the right number of mine cars, the making of an additional parting may disarrange the whole scheme and hinder the haulage all over the mine. But new motor extensions are always necessary, so equipment is added from time to time to take care of an increased number of partings.

You have two mines with the same number of men and the same number of cars, but if one has a greater number of partings than the other, the larger tonnage is apt to come from the mine of the fewer gathering points.

If the main partings are pushed up too near the faces, the mules or gathering motors are waiting on the haulage locomotives, or, if the partings are allowed to remain behind, while the faces advance over a thousand feet, the mules are overworked and the haulage motor wastes time waiting at the parting on the gathering of coal from the faces. If car equipment is not increased to take care of the new partings the size of the trip is cut down, and locomotives are wearing their tires off rushing around with small trips, or else men are waiting on cars.

The balance is changing all the time, the size of the trip often depends on the number of loaders on a parting, or it may occur that the machine men need cars faster than pick men. It is the resourcefulness of the mine foreman that is called upon to meet these varying situations, but it is up to the superintendent or the manager to meet the call for equipment.

Let Us Apply These Principles

in a general way to railroading. Every time a siding is put in for a new mine, it is analogous to putting an extra parting inside a mine, a new distribution of railroad cars is necessary, and, as there has always been a car shortage when coal business has been brisk, every other mine operating along the same line contributes from its own car supply toward making up the allotment for the new mine.

One has only to look over the new mines of the past year to see that hundreds of these new railroad sidings have been put in with very little new railroad equipment in the way of rolling stock to take care of them. So, although the total tonnage hauled has not been far behind previous years, it has been gathered from more mines at the requirement of more tonnage miles, and all mines have had poorer service.

This cutting down of the working days and the lowering of earnings of the miners gave plausibility to their claims of inadequate wages; while engines were running from mine to mine with small trains of cars and making overtime, forming a basis for the demands of railroad employees.

A very good illustration of the railroad situation attracted attention over a year ago when Cabin Creek, Paint Creek and Coal River in West Virginia, were wiped out by a cloudburst, immediately losing a combined tonnage of a quarter of a million per month. The railroad lost hardly a ton of its two million per month, which simply meant that it had supplied the available cars to other mines which had not been receiving an adequate supply.

Yet we are told that the railroads "organized" immediately after the war declaration to take care of the increased tonnage demands. Here is the way one railroad "organized." In January of 1917, they were supplying the mines with about ten allotments per month and taking on newly developed mines every day. That is, from railroad reports, they were giving the mines about a ten-days' run per month. They cut the allotment all around twenty per cent. and, with the reduced allotment,

THE BREAKDOWN OF THE RAILROADS—*Continued*

were able to show more working days. Still they were giving the mines but half time, and, to increase their showing in this respect, they made another cut in allotment, so that in October, the fifteen allotments furnished gave exactly the same number of railroad cars as was given in January, but a showing of fifteen days run instead of ten. It is true that some of the mines were allotted so low that an operation listed as a 250-ton mine was frequently able to load 350 tons, but "organization" showed that the railroads were increasing month by month in ability to supply the mines.

In the Meantime

with the Spring of 1917, wages began to advance around the mines, and although the Railroad Brotherhoods "got theirs," the railroad section men, responsible for keeping up the track sections, were not advanced in proportion. In fact, the wage of the section-hands was left at about half the minimum wage of the miner, which resulted in a wholesale desertion of these men to the ranks of the miners, making the mines more able to load coal, while the railroad tracks were allowed to get in such bad shape that frequently mines were held up by wrecks and slides, to say nothing of sidings being so poorly kept up that derailments at the mines were of daily occurrence.

Stretches of track five or six miles in length had scarcely a splice bar with its full quota of bolts, and there were so many rotten ties that "spread track" furnished its quota of derailments. So thorough was the disorganization that not infrequently an excessive number of empty cars were placed at one mine while a shortage existed at another right in sight of it. Train loads of empties were reported on the way and miners were ordered to work only to find that cars would not arrive till noon. Material necessary for operating mines was allowed to stand around, or go astray. The month's feed for mules at one group of twenty mines was twenty days moving thirty miles, while feed was being hauled ten miles in wagons to keep the mines going.

But in spite of the general disorganization and the camouflaging of allotments, the mines did manage to keep going until Nov. 1. Then something began to happen, and by the middle of the month it had happened. The advance in miners' wages had gone into effect, the increase in the price of coal was allowed, and all operations stopped. At first there was suspicion and distrust. It was approaching the time for the Christmas pay to be earned. Rumors were out that the operators were stalling on account of the wage increase. Knots of idle miners could be seen everywhere discussing the sudden stoppage and searching for a satisfying explanation.

About December 1

the train crews began talking, telling the miners that there would be "nothing doing" before the first of the year. Telephones got busy and operators were assured that there was only a temporary "congestion" and that the train crews would be reprimanded for exciting the miners. Nevertheless, miners left in crowds seeking other employment. The Virginian Power Plant, furnishing power to scores of mines, had trouble getting water supply and was shut down two days. The fact was duly discussed by the newspapers, and much solicitude was shown that the mines should be shut down on this account. Apparently the press had not noticed that the mines had been shut down for a week for lack of cars, and the railroad apparently did not know that there was no power, for they suddenly found that they could supply some cars on these days, an ability which they had failed to exhibit before or since. Anyway, the remarkable thing is that no one except the operators seemed to feel that anything exceptional was wrong with the railroads.

Following two weeks of almost absolute idleness at the mines, the monotony was relieved by the receipt of appeals from the Fuel Administrator and the Governor of West Virginia for miners to show their patriotism by working through the holidays. Still only a few articles appeared in the press to show that the general public was aware of the situation. A very moderate letter of Mr. Wheelwright of the Consolidation Coal Co. came out showing quite plainly what was wrong at the mines when no cars were available, and there were rumors of pooling, and the appointments of State Fuel Administrators, but still, aside from some criticism of priority orders, nothing adequate was offered for the sudden stoppage of business.

And So the Old Year Goes Out and the New Comes In

with the sudden loss in December of a million tons of coal. The prediction of a few freight crews came to pass almost to a letter, yet the head officials and the general public apparently do not know what was the trouble.

Appeals were made to all miners to work through the holidays, and now that the holidays are over to save their money! Is it possible that coal operators have been so discredited that their complaints cease to be taken seriously? It also appears that the press and the public are going the even tenor of their ways, continuing to murmur the oft repeated formulas, "Keep Working," "Keep Saving," "Your Country Needs Coal," while the railroads are completely broken down and thousands of miners, having lost their Christmas pay, are still hanging on at the mines hoping to get a chance to load coal.

Can It Be Possible

that it is necessary to so discredit the miner in order that the railroads may not lose the confidence of the public? Head lines would not be too late even yet, but a month of blame has already been borne unjustly by operators and miners. There has never been any serious doubt on the part of those who know, that the coal mines of the country could put out all the coal needed if given a fair chance.

IDEAS AND SUGGESTIONS

Precautions To Be Observed in Coal Mines During Cold Weather

BY FREDERICK B. HICKS
Kingston, Penn.

It is the duty of every official inside or outside the mine to call special attention to the precautions necessary at this season of the year to safeguard mine property against fire and to see that all fire-fighting apparatus is protected against freezing and breakage. The damage caused by frost sometimes affects the entire fire protection system sufficiently to prevent its efficient use.

All hydrants and valves should be examined carefully every three hours by the chief of the mine's fire department, and they should receive this attention both day and night. The valves and hydrants should be oiled with a heavy mineral oil which will not corrode the brass. All hydrants on standpipes and all Y or branch hydrants should be opened after the pipes are emptied, to let out any entrapped water which may have leaked past the valves when the pipes were full, care being taken that the drip valves of the post hydrants are in good condition.

Rotary pumps should also be oiled, and if they are exposed to freezing weather should be reversed to empty them of water. Pipes exposed to the frost should be emptied too, care being taken that the water is let out from above the check valves. Those who are placed in charge of such apparatus should know when the gate and drip valves are in good order.

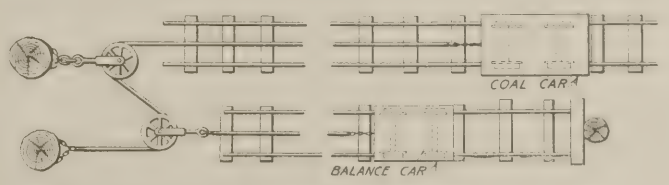
ADVICE ON CARE OF AUTOMATIC SPRINKLERS

Drip valves should be marked by an arrow showing how they should be turned to open. Hydrant houses should be arrayed for winter service, and lanterns and other appliances should be put into condition and kept hanging convenient for immediate use. If necessary, changes should be made to the doors of the hydrant houses, so that they cannot readily be obstructed by ice.

Automatic sprinklers that cannot be kept warm should have their petcocks opened after the main valve is closed, and the water slowly drawn off at the drip pipe, in order that the sprinklers should not be rendered liable to leakage by a sudden change of atmospheric pressure. This may happen if the water is drawn off rapidly. When it is found necessary to close any sprinkler valve, every member of the colliery fire department should be informed of the fact and also that the valves must be again opened in order to operate the sprinkler in time of fire.

Especial care should be bestowed upon the valves of an automatic sprinkler system. Frequently these valves are shut when they should be open. Valves which are to be kept open should be secured in such position by a leather strap (not a chain) passed around the pipe and one of the spokes of the handwheel of the valve, the ends of the strap being held together by rivets or a padlock. This strap should be sufficiently loose to enable the handwheel to be moved half a turn, in order that the valve may be turned fully open at any time. The valves should be kept a quarter to a half turn from being full, so as to render inspection possible without removing the strap.

On new sprinkler installations it is recommended that all valves be provided with an indicator showing whether they are open or shut. This is important. It is only a matter of chance that the numerous instances of close sprinkler valves have been revealed by the company fire inspectors and not by fires.



Thousands of dollars' worth of buildings and equipment could have been saved annually in the mines of this country if the practice set out in the foregoing paragraphs had been adopted as part of the plant routine.

Counterbalanced Room Haulage That Saves Considerable Man-Power

BY J. M. RODDY
Springfield, Illinois

A reference is made in a recent issue of *Coal Age* to the effect that miners in the anthracite region use light, bottomless boxes into which they shovel coal, permitting these boxes when full to slide down the room on sheet iron. When empty, the boxes are pulled back to the face of the chamber for reloading. It seems to me that this method entails the loss of considerable man-power that should be saved if possible.

I have had no experience in the anthracite region, but show in the accompanying sketch a system that I think would be favorable under the conditions there encountered and one that should give good results. Two cars are employed, one for a counterbalance, while the other is a coal car. The coal car should be constructed so as to discharge its contents to a waiting mine car when the lower end of the room is reached. The counterbalance will pull the empty coal car up the incline again, and so on continuously.

THIS HAULAGE SCHEME CONSERVES MAN-POWER

This system could be operated successfully on a slope of 1 to 4 or 4½. The rails should be laid on the coal-car line the full length of the room and the ties or sprag track sunk well, so as to keep it in place. The travel of the counterbalance need be only one-half or one-quarter that of the coal car, as shown in the sketch. The traveling speed of the coal car will of course be two or four times that of the counterbalance.

An Up-to-Date Coal-Mine Power Plant

By DEVER C. ASHMEAD
Tarrytown, N. Y.

SYNOPSIS—*A new central power plant just put into operation, taking the place of three old plants. Description of building and machinery, with details of construction and some kinks used. A simple, but good dam and reservoir insures an adequate water-supply. An unusual outside arrangement for a transformer station at one of the substations. Some interesting figures on power production.*

AT CLYMER, Indiana County, Pennsylvania, the Clearfield Bituminous Coal Corporation has recently completed and put into operation a modern power plant. The erection of this plant was started Apr. 1, 1916, and the installation was completed in October, 1917, since which time it has been furnishing power to the company's mines.

When projected the plant was designed to furnish power only to the Barr and Sample Run slope mines in the Clymer region and to the concern's West Branch mine in the Barnesboro region. However, the plant not only did away with the individual power plants installed at the three operations just mentioned, but in addition furnishes power to the Pennsylvania Public Service Corporation. The coal company is now making arrangements to connect its Clymer plant with its Rossiter plant, which is 18 miles away. At present the Clymer plant has a capacity of 2000 kw., but complete arrangements have been made for doubling the present capacity by the addition of a 2000-kw. turbo-generator and a sufficient amount of boiler-horsepower, together with the necessary auxiliary machinery.

In sinking the concrete foundations for the power house, which is a substantial yellow brick structure 121 ft. 6 in. long by 86 ft. wide and 38 ft. 8 in. high, and very attractive in design (see Fig. 1), it was found necessary in some instances to carry the excavations down as much as 23 ft. in order to obtain a solid footing.

The coal seam dips from the rear of the boiler house toward the front at about a pitch of 6 per cent. At the middle of the boiler house the basement floor came on the blossom of the coal. As this did not give sufficient bearing, it was found necessary to use an inverted arch constructed of reinforced concrete to give the necessary support. The reinforcing used was thoroughly cleaned old discarded strap rail $\frac{1}{2}$ x 2 inches. In the spring of 1918 the company intends to lay out the grounds surrounding the boiler plant as a park, such as it has at the Rossiter power house.

The interior of the building is painted white. The floors are of reinforced concrete. The sash is of steel with wire-glass lights. In Fig. 1 it will be noticed that the main approach is not finished, but it is the intention to build a simple and attractive approach in the spring.

The stairways are of steel and concrete, and are of an interesting and unusual construction, as is shown in Fig. 2. The two stringers are made of 10-in. 20-lb. channel-bar sections. A piece of angle bar 9 x $1\frac{3}{4}$ x $1\frac{3}{4}$ x $\frac{3}{16}$ in. is bolted to the flat side of the channel-bar and the angle turned up for the treads to rest on. The treads are made of two pieces of angle bar of the same cross-section and of sufficient length to reach both stringers. These angles are bolted with one side down on the crosspiece and the other side forming the face of the tread or the back of the tread as the case may be. Between these angle bars a piece of steel lath is fitted and concrete is poured in on top, filling the space between the angle bars and making the top of the tread concrete. This affords an absolutely fireproof stairway, there being nothing but steel and concrete used in

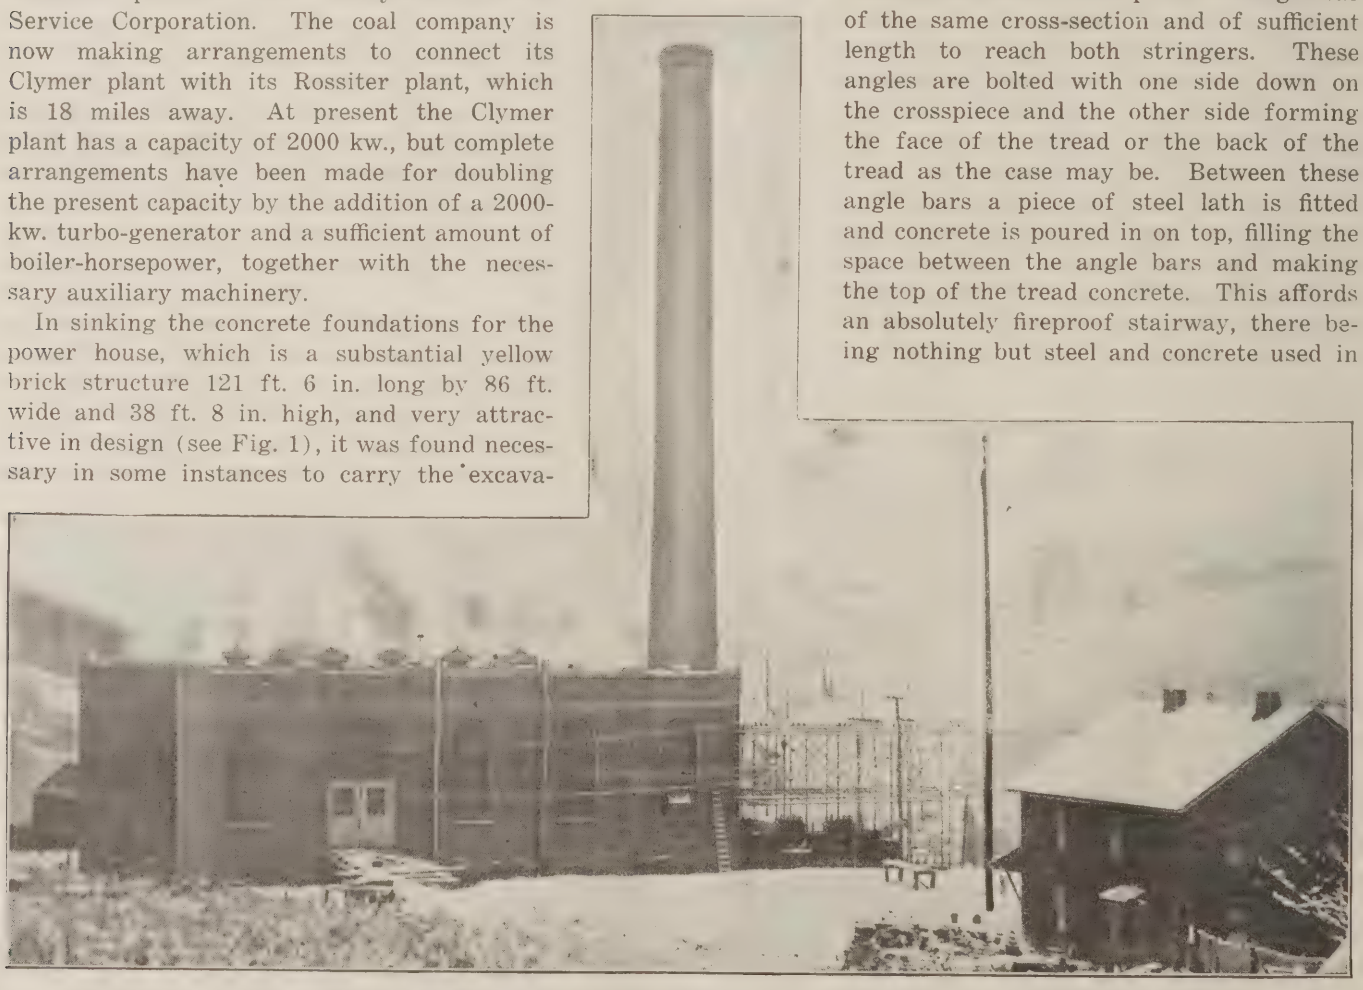


FIG. 1. VIEW OF CLYMER POWER PLANT, SHOWING OUTSIDE TRANSFORMER STATION

its construction. The roof trusses are of steel, and the roof itself is covered with Johns-Manville five-ply asphalt-and-asbestos roofing.

The boiler room of the Clymer power house has every modern convenience for the economical production of power. It is 86 ft. long by 78 ft. wide and contains

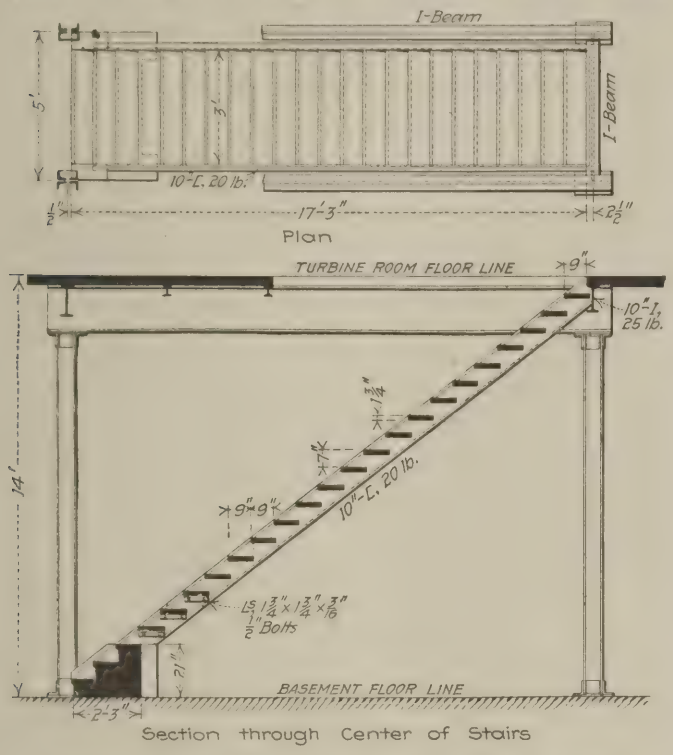

FIG. 2. STEEL STAIRS USED IN POWER HOUSE

four boilers, coal bunkers, feed-water heaters and room for four additional boilers. The draft apparatus, feed-water pumps and coal crushers have been installed in the basement, where provision has also been made for the handling of ashes.

Let us follow the coal from the time it comes into the power house until it leaves in the form of ash, and then follow the water until it is converted to steam. The mine car loaded with mine-run coal, is brought by an electric locomotive directly from the mines to a coal hopper, and the car is dumped over a Phillips crossover dump. The empty car then runs by gravity back to the empty track.

Details of the Coal-Handling Machinery

The coal in the hopper is then picked up by the apron feeder, Fig. 6, and carried 18 ft. to the two-roll crusher. From this crusher it is taken in the bucket elevator, which is 58 ft. long, to the top of the boiler house, and distributed by means of the scraper conveyor to the coal bunkers. As the bucket elevator takes the coal to a point halfway between the two coal bunkers, the scraper conveyor is made reversible so that it can supply both bunkers. The scraper conveyor is 56 ft. long.

The apron conveyor and the crusher are operated by a 15-hp. motor, the bucket elevator by a 7½-hp. motor and the scraper conveyor by a 5-hp. motor. Friction clutches are arranged on all three conveyors and the crusher, so that when it is necessary for men to work around the machinery they can shut down the operation of any piece, which cannot be started from the main floor unless the clutch is in, thereby protecting the workman. Ordinarily the operation of the conveyors is controlled by switches on the main floor of the boiler room, the switches starting or stopping the motors. Part of this coal-handling machinery is shown in Fig. 6.

The coal bunkers themselves are of considerable interest. They are made of steel, to the inside of which have been welded wire nails. To these nails steel lath has been attached, and then cement applied by means of a cement gun, until a thickness of 1½ in. was obtained. This makes a solid concrete lining for the bunkers. The outside of the bunkers is shown in Fig. 3. All the coal-handling apparatus was furnished by the Link-Belt Company.

By means of chutes the coal is delivered from the bunkers to Jones underfeed stokers (Fig. 4) which feed the coal to four 500-hp. Keeler water-tube boilers operated at 175-lb. pressure. With this type of stoker, it is necessary to take the ashes out of what is ordinarily the coal door. The ashes are raked out onto the main floor of the boiler room and dropped through an ash opening into steel cars in the ash pit. These cars are run to the outside and dumped. A double track has been provided, one for the present boiler equipment and one for the future installation.

Mechanical Draft Apparatus Is Used

The draft for the present set of boilers is supplied by a 150-ft. brick chimney 8 ft. 6 in. in diameter. A second chimney will be built as soon as the second battery of boilers is installed. The draft supplied by the chimney is augmented by a Jones mechanical draft apparatus.

The arrangement of the blower fan for this mechanical draft is rather interesting. Two vertical self-oiling

FIG. 3. COAL BUNKER; 75-TON CAPACITY

engines built by the Troy Engine Works have been provided for driving the fan, one engine at each end of the mainshaft. The arrangement is such that in the event of engine trouble the fan can be uncoupled from the engine driving it by unscrewing four nuts on a flange coupling and removing the bolts, shifting the fan ½ in. and coupling to the engine at the other end of the fanshaft. The whole change can be made in five minutes.

The feed water is supplied from a reservoir (to be described in Part II of this article) to two 1000-hp. Cochrane open feed-water heaters. From here it goes to a hotwell tank which contains a sufficient supply to run the boilers for 15 min. in case of an accident to the water line or the supply. This would give ample time to shut down the plant and draw the fires. An automatic valve

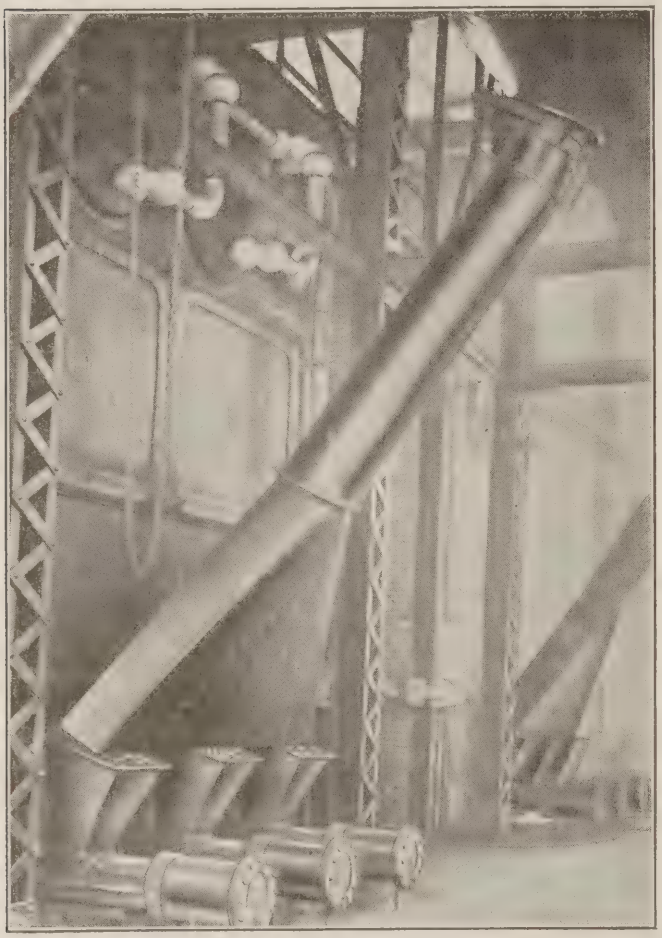

FIG. 4. JONES UNDERFEED STOKERS

is provided in the hotwell tank to keep it filled to the proper level.

From this hotwell tank the feed water is supplied to the boilers by two Alberger 3-in., three-stage, type S turbine-driven centrifugal pumps, which operate noncondensing. The operation of these pumps is regulated by a Foster feed-water regulator, which is so arranged that in case the fireman should neglect to give the pumps the proper attention, such as cutting off the feed water to the boilers and not stopping the pumps, the regulator will automatically shut down the pumps by closing a valve in the steam line, which is operated by the pressure of the water. This prevents damage to the pumps from too high a pressure.

The blower machinery, the feed-water pumps and the crushing machinery are located in the basement of the boiler house. The company is now building light concrete partitions to separate the crusher machinery and its attendant dust from the pumps and mechanical draft systems. At present the blower fan is sucking up the coal dust and blowing it to the boilers, but some of it leaks into the boiler room and some gets into the blower machinery and the pumps, causing unnecessary wear.

The system of piping is extremely interesting. The main steam headers, Fig. 6, are arranged in a ring. The five valves are placed so that in case of an accident to any part of the leader line that particular section can be cut out. As soon as the new battery of boilers is installed there will be a second connecting ring, further extending the plan of being able to cut out any part of the header system without shutting down.

Each boiler has two valves on its individual header, as shown in the figure, so that in case men are working on the inside of the boiler they will have a double protection against carelessness. The piping is extra heavy and flanged Vanstone joints are used.

The turbine room, which is 86 ft. long by 43 ft. 6 in. wide, contains two type ATB, 1000-kw. (125-kv.-a.), 80-power-factor, 3600-r.p.m., 2300-volt, 60-cycle, three-phase General Electric turbo-alternators with separate excitation and arranged to operate condensing. The turbo-generators, exciters and switchboard are installed on the main floor, the condensers, circulating and dry vacuum pumps being on the basement floor. A plan and cross-section of the turbine room is shown in Fig. 6, which is a diagrammatic view of the entire plant.

Excitation is had from a General Electric motor-driven exciter set consisting of one DLC-6-35-kw. 1200-r.p.m., 125-volt, compound-wound exciter direct connected to one 1-6-50-hp. 1200-r.p.m., 220-volt, 60-cycle, three-phase form K motor. This exciter is further augmented with one General Electric type CC-2-35-kw. 3600-r.p.m., 125-volt, direct-connected, turbine-driven exciter of the noncondensing type.

The General Electric type H-60-20-kv.-a., 2200/220-volt, 60-cycle, single-phase, oil-cooled transformers are used to step down the generated voltage for use with

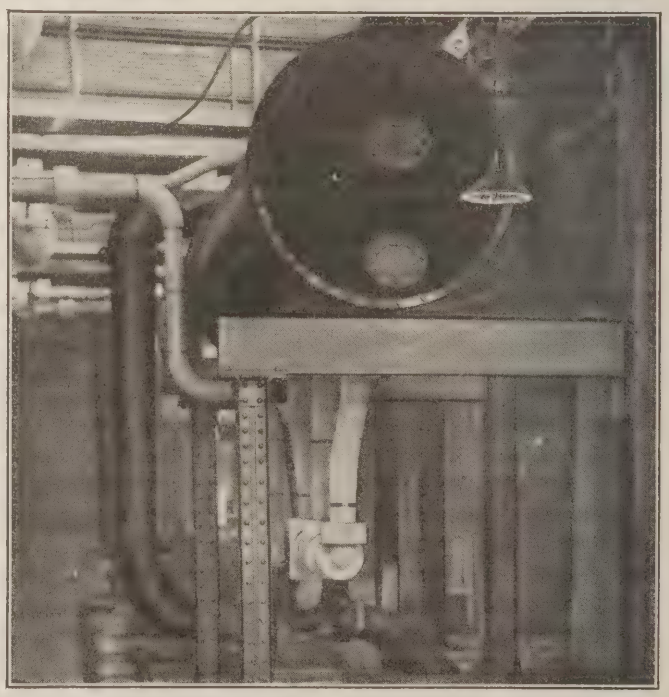

FIG. 5. SHOWING THE CONDENSER EQUIPMENT

the motor-driven exciter set and the motors used to drive the coal-handling apparatus.

The switchboard is constructed of a natural black slate and consists of one two-circuit exciter panel, one transformer and Tirrill regulator panel, two alternating-

current generator panels, two blank panels for future generators, one total load panel, three step-up transformer panels, and two blank panels for future feeder lines. Fig. 8 shows the interior of the generator room with the switchboard in the background. The switchboard is so arranged that all the oil switches are mounted on a pipe framework 6 ft. back of the panels and connected to switch handles by means of levers and bell cranks. A 15-ton Morris Brothers double-beam hand-operated traveling crane, with a chain hoist, has been installed in the turbine room.

One particularly interesting feature is the unusual arrangement of the air ducts for carrying cold air to the generators for their cooling. Fig. 7 shows the details of these air ducts. At the Rossiter power plant of this company a great deal of trouble was had with the generators due to the formation of ice on the outside by the condensation of the moisture in the air of the room, the generator being made too cool by the ice-cold air from out-of-doors, causing the condensed moisture to freeze. In other words, the generator acted as a suction fan and sucked in more air than it could heat.

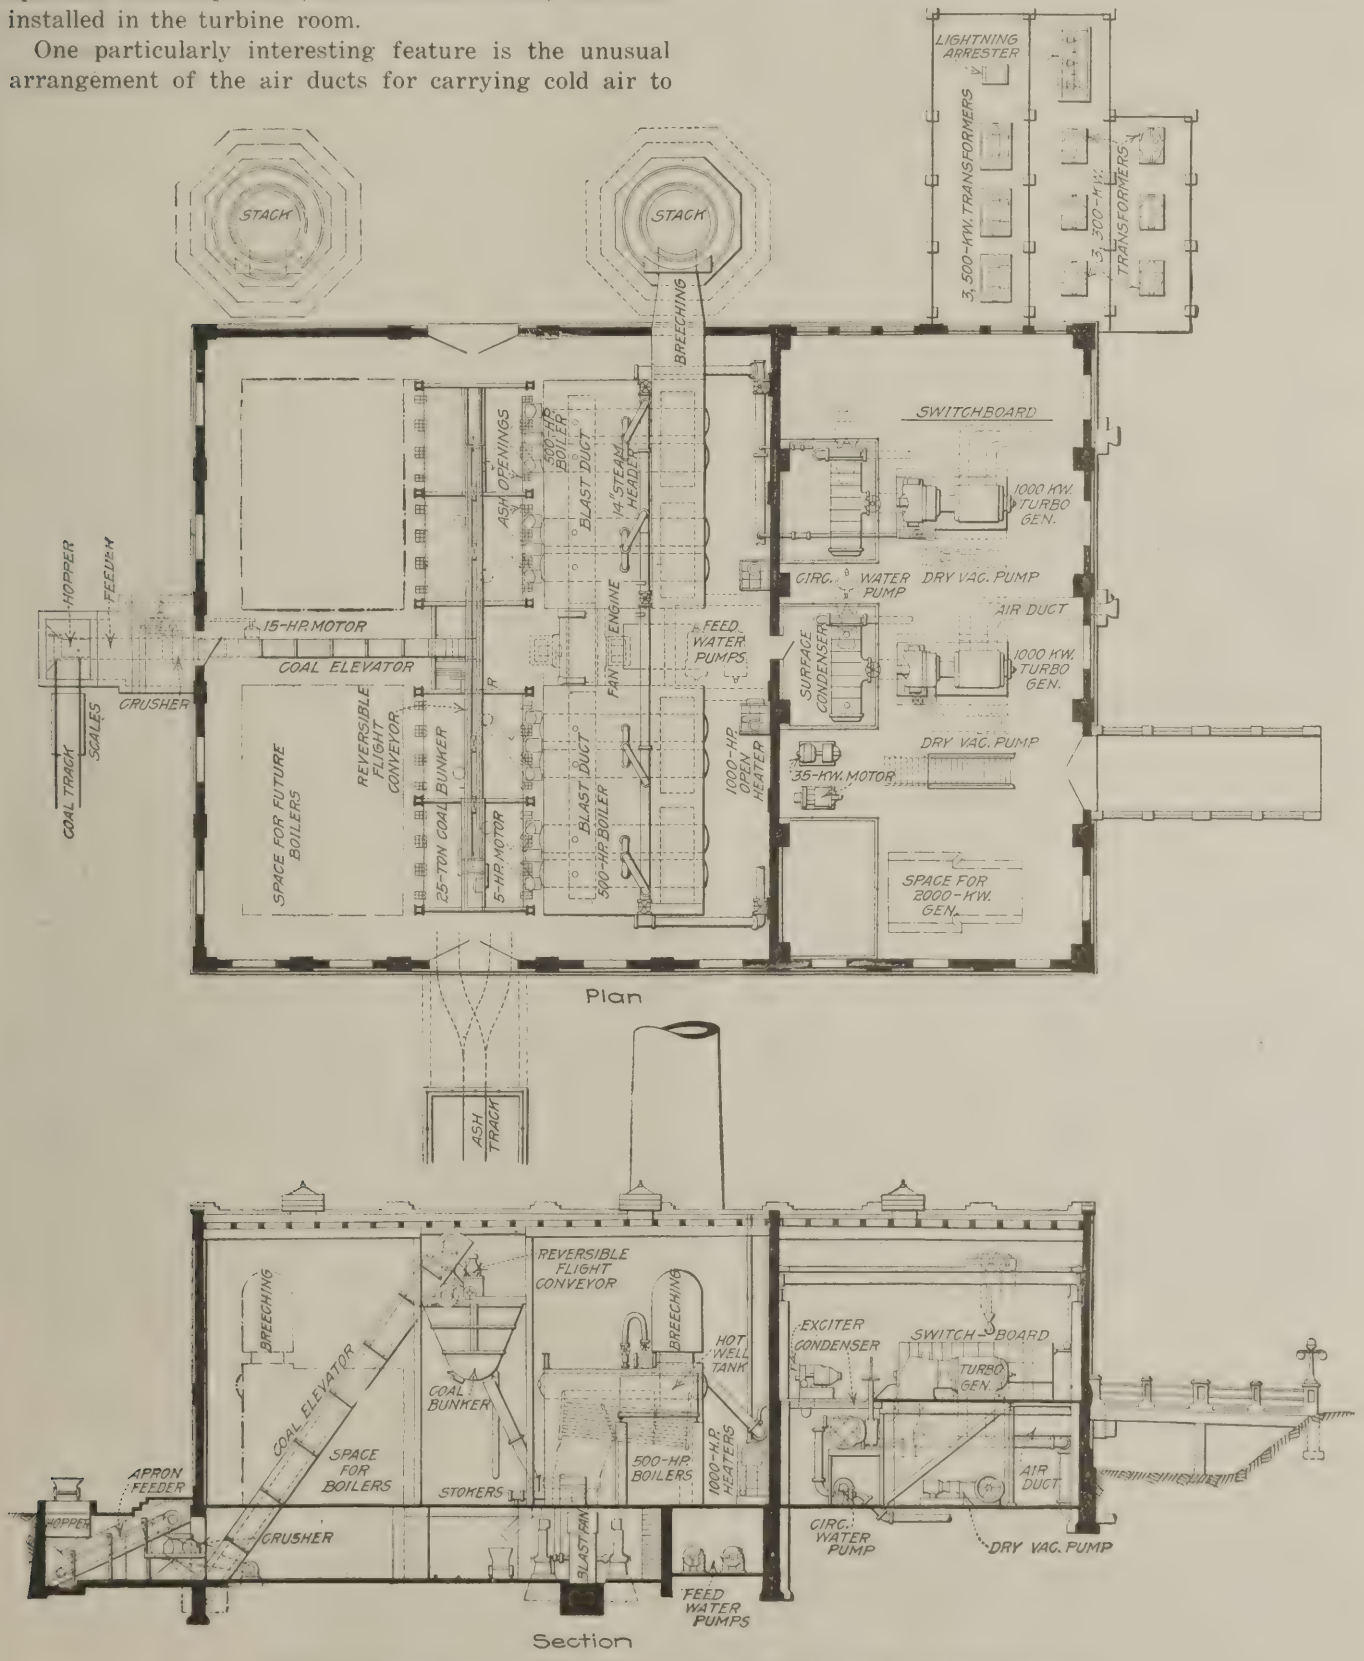

FIG. 6. PLAN AND CROSS-SECTION OF THE CLYMER POWER PLANT

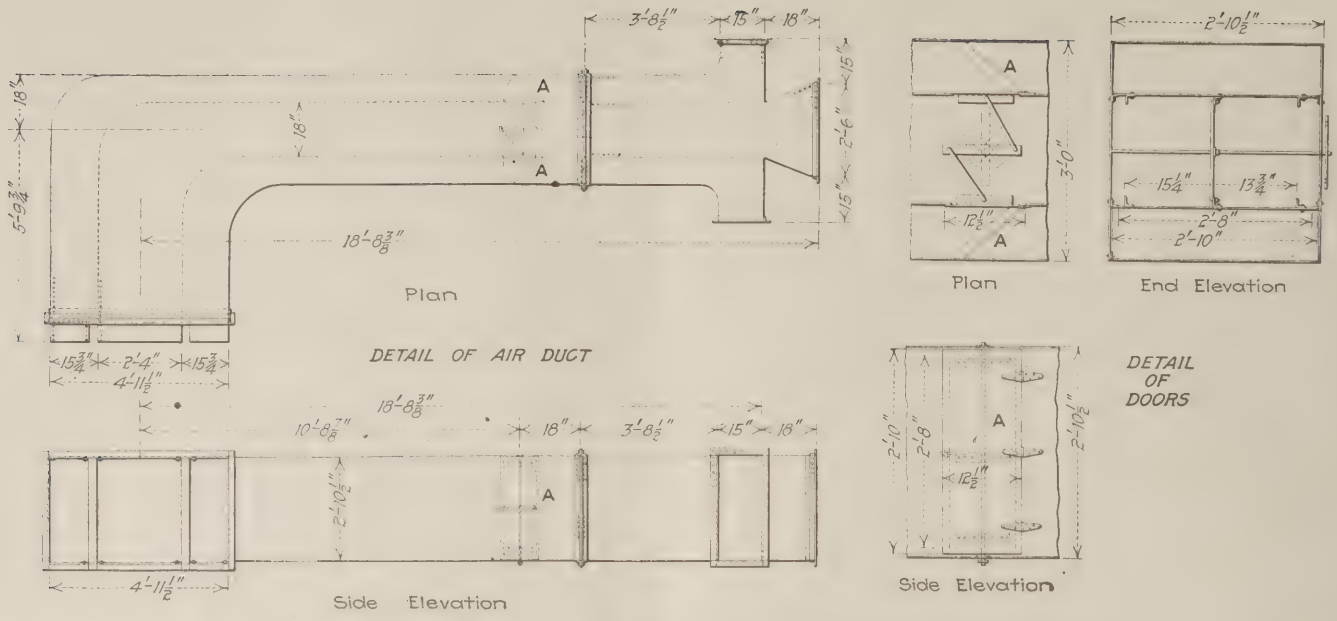

FIG. 7. DETAILS OF AIR DUCTS THAT COOL THE GENERATORS

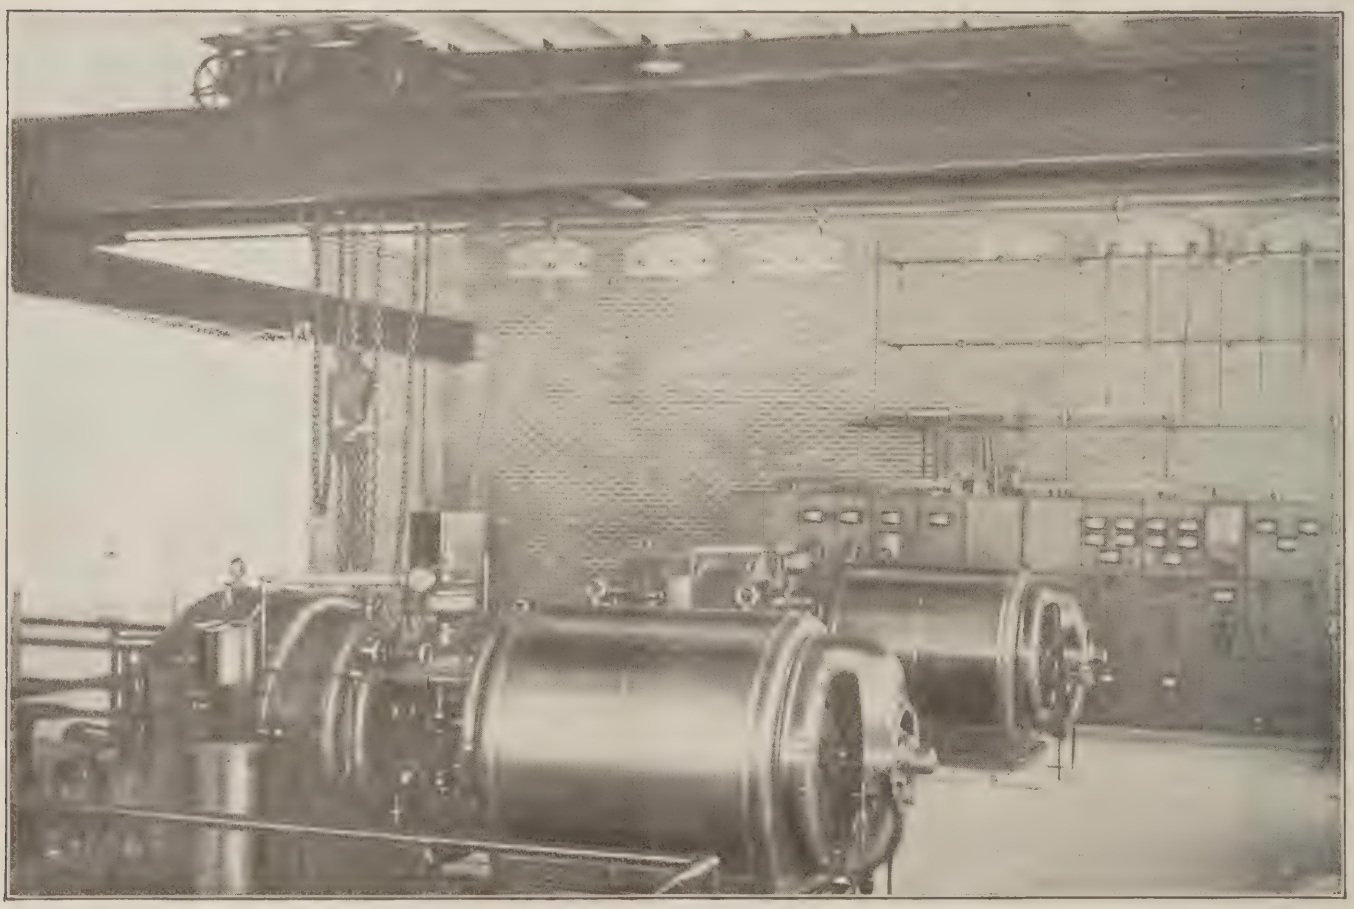

FIG. 8. PART OF GENERATOR ROOM, SHOWING GENERATORS AND SWITCHBOARD

In order to do away with this trouble, the door *A* was placed in each side of the intake air duct, as shown in Fig. 7. These doors are so arranged that the amount of air passing to the generator can be regulated by opening or closing them, thus maintaining an even temperature.

The condensing equipment consists of two Alberger "Spiro-Flo" surface condensers together with two 10-in. two-impeller turbo volute pumps direct connected to and driven by Alberger-Curtis noncondensing steam turbines with two 2-in. Alberger standard volute condensate pumps mounted on the end of the pumpshafts. There are also two 8x16 12-in. Alberger horizontal dry vacuum pumps. A vacuum of 27½ to 28 in. is obtained with these pumps. (See Fig. 5 for illustration of the condensers and the two-impeller turbo volute pumps and turbine, and also the volute condensate pumps.)

[The next installment of this article will describe the dam and reservoir of the Clymer plant.—Editor.]

(*To be concluded*)

Efficiency Engineering for Coal Mines*

By C. H. ELSOM
Charleston, West Virginia

SYNOPSIS — *The art of coal mining today involves several specialties. Only by employing specialists who are capable of securing the best results in their various lines will the overall efficiency of the entire mine be made a maximum. One of the most important specialties involved is here discussed.*

NO PROGRESSIVE man or organization of men is bound by past performances. Opinions must of necessity change with conditions, and old methods must be revised if advancement is to be attained. Progress and stagnation are of opposite polarities: antiquated methods must give way to new.

An astronomer fixes his telescope on a distant star, and as his observations progress the angle of the telescope must be constantly shifted, not because of any motion of the star, but because the earth moves. In like manner thinking men, men who do things, are quick to realize the changes going on about them. They know that precedents are precarious and that new ideas are essential to success.

Naturally this change is being reflected in the coal-mining industry, and higher efficiencies, both with respect to labor and equipment, as well as better ways of accomplishing the same results, are occupying no little thought and attention on the part of the coal operator.

Is Efficiency Engineering for Coal Mines Justified?

In arriving at a decision as to whether efficiency engineering for coal mines is justified, we must determine whether by means of it there results an actual saving in dollars and cents. The best definition ever given for an engineer is "one who can do for one dollar what any fool could do for two," and it is doubtful if there is any field of endeavor involving an equal amount of capital and doing the same volume of business as the coal industry where so many two-dollar men have been employed. It has been correctly stated that the average operator has a good working knowledge of civil and mining engineering, yet when he opens a new mine a mining engineer is the first man he employs. He admits that he knows little or nothing about electrical engineering, yet he will intrust this work to an untrained electrician and rely on incompetent or biased advice. For this reason, this paper is devoted chiefly to the discussion of the efficiencies that can be brought about by the electrical engineer.

The coal industry has developed rapidly, and many can no doubt recall the time when the only equipment needed to start a mine was a mine car, a mule, a pick and a shovel. This equipment was crude, and it was found necessary to electrify the mine in an effort to increase tonnage. Thus each operation soon had its individual power plant, with direct-current equipment. The next step was the isolated alternating-current plant, and then the central station with its high-tension distributing lines and the substations located so as to supply power near the point where it was to be used. The advantages of this arrangement were an unlimited source of power, improved voltage, continuity of service and a shifting of responsibility to the shoulders of others specially trained for this work.

On the other hand, it soon became apparent that it made a radical difference in the power bills whether a motor-generator set or a rotary converter was used as converting apparatus, whether the fans and pumps continued to be driven by direct-current motors or put on alternating-current service, whether the hoist motor was put on direct current or alternating current. In short, it was found that a whole new situation presented itself for solution, and the man who thought quickly and correctly, as well as acted promptly, was the one to effect the greater saving. There are many yet, however, who do not realize the importance of adopting new methods, and of getting out of the rut.

Costly Errors Are Frequent

To cite a familiar example, the confusion of ideas with reference to *power* and *voltage* is such that errors are frequent and cases are known where a second generator was installed when it was desired to improve the voltage at the end of a long transmission line. Had this additional expenditure been put into a substation at the end of a transmission line, the object in view would have been achieved. I know of a substation containing two large motor generators located at the drift mouth of a big mine. The present workings are two miles from the substation, and in the center of the workings the voltage is so low that the coal cutting and all mining operations are carried on with extreme difficulty; furthermore, 45 per cent. of the power purchased is lost in conversion and transmission. Simply relocating one of these motor generator sets so as to have one at each end of the haulage system would result in an improvement in voltage, an increased production and a decrease in maintenance and power bills, due to lessened losses and improved voltage. This change would cost several thousand dollars, but the saving effected thereby would be such as to equal the expense in a year and a half.

In the installation of trolley, feeders and bonding the most expensive method is to allow these same incorrect ideas to influence the plan of procedure. Other instances of inefficiencies may be cited, such as one mine where a short grade caused heavy peaks on the power house. A few hundred dollars would have eliminated this trouble by cutting down the grade, but the cause of trouble in the power house was attributed to lack of power, and something over four thousand dollars was spent in additional equipment, which further resulted in much greater operating expenses. Other somewhat similar cases of inefficiencies are numerous. Poorly designed power houses and substations, the wrong solution of converting apparatus, fans, tipple motors, locomotives, etc., are too numerous to mention.

*Paper read before the West Virginia Coal Mining Institute.

Similarly, the mining engineer and the practical coal-mining man has his special field to cover, in which efficiency engineering is equally as important. In other words, the efficiency engineer takes advantage of *all* facts that will accomplish more with less money, as opposed to notions or ideas of untrained men which please the originator of these ideas but cause a loss in the revenue.

Time does not permit a detailed discussion of the various phases that an efficiency engineer has to consider in relation to mining installations, but a few practical illustrations are given to show the need of more thought and attention to the power end, the heart or prime mover of the whole system.

A few years ago a power plant was installed in Virginia to furnish power to coal mines and to eliminate the isolated power plants. This company at first met with strong opposition, but a few companies thought the idea a good one, and the results obtained by them started the operators thinking along the line of central-station power and its advantages and disadvantages. Today there are in the coal fields of this section seven large central stations, and another company recently organized, thus giving practically all coal companies the opportunity of purchasing power.

If such enormous expenditures of money have been made in these utilities, and if so many operators have encouraged them, why are there any private plants in existence? If they are a good thing for so many coal companies, why would not purchased power be advantageous to your mine? Why are you uncertain relative to this question? The reason, in my mind, is very apparent. There is still a wide difference of opinion relative to the advisability of purchased power, not so much from the advantages of its flexibility, ease of control, etc., but from the cost of operation.

Some Points on Purchased Power

Relative to the cost of purchased power, why do some of your neighbors tell you it is cheaper than your own plant, and others that central-station power is higher? There is a logical reason for this discrepancy of opinion; in fact, undoubtedly both of your neighbors are correct for their particular plants.

The question of purchased power, and why both of these opinions are correct, was discussed fully in an article in the July 1, 1916, issue of *Coal Age*, by H. P. Musser and F. B. Lamb. It was there plainly shown that it is just as absurd to make a decision relative to the advisability of purchased power from comparison with the results obtained from any other company as it is to assume you need a 15-hp. fan motor to ventilate your mine merely because there are a large number of fan motors of this size used.

In other words, each and every case has to be analyzed separately; the kilowatt-hours you now use and those you would use with purchased power, as well as the demand charge, should all be carefully considered. It might be added here that many companies have made the mistake of assuming that the kilowatt-hours now used will be the same as will be used with purchased power. Actual cases have been known where this consumption was less and other cases where it was 100 per cent. higher. Future conditions and additional load should also be carefully considered.

Now, central-station power is comparatively a new thing for coal mines. Determination of rates and proper composition of contracts, to be fair to each party, has become a specialized branch of the electrical profession as applied to coal-mining work. You have probably read over some power contracts carefully, and when you had finished wondered what it was all about.

I have known of many instances where contracts were signed without an analysis of conditions or due consideration given to the contract proper. Is it surprising, then, that some are dissatisfied? There are many companies that should buy power, and there are others who will still make the mistake of not putting in their own plant.

Another Reason for Difference in Opinion

It may be added that another cause of the difference of opinion relative to the cost of purchased power is the widely different rate (both secondary and primary) of the various power companies. The total bills are rather hard to compare, due to different methods used by power companies of basing the demand charges, while the secondary rates can readily be compared. Curves have been compiled showing the comparison of rates of various power companies, the comparison of primary charge being based on the average results obtained from actual tests.

Points taken at different parts of this curve show the following percentages based on four power companies which have practically the same rate:

SECONDARY CHARGE

	Per Cent.	Per Cent.	Per Cent.	Per Cent.
At 10,000 kw.-hr.	112	101	98	95
At 40,000 kw.-hr.	100	96	68	73
At 500,000 kw.-hr.	128	111	64	81

TOTAL BILLS

	Per Cent.	Per Cent.	Per Cent.	Per Cent.
At 10,000 kw.-hr.	112	101	98	95
At 40,000 kw.-hr.	100	96	85	84
At 500,000 kw.-hr.	131	111	102	108

It will be noted that the secondary rate and total bills for small consumptions are fairly uniform. However, there is a wide difference at the consumption of power, which would probably strike the average operation.

If the foregoing, including the rate just mentioned, are self-evident facts relative to this important question to the coal operator, he should not spend thousands of dollars and bind his company in a long-term contract without giving the matter careful consideration.

The marked economies that can, under proper conditions, be obtained with purchased power have been a strong factor in demanding the attention of the operators to efficiency engineering. The selection of the electrical equipment for a new mine is of high importance, and there are many points to consider. The size of the lease, quality and thickness of coal and the output desired are, of course, the important factors in the determination of the amount and size of equipment necessary.

If the development will be distributed over a large area, or if the drift mouth is a considerable distance from the natural location of a power house, the source of direct-current supply must be brought closer to the working places. This can be done by locating a motor-generator or rotary near the drift mouth or inside the mine and converting to direct current from alternating current, which is generated by the coal company's own plant or else purchased from a central station.

Too much emphasis cannot be laid upon the importance of selecting either a generator or converting apparatus of the proper size, speed, etc., to take care of the power requirements of the mine. It is almost as poor engineering to select equipment too large as too small, and the fact that voltage and power are so often confused has led many companies to install apparatus entirely too big for their requirements. A machine too large is an expensive luxury, as the load factor and efficiency are low. Cases are known where a large machine was bought second-hand because it was cheap. In the end it was very expensive, as the additional cost for a machine of the proper size was soon lost in the increased monthly expense of operating the inefficient unit.

Mine loads come at irregular peaks or swings, these peaks extending in most cases over a short period of time. The generator or converting apparatus must, of course, have capacity enough to handle these peaks. To meet these requirements the manufacturers have designed generators and converting apparatus capable of handling large overloads for short intervals.

Average Load Factor Decided From Many Tests

From exhaustive tests on various coal mines in West Virginia and Kentucky, the average load factor was found to be between 25 and 30 per cent. Nine plants of 150-kw. capacity each were tested, which plants showed the following average data:

$$\frac{Horsepower\ installed}{Horsepower\ connected} = 1.72$$

$$\frac{Horsepower\ installed}{Horsepower\ peak} = 2.82$$

Thirteen plants of 200-kw. capacity each showed the following average results:

$$\frac{Horsepower\ installed}{Horsepower\ connected} = 1.60$$

$$\frac{Horsepower\ installed}{Horsepower\ peak} = 3.97$$

The kilowatt-hours per ton of coal mined is naturally variable for different mines, due to the difference in mining conditions, variations in the hardness of coal, length of grades, ventilating, pumping, etc.

Assume a high average of 4.5 kw.-hr. per ton of coal mined, a monthly output of 10,000 tons and a consumption of 45,000 kw.-hr. per month. With a 27.5 per cent. load factor this means a 5-min. peak of 212 kw. A 150-kw. generator or converting equipment, with a 25 per cent. overload for two hours and a momentary overload of 100 per cent. would be amply large to handle all ordinary cases as cited above. In designing the building to house this machine, provision should be made for the ready addition of a second or third unit, should future developments warrant such an increase.

It is evident from this data that it is the heavy peaks or swings that must be prepared for, and right here is where the combination of alternating and direct current in and around the mine often makes the economical and efficient use of power possible; through driving with alternating current such apparatus as would inherently cause high peaks, on the converting apparatus. In connection with a power contract, however, signed on the connected-load method the above procedure may or may not be advisable, due to the increase of primary charge.

I have in mind one coal company that has two 150-kw. motor-generator sets installed. The hoist and all tipple motors are operated on direct current and the kilowatt demand, as shown by a curve-drawing meter, is 210. The all-month efficiency of the motor-generator sets varies from 45 to 55 per cent. This would indicate that the sets are not carrying continuously anything like their rated capacity, but the two must be maintained simply to take care of the peak loads. By a rearrangement of apparatus one set could be dispensed with and the all-month efficiency of the other set increased approximately 20 per cent. Now, assuming that this company requires 33,000 kw.-hr. a month on the direct-current side to run the mine, that that power costs one cent per kw.-hr., a 20 per cent. increase in efficiency means a saving of $160 per month or $1920 a year. Capitalized at 6 per cent. this means interest on an investment of $32,000. This is an extreme, but not an exaggerated case.

There are many differences of opinion with reference to the relative merits of rotary converters and motor-generator sets, and in every case a decision should be based on the conditions affecting operation. Briefly, a rotary converter is a much more efficient machine and in general will stand greater overloads without serious commutation troubles. On the other hand, if there is a poor regulation in the alternating-current voltage supply, the rotary voltage is influenced more than that of the motor-generator set. To raise or lower the direct-current voltage, or to compound it quickly, the motor-generator set has the advantage. If it is desired to use the set for the power factor corrections, the synchronous motor has its advantage. Thus when the duty and conditions to be met are known, the choice is a matter of selecting that apparatus which will give the most satisfactory and economical results.

How To Select the Motor

In selecting motors for hoists, tipples, fans, etc., it is essential that both the starting and running conditions be known; and in the case of a hoist, the cycle of operation is often essential. If an induction motor has a high starting-torque duty and low running-torque duty, it is expensive to put in a squirrel-cage motor of a large enough size to start the load. To do this means poor power factor, lessened efficiency and as a consequence loss of power. In such a case a wound-rotor induction motor should be selected.

In many mines pumping is an important item, requiring large power consumption. Where alternating-current central-station power is available, the problem should be investigated to determine if a saving can be effected by doing the pumping with alternating-current motors. I know of one case where the cost of power was reduced 30 per cent. by putting alternating current motors on the pumps.

The question of the best method of bonding can never be settled once and for all. New methods are being tried, and the present high price of copper makes attractive the elimination of copper bonds by the electric welding of the fishplates to the rails. In fact there are many companies that could have their track welded from the salvage value of the copper scrap secured from their present return, and in so doing would eliminate future bonding maintenance charges.

In the installation of feeder circuits for mining machines, fans, trolley, etc., it is a common error to keep

each circuit separate and independent of the others, and no advantage is taken of the diversity factor of the minimum load and the maximum return from the investment in copper is not utilized.

The question of feeding the gatherer and hauler of mine cars with hay or "canned juice" is one that is demanding the attention of the wideawake operator. He knows from experience all about the "hay burner," but when it comes to feeding an inanimate object with an in isible substance, he has stepped out of his realm; and many operators again find themselves in a different phase of the electrical field.

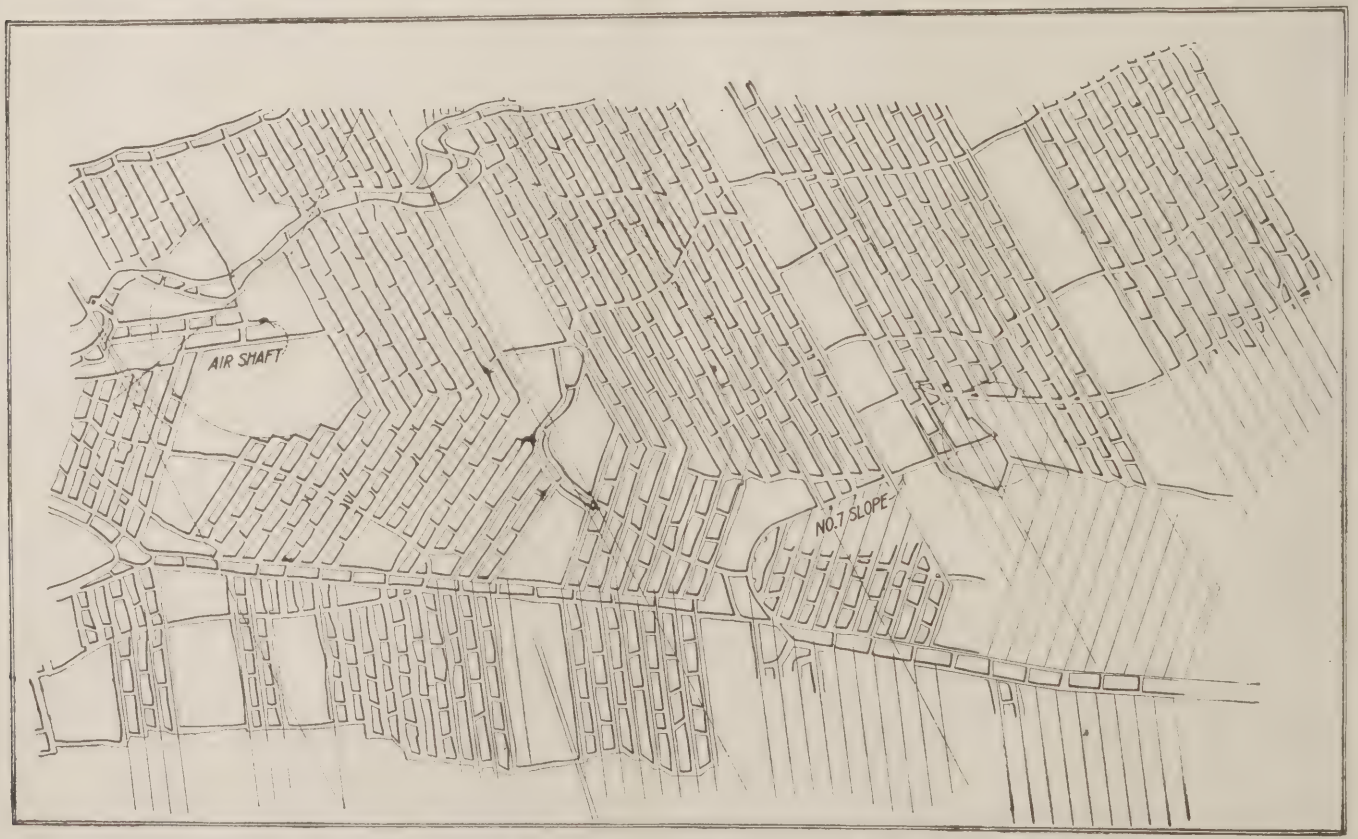
The limits of this article do not permit a discussion of the many considerations calling for investigation relative to the storage-battery locomotive. Suffice it to say, however, that although this type of equipment is comparatively new, the field of development is unlimited. At the present time, however, caution and exact analysis of conditions are advisable. Wherever possible the cycle of operation of the locomotive should be known, methods of charging should be carefully considered, and it should be borne in mind that where power is purchased one method of charging may cost 100 per cent. more than another.

The successful single-phase alternating-current locomotive for coal mines, with its elimination of substations and converting apparatus, or to go even further the wireless transmission of energy, the possibilities of a gigantic central station located in the coal fields to transmit power to Chicago, instead of shipping coal there, are not altogether idle dreams, and the conclusions one is forced to draw are that coal operators cannot afford to ignore the trend of the times.

Coal-mining electrical engineering is a highly specialized subject in which the engineer should know mining conditions, the problems of the operators, and should give the subject undivided attention. Further, he should not connect himself to any other pursuit that will not enable him to always give unprejudiced and unbiased opinions. In other words, his recommendations should be based in full sympathy with his client's conditions, financially and otherwise. That the operators are realizing the great advantage of employing engineers regularly is conclusively proved by the large number who, in the last year or two, have retained the services of engineers to act in a consulting capacity and to make regular inspections and reports on their mines.

Five Features in Mine Workings

It is of interest to notice on the accompanying map the following five features, which are of importance in the working of a mine:



1. The large shaft pillars that are used to protect the shaft from any movement of the rock.

2. The large pillars that are left about every 11 rooms. These pillars are 150 ft. thick and prevent any squeeze that comes on the mine from spreading beyond the pillars.

3. The future direction of every room is planned, and the rooms are driven according to these plans.

4. The regularity in the size of the pillars left between rooms. There is no "hogging," as is seen in so many mines. The idea is not to get some cheap coal now, but to get all the coal.

5. This map shows very prominently the contours of the coal and also the top of the anticline. The contours are shown by the turns of the headings, which are driven almost level. The anticline is shown by the way the rooms head into one another.

ILLUSTRATING FIVE FEATURES THAT ARE OF IMPORTANCE IN THE WORKING OF A MINE

Block Signal System for Coal Mines

By FRANK HUSKINSON
Leadville, Colorado

SYNOPSIS—*Most block signal systems at present in use are manually operated. These are successful as long as the motorman does not forget to throw the switch. An automatic signal system such as here described, which does not depend on manual operation, has many advantages.*

ONE of the most important applications of electricity in coal mining is the signaling system. Of these a number of different types are in use today. The advantages and disadvantages of the different types have been matters of discussion among mine superintendents and electricians for some time. Almost all block signal systems in use today are operated by the motorman or switchman throwing in or out an electric switch that controls a set of electric lights at the various stations. Almost all block signal systems are reliable as long as the motormen attend to the proper throwing of the switches.

A reliable, safe, self-regulating and self-resetting automatic block signal system has long been one of the needs of all coal mines that employ electric locomotives for haulage. Below I give a description and details of a safe system, which is the only one of its kind that I know of. This is an automatic block signal system that has proved absolutely reliable, and in which the only requirements are that the trolley wheel be on the wire and the current turned on to insure operation.

In Fig. 1 is shown a complete connection diagram of the two block stations. As many signal lights and signs as are needed may be connected from the line marked "Power Line" and the return or ground. These signal lights and signs are generally located at convenient places in the mine. The blocks themselves are usually placed at some point out of the way of all meddlers and persons that have no business with them.

Outside Station May Be Placed in Electric Shop

The electric shop is the most convenient place in which to locate the outside station, while a good, safe place can easily be made for the station inside the mine. The details of the arrangement that is used on the trolley lines for the operation of the blocks is shown in Fig. 2. It consists of a hardwood strip about 4 ft. long fitted with two pieces of angle iron, so arranged that as the trolley wheel comes in contact with the angle piece it will make a connection between the trolley wire and the angle iron as long as the trolley wheel is passing along the section. This allows the trolley-line current to flow through any lines that may be connected to the angle-iron piece as long as the wheel is passing over it.

In Fig. 3 is shown a detail of the solenoids and levers that operate the arms *Z*, Fig. 1. The solenoids are wound to suit the voltage and other conditions. However, there must be enough turns of wire on the solenoids to make them strong magnets, so as to produce a quick action on the plunger, which in turn operates the levers that move the arms. The capscrew is for adjusting the air space between the plunger and the magnet.

Fig. 4 is a detail of the lever, showing the catch arrangement on the end. In Fig. 5 is shown a detail of the relays, the windings on which, as will be noticed in Fig. 1, are in series with a lamp. This lamp is a 32 cp., 120-watt carbon globe. Of course, the size of the lamp or the number of lamps that are used in series with the relays will determine the size and amount of wire that will be required to make the relays strong enough to hold the lever marked *B*, in Fig. 5. The relays should have enough wire and be so arranged as to insure quick action on the lever *B*.

In Fig. 6 is shown a detail of the contact segments. The dimensions, etc., given in the diagram can be varied to suit the requirements of the rest of the block signal. Fig. 7 shows a detail of the arms *Z*, in Fig. 1. These arms are hardwood strips of suitable size with the four contacts arranged as shown at *A*, Fig. 7.

Working Parts of the Block Signal System

Fig. 8 shows the star wheel. This wheel is adjusted and fastened to the arm *Z* and can be made out of fiber or iron and the dimensions made to correspond with the rest of the block signal. In Fig. 9 is shown a detail or a signal box. As many of these boxes or lights as are wanted can be wired off the line marked "Power Line" in Fig. 1, and the return.

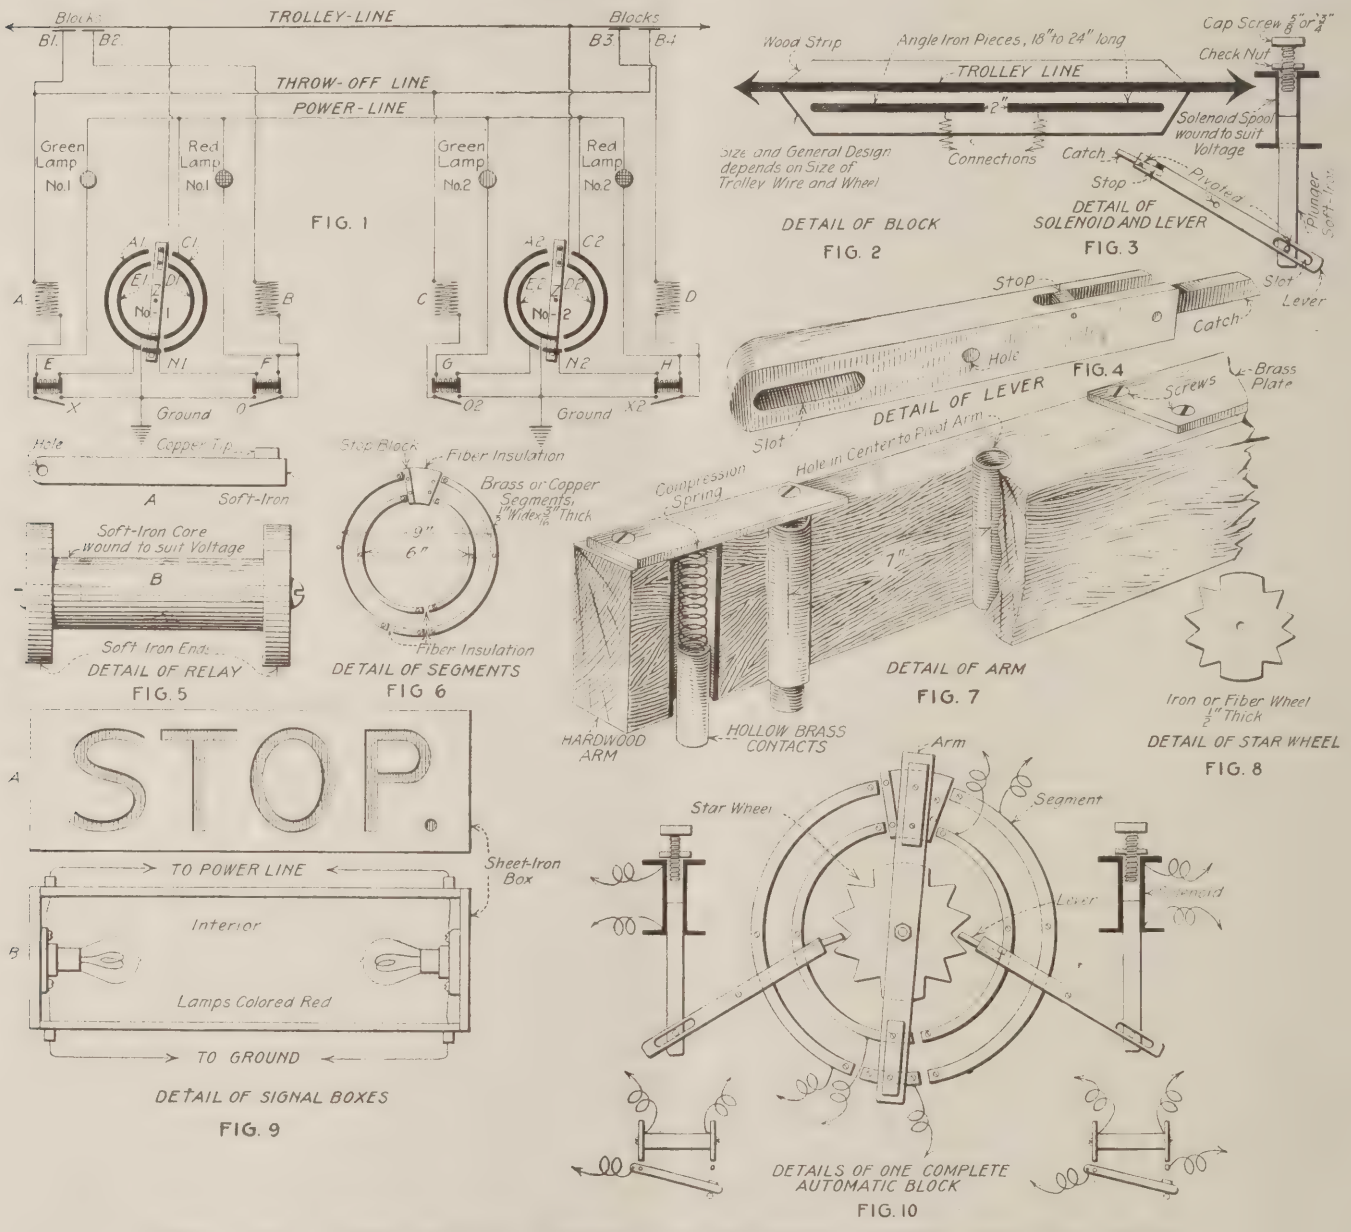


Fig. 10 shows in detail a complete automatic block assembled. The arm is shown in the neutral position. A careful study of Fig. 10 will give a clear idea of the working parts of this block signal, while a careful study of the diagram, Fig. 1, and the detailed description here given will convey a good idea of the operation of this automatic block signal system.

The operation of this automatic block signal system is as follows: The arms *Z*, both being in the neutral position and the locomotive going into the mine, the trolley wheel closes the circuit for an instant at *B*1, allowing the trolley line current to flow to the solenoid *A* and thence to the contact *X* on the relay *E*. But the circuit is open here, so that there is no operation of the signal when the circuit is closed on *B*1. The trolley wheel now passes from *B*1 to *B*2.

As soon as the wheel closes the circuit at *B*2, the current travels to the solenoid *B*, then to the relay *F*, then to the contact *N*1, through the arm *Z* on No. 1, to the contact *E*1, and to the ground. This completes the circuit, causing the lever on the relay *F* to rise and close the circuit at *O*. This allows the solenoid *B* to receive the trolley line current passing direct through its windings to ground. Thus the solenoid *B* operates the levers that move the arm *Z*. This causes the arm *Z* to open the circuit on contacts *N*1 and *E*1, and close the contacts *A*1 and *E*1 simultaneously. It also closes contacts *C*1 and *D*1 together. This causes

the trolley line current to flow from the contact *D*1 to the contact *C*1 through the arm *Z* on No. 1, thence to the power line, to the green lamp No. 1, to the relay *E*, to the contact *A*1, to the contact *E*1, and thence to the ground, causing the green lamp No. 1 to light up and the relay *E* to close the lever at *X*, thereby connecting one side of the solenoid *A* to the ground. The same current also traverses the power line to the red lamp No. 2, to the relay *H*, to the contact *N*2, through the arm *Z* on No. 2, to the ground, causing the red lamp No. 2 to light up and the relay *H* to close the lever at *X*2, thereby connecting one side of solenoid *D* to the ground. Any lamps and signal boxes that are connected to the power line and the ground will thus light up and stay lit until the block is again moved. This is the operation of the signals as the locomotive goes in.

causes the solenoid *D* to operate the arm *Z* on No. 2 This opens the circuit between the contacts *N*2 and *E*2, and allows the relay *H* to open the circuit at *X*2. The red lamp No. 2 goes out, but a fraction of a second afterward the circuit is closed between the contacts *C*2 and *D*2 by the arm *Z* on No. 2. This allows the trolley-line current to flow from the contact *D*2 to *C*2, thence to the power line, to the green lamp No. 2, to the relay *G*, to the contact *A*2, to the contact *E*2, and thence to the ground, causing the green lamp No. 2 to light up and the relay *G* to close the circuit at *O*2 thereby

FIGS. 1 TO 10. DETAILS OF AN AUTOMATIC BLOCK SIGNAL SYSTEM FOR COAL MINES

When the locomotive comes to the inside block the operation is as follows: The trolley wheel closes the circuit between the trolley line and *B*3. This allows the current to travel to the solenoid *D*, to the relay *H*, to the contact *X*2, and thence to the ground. This connecting one side of the solenoid *C* to the ground. This makes no difference at block No. 1, as the current in the power line is the same. But just an instant after the trolley wheel closes the circuit at *B*3, it breaks this circuit and closes the circuit at *B*4. This allows the current to flow to the solenoid *C*, to the relay *G*, to the contact *O*2, and thence to the ground, causing the solenoid *C* to operate, which puts the arm *Z* back on the neutral position at No. 2. This opens the circuit between the contacts *C*2 and *D*2, also between the contacts *N*2 and *E*2. The green lamp No. 2 goes

out, and at the same instant the current flows along the throw-off line to the solenoid *A*, to the relay *E*, to the contact *X*, and to the ground, causing the solenoid *A* to operate. This puts the arm *Z* on No. 1 back to the neutral position, opening the circuit between the contacts *C*1 and *D*1. It also opens the circuit between the contacts *A*1 and *E*1, and closes the circuit between the contacts *E*1 and *N*1. The blocks are now both back on the neutral position the same as before the locomotive started in.

The operation of the blocks with the locomotive going out will be as follows: The trolley wheel closes the circuit between the trolley line and *B*4, allowing the trolley-line current to travel to the solenoid *C* and to the relay *C*. The circuit is open at this point. Simultaneously the current travels the throw-off line to the solenoid *A* and to the relay *E*. The circuit is open at this point, so that on *B*4 there is no operation of the blocks, the same as on *B*1 coming in there was no operation. An instant later the trolley wheel leaves *B*4 and connects *B*3 with the trolley line. This allows the current to travel to the solenoid *D*, to the relay *H*, to *N*2, to *E*2, and thence to the ground. This causes the solenoid *D* to operate the arm *Z* on No. 2, thereby opening the circuit between *E*2 and *N*2 and closing the circuit between *C*2 and *D*2. This also closes the circuit between *A*2 and *E*2, allowing the current to travel from *D*2 to *C*2, then to the power line, to the green lamp No. 2, to the relay *G*, to the contact *A*2, to *E*2, and thence to the ground. This causes the green lamp No. 2 to light up. The relay *G* closes the circuit at the contact *O*2, thereby connecting one side of the solenoid *C* to the ground. At the same instant the current traverses the power line to the red lamp No. 1, to the relay *F*, to contact *N*1, to *E*1, and thence to the ground, causing the red lamp No. 1 to light up and the relay *F* to close the circuit at the contact *O*, thereby connecting one side of the solenoid *B* to the ground.

Further Operating Details of System

When the locomotive comes out the trolley wheel closes the circuit at *B*2, so that the current flows to the solenoid *B*, to the relay *F*, to the contact *O* and to the ground. This causes the solenoid *B* to operate the arm *Z* on No. 1. This opens the circuit between the contacts *N*1 and *E*1; the red lamp No. 1 goes out and the circuit is closed between *C*1 and *D*1. It is also closed between *A*1 and *E*1. This allows the current to flow from *D*1 to *C*1, to the green lamp No. 1, to the relay *E*, to the contact *A*1, to the contact *E*1, and thence to the ground. This causes the green lamp No. 1 to light up.

The relay *E* also closes the circuit at *X*, thereby connecting one side of *A* to the ground. No change takes place on No. 2, as the current in the power line is unchanged. An instant after the circuit is made between the trolley line and *B*2, the trolley wheel leaves *B*2 and closes the circuit between the trolley line and *B*1. This allows the current to flow to the solenoid *A*, to the relay *E*, and to the ground, causing the solenoid *A* to operate the arm *Z* on No. 1, bringing it back to the neutral position. This opens the circuit between *C*1 and *D*1, and also between *A*1 and *E*1, and closes the circuit between *E*1 and *N*1. At the same instant the current travels to the throw-off line, to the solenoid *C*, to the relay *G*, to the contact *O*2, and to the ground, causing the solenoid *C* to operate the arm *Z* on No. 2, throwing it back to the neutral position. This opens the circuit between *C*2 and *D*2 and also between *A*2 and *E*2. It closes the circuit between *E*2 and *N*2. This brings the blocks both back to the neutral position and ready to repeat the same action over again.

Minecdotes

The Air Car

In former years pranks were perpetrated frequently upon the new recruit who was being initiated into the odds and ends incident to mine work. Sometimes the greenhorn proved himself master of the situation. I remember one case in particular, several years ago, where this proved to be the case. A new driver, on his second or third day in the mine, came to the sidetrack one afternoon empty handed, with the announcement that he couldn't get any coal that trip, the men on the heading and air-course having gone home on account of smoke. Now, the driver boss, though he was quite a hustler, was also a bully, and when he thought he knew his man he would ridicule, terrify and abuse him unmercifully. In those days drivers were plentiful and jobs were not.

"You homesick-looking jay. You red-brush farmer. You simple rube. What did you mean by letting those men go home? I've a good mind to send you home, too. Why didn't you get the air car for them?"

"The—air—car?" stammered the culprit.

"Yes—the air car! Don't you know what an air car is?"

The new driver confessed that there were a lot of things he didn't know anything about—one of them being an air car.

"Well, if you are going to drive here, you want to wake up and get wise. Now, you burn her to the outside and get the air car. Bring it in on the motor trip. Don't you ever let anybody go home again for the want of air."

The man ran all the way to the outside and, of course, received the "horse laugh" when his errand became known. When he got back to the sidetrack his humiliation was further witnessed. He, too, might have enjoyed the joke had he not been so conscious of the driver boss' far-stretched sense of humor in "rubbing it in"; but his silence was ominous, and the driver boss began to feel uneasy.

On the outside that evening the recruit was waiting for the driver boss. He said simply: "I want you to show me what an air car is."

"Why, you simple fool," the driver boss said with a weak show of his former bravado, "don't you know that there ain't no such thing as an air car?"

The driver threw off his coat. "Pardner, I may be foolish on this air-car business, but I'm going to find out if I'm the only fool here."

They didn't fight, because the driver boss, after sizing his man up, acknowledged that for once, he, himself, was a fool, too.

Repairing Locomotives Underground

At one of the large mines of the Northwestern Mining and Exchange Co., in Clearfield County, Pennsylvania, is a rather interesting underground motor room in which all repairs are made to the haulage locomotives. The small gathering locomotives are sent to the surface to undergo repair work; but the large ones, which cannot be run onto the cage and hoisted to the surface, are repaired in the mine when that is possible.

The motor room is about 15 to 16 ft. wide. The walls are of brick and the roof of steel I-beams. A

AN UNDERGROUND MOTOR ROOM

track runs through the room at one side, as is shown in the accompanying illustration. A large pit permits the mechanics to work under a locomotive. At the left of the room can be seen the work bench, which is equipped with all the various vises and tools needed for repair work. The crane in the foreground can handle a weight of 15 tons. It is operated by hand and can travel the full length of the room. Electric lights furnish sufficient illumination for the machinist and his helper.

Use of Hot Liquid Pitch in the Making of Briquettes

A plant for making briquettes with the aid of hot liquid pitch which is to be delivered by rail direct from the tar works is being erected at the Hohenzollern Colliery, near Beuthen, in Upper Silesia. The novelty consists in the use of liquid pitch transported in special tank wagons by railway. This was first tried in August, 1914, in the Essen district, when ordinary boiler tanks of 15 tons capacity were used. The tanks had only three miles to travel by road, but with charging and discharging the operations took seven hours; yet there was a saving in material and cost.

The State Railway line is to be utilized for the plant now being completed in Silesia. The process adopted is the Fohr-Kleinschmidt, which, worked on the old plan, was a little more economical than other processes, but promises a considerably increased economy when starting with liquid pitch on the new plan. It might be thought that liquid pitch and powdered or disintegrated coal might be run directly together in briquetting, but such attempts only yield a lumpy product devoid of strength.

By the Fohr-Kleinschmidt process the cold pitch as supplied, without fine disintegration, is heated first to 100 deg. C., the thick fluid being then transferred to a melting drum kept at a temperature of 130 to 170 deg., from which the thin liquid flows into a receptacle to be further heated and sprayed by means of steam or compressed air. The sprayed particles congeal in a mixing drum while still floating in the air; in this condition the pitch, forming a sooty dust, meets the finely disintegrated coal and is mixed with it in slowly revolving drums, fitted with stirring and lifting devices, being pressed into briquettes at temperatures ranging from 50 to 80 deg. C.

The Engelsburg Colliery of the Verein fur Bergbau and Stahlindustrie at Bochum has eight presses at work, yielding some 600 or 700 tons of briquettes daily. The pitch consumption has been reduced 1 per cent. by the adoption of the Fohr-Kleinschmidt process, and the hot pitch is to make a further reduction in cost possible. There will be less waste, no need for disintegrating and remelting the pitch, and several operations will be much simplified; the disintegration affected the eyes of the men in charge, and this will now be eliminated. The emptying of the tanks by compressed air takes 15 min. The pitch to be used in the new plant in Silesia is distilled at a temperature of 250 deg. C.

Hungarian Editor Opens Co-operative Mine in West Virginia

About two months ago Martin Himler, the editor of the Hungarian miners' journal, *Magyar Bányaslap*, organized a company on a coöperative basis. About 85 per cent. of the stockholders are Hungarian miners, belonging to every district where men of that nationality are now working.

Mr. Himler intends that this camp shall be a model operation and he hopes to make a careful study of the reasons that cause the Hungarian miners to wander round from mine to mine. When the experiments are ended he expects to be able to make practical suggestions to other operators who are employing Hungarian labor as to the manner in which Hungarians may be made more steady.

Half the earnings will be distributed to the stockholders in the form of dividends and the other half among the miners in proportion to their earnings. The mine is located at Ajax, W. Va., 18 miles east of Williamson.

PICKING TABLES on which coal is cleaned should have a travel of not over 50 ft. per minute and should be of sufficient width so that the coal will spread out thin enough that lumps of coal will not be covered by others.

Engineer Regiment for France

There is now being recruited at Camp Meade, Md., a special engineer regiment for quarry work in France. This organization is known as the 28th Engineers, National Army, and its purpose is to operate the existing quarries and to open and operate such new quarries as may be needed in France to supply the crushed stone for the building of the highway systems, for railroad ballast, for concrete, and such uses.

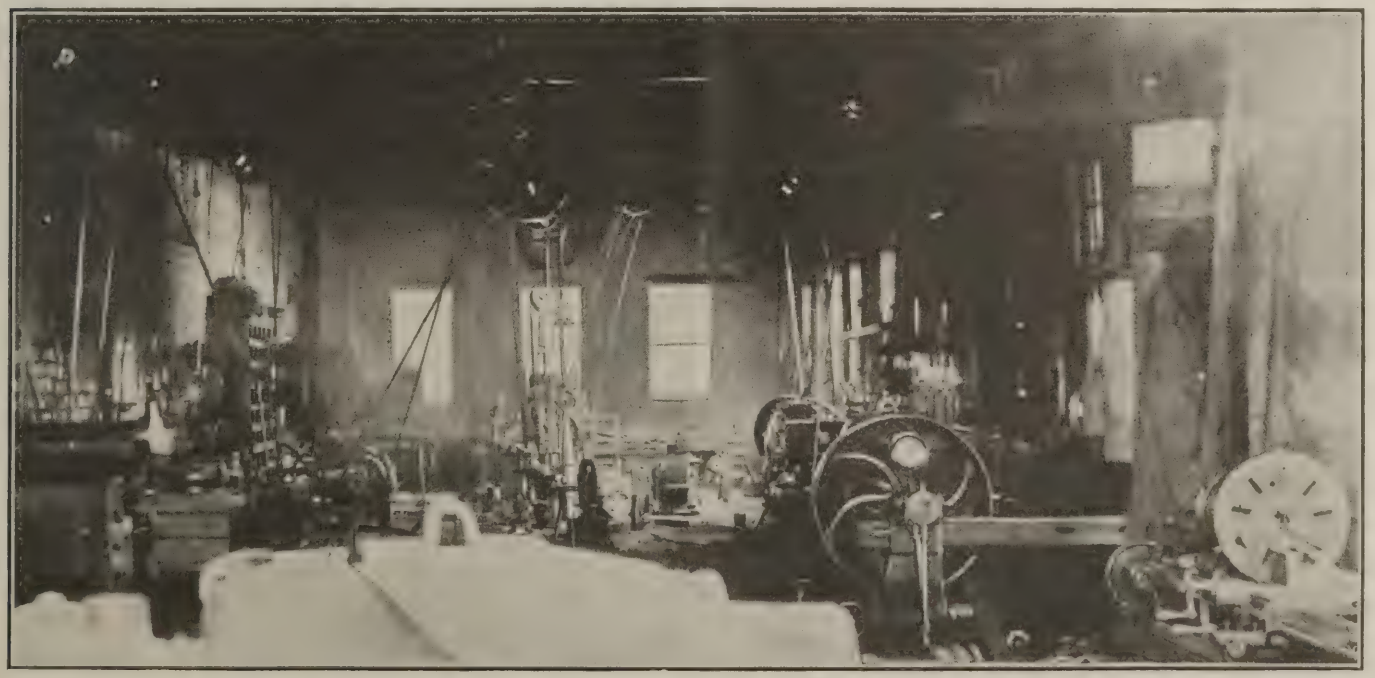
Already two complete companies of 250 men have been recruited and equipped for service abroad. On the roster are the names of expert quarrymen, rock and churn-drill runners, blasters and powdermen, crushermen, stationary steam engineers, locomotive engineers, steam shovel men and cranemen, clamshell bucket men, blacksmiths, machinists, electricians, compressor men, trackmen, cooks, master mechanics, quarry superintendents, foremen, and railroad brakemen and switchmen from every state in the Union.

Each company will have a complete quarry equipment of steam shovels, standard gage engines and dump-cars, well drills, tripod drills, hammer drills, jaw and gyratory crushers, screens, belt conveyors, etc., necessary to produce a minimum output of 1000 tons of crushed rock per day. This equipment has already been ordered and has been shipped to the point of embarkation.

All men who volunteer for this service will be enlisted as privates, but those who show themselves qualified will be raised to the grade of noncommissioned officers. Any specially qualified man who is beyond the present draft age may enlist by showing proper qualifications and passing the requisite physical examination.

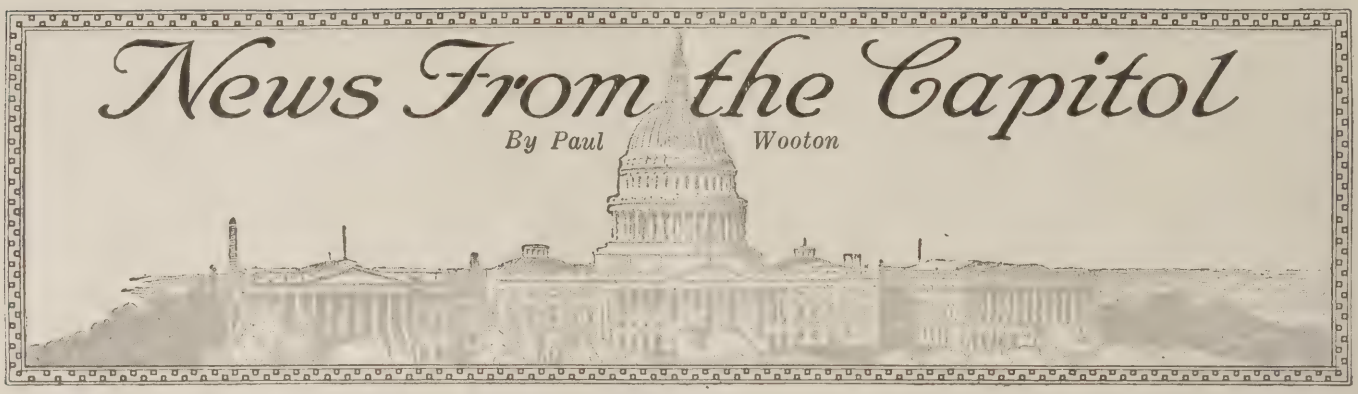
The officers of this regiment are all professional engineers who have done quarry and heavy rockwork in all parts of the United States and are graduates of the officers' training camps.

The 28th Engineers offers an exceptional opportunity for the quarrymen of this country to show their skill and courage, as the success of the American Army operation in France is dependent upon the roads and railroads, which in turn are largely dependent upon the supply of crushed stone.



Any inquiries regarding service in this regiment will be answered on writing to the Commanding Officer, 28th Engineers, N. A., Camp Meade, Maryland.

Foundry and Machine Shop at a Central Pennsylvania Coal Mine



At one of the mines owned by a large coal operator in central Pennsylvania there is installed a large machine shop and, what is an unusual feature around a mine, a foundry. The machine shop is well equipped, containing the following machinery: A thread-cutting machine; a radial post drill; a pipe machine; a portable hand-power crane; one lathe 18 in. by 9 ft.; one 24-in. planer; an hydraulic press; one lathe, 34-in. swing, 18 ft. long; a test gage for steam; two small lathes; a blacksmith forge; a centering machine; a power emery wheel, and a power hacksaw. All of these tools are driven by belt drive from a mainshaft which extends down the center of the shop. The power is furnished by a simple 10 x 18-in. slide-valve engine. Fourteen men are employed. (View of shop is given below.)

Immediately adjacent to the machine shop is a small motor repair shop in which the gathering motors are taken care of. On the opposite side of the machine shop the blacksmith shop is located.

The foundry is a short distance away from the machine shop, and is equipped with a 6-ton cupola furnace. All the iron castings used at this and two other mines owned by the same company are made here, as are also most of the brass castings. The largest casting ever turned out by the foundry weighed 1600 lb. At present the iron is handled from the cupola to the molds by hand ladles, but the company intends to install a small hand-power traveling crane in the near future. Three men are employed in the foundry—a founder and two apprentices.

INTERIOR VIEW OF WELL-EQUIPPED MACHINE SHOP AT A CENTRAL PENNSYLVANIA COLLIERY

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Metropolitan Bank Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 703, Metropolitan Bank Building, Washington, D. C., while at the capital.—Editor.]

Lovett Attributes Rail Congestion to "Tag System" of Army and Navy

In a statement issued by Judge Robert S. Lovett, Director of priority, on Jan. 5, the "tag system" of Army and Navy officials was blamed for much of the freight congestion. The public, he said, had been misinformed by statements that priority orders, issued by him and since suspended by Director General McAdoo, had caused the railroad tie-up. Judge Lovett's order is as follows:

It is being reiterated before committees and in various reports, and repeated from day to day in newspapers, that the present congestion in railroad transportation is due in large measure to numerous and unwise "priority orders," and it is well known and is generally published that I am in charge of priorities. The obvious inference, therefore, is that such ill-advised priority orders were issued by me. Nothing could be further from the truth.

No one knows better than I have known all along that reckless and indiscriminate issue of priority orders would add enormously to the transportation difficulties, and that the greatest caution should be observed in issuing such orders. The result is that since my appointment by the President, in August last, I have issued but five orders awarding priority in transportation, to wit: Order No. 1, issued Aug. 20, directing the movement of coal to the Northwestern States via the Lakes; Order No. 2, issued Oct. 27, restricting the use of open-top cars; Order No. 3, issued Nov. 2, giving preference to certain coal shipments from Utah and Wyoming mines; Order No. 4, issued Nov. 29, according priority in the shipment of certain cattle foodstuffs to the drought-stricken sections of Texas and New Mexico; and Order No. 5, issued Dec. 7, according priority to perishable freight, foodstuffs and certain military supplies, and to coal, coke and certain war materials.

No railroad man or other person with knowledge of the facts has claimed or will claim that any of these orders has caused congestion or seriously hampered transportation.

The fact is that the so-called priority orders, which are more or less responsible for traffic congestion and of which complaint is made, are the result of an arrangement made by the railroads themselves and the supply departments of the Army, Navy and Shipping Board, with which I had nothing whatever to do. That arrangement was embodied in Bulletin No. 22, issued by the so-called "Railroad War Board" in July last, and is commonly referred to as the "tag" system. It prescribed a form of placard or tag which when tacked on a car entitled that car without further orders or instructions to preferred movement to destination. Large quantities of these placards were printed and distributed throughout the United States in the hands of quartermasters, agents, contractors and others getting material for the Government, and naturally one was tacked to every shipment made, whether urgent or not.

Consequently, everything bought was rushed to destination, with the inevitable result that terminals were crowded with materials before they were needed or could be unloaded. No complaint of this system was made or reported to me until late in November, and priority Order No. 5, issued by me Dec. 7, made provision for restricting and regulating the evil.

However indifferent one may be personally to misrepresentation, yet, where the performance of public duty is involved, the facts as they are ought to be stated. Of course, I know the misrepresentation was not intentional, and the unusual circumstances were such as to make it almost unavoidable.

Weekly Production Statistics

Bituminous coal production during 1917 was 544,142,000 tons, according to an estimate made by C. E. Lesher, the geologist of the United States Geological Survey, who is in charge of coal statistics. This is an increase of 8.3 per cent. over the 1916 production. December production did much to pull down the year's total. During the closing month of the year, the production was 42,050,000 tons. This is the poorest monthly showing since April.

Despite the extreme cold which prevailed over much of the coal-producing area, a good showing was made in the five working days of Christmas week, when the mines of the country produced 8,964,000 tons. Coke production during the same week was 538,276 tons. There was a decided decrease in the number of cars of anthracite coal forwarded. During the week ended Dec. 29 anthracite shipments were 29,228 cars.

Commenting on his figures, showing the limiting factors in coal production for the week ended Dec. 22, Mr. Lesher says:

Reports from almost every district indicate some improvement over the extraordinary depression of the week of Dec. 15. For the country as a whole losses due to all causes amounted to 31.9 per cent. of the full-time capacity, as compared with 42.3 per cent. during the preceding week. Improvement was reported in car supply, losses due to that factor declining from 30.8 to 24.8 per cent. Losses attributed to labor shortage and to mine disability returned to normal.

Recovery was most rapid in Illinois, Indiana and Ohio. In the last-mentioned state losses attributed to car shortage fell from 57.1 to 38.8 per cent. of full-time output. Western

Pennsylvania and the Irwin gas field also reported decided improvement in central Pennsylvania, however, conditions underwent little change. The Junior Philippi, Winding Gulf and Fairmont regions of West Virginia, and the Southern Appalachian district, reported increased losses due to car shortage. From the remaining districts of West Virginia and Kentucky a slight improvement was reported.

The production of Alabama was adversely affected by strikes and labor shortage; losses due to these causes amounted to 9.1 per cent.

The Southwestern region—Missouri, Kansas, Oklahoma, Arkansas—and the Rocky Mountain fields—Montana, Wyoming, Colorado and New Mexico—also reported substantial recovery from the depression of the week before.

Director of Railroads McAdoo Working on Coal Transportation Problem

Among the many pressing problems which confronted Director General of Railroads McAdoo last week, none took precedence over the transportation of coal. Dr. H. A. Garfield, the fuel administrator, conferred frequently with Mr. McAdoo. In fact, he seemed to be the one man who could see Mr. McAdoo whenever he wished. Mr. McAdoo's office was besieged throughout the week by prominent men representing powerful interests, but most of them were disappointed at not being able to secure personal interviews with him.

A schedule for distributing coal is being worked out. Every effort is being made to prevent cross-hauling. Distribution points are being selected from which the state administrators may order it into consumption.

All Priority Orders with Respect to Transportation Suspended

The following statement was issued by Doctor Garfield to clear up what apparently is a very general misunderstanding with regard to priority orders:

"By direction of Director General McAdoo, all priority orders heretofore issued with respect to transportation have been suspended and no further priorities may be claimed thereunder. Future orders for priorities will be issued in emergencies under Mr. McAdoo's direction as occasion may require."

National Coal Association Blames Railroads for Coal Shortage

All blame for the coal situation is laid at the door of the railroads by the National Coal Association. In a formal announcement the National Association says in part:

"There need not have been a fuel famine in 1917; there need not have been even a coal shortage. That there was a fuel famine, with its attendant suffering, was due solely to inadequate transportation facilities.

"So far as car supply in its effect on operations of mines is concerned, the mine operators feel encouraged by the centralized control of the railroads under Mr. McAdoo. They feel satisfied that sufficient cars will then be supplied to keep the mines running regularly somewhere near capacity. If this is done the producers can keep their men, because the wages now paid are the highest in the history of the industry, and compare favorably with those paid in other lines of industry."

FUEL ADMINISTRATOR GARFIELD has refused to issue priority orders to assure New York City 1500 cars of coal a day. The city's situation is serious.

In Lighter Vein

Some Qualifications!

The recent naming of county fuel administrators in the several counties of the state has been the subject of considerable comment. The Republicans, of course, did not expect many of them to be chosen from the G. O. P. and they got their expectations fulfilled. They did expect, however, that the men appointed would have more or less knowledge of the fuel business. In that, they claim, they have been disappointed in many instances.

They are telling a little story to illustrate the situation.

In a certain county where a fuel administrator was to be named there is an old man whose frank, blunt, good-natured manner is much on the style of Irvin Cobb's "Judge Priest," with whom most readers of current magazine stories are familiar.

Into this old gentleman's office one day came a young man for a confidential chat.

"Uncle John," he began, "I've just been offered the position of fuel administrator for this county by J. Walter Barnes, state administrator, and I want to get your advice about accepting it."

"Accept it, young man, by all means accept it," he said brusquely, "never turn down anything that's handed to you. Do you know anything about the fuel business?"

The young man admitted that he did not.

"Did you ever teach school?" the old man then asked.

"Yes, taught school for two years, some time back."

"Well, then, you are just the man for the place. If you don't know anything about the fuel business and have taught school you will make an ideal fuel administrator!"—*Charleston Mail.*

This Is the Life!

Following are some statistics taken from a coal operator's diary during 1916:

Threatened to be sued	300 times
Have been sued	0 times
Been asked about car supply	300,000 times
Told about car supply	23 times
Did not know about car supply	200,000 times
Lied about car supply	99,977 times
Shipped coal on contract	148,410 tons
Shipped coal on spot orders	15,240 tons
Loss on contract coal	$48,410.23
Profit on spot coal	50,460.48
Net profit	$2,050.25
Contributions to Y. M. C. A., Y. W. C. A., Belgian Relief Fund, Belgian Tobacco Fund, Boy Scouts, Tuberculosis Sanitarium, Church Building Fund (3 times), Destitute Widows (20 times), Destitute Orphans (1 time) and Salvation Army	$424.10
Living expenses for year	1,602.92
Total	$2,027.02
Balance cash on hand	23.23

THE LABOR SITUATION

General Labor Review

Everybody is working as hard as the railroads will let them, and some are working nine hours a day. The mine workers are showing themselves as willing to override contracts in the interest of production as the operators were in the interest of harmony. In the face of the enemy neither unions nor operators know any law but that of patriotism.

The mine workers expect to discuss the nine-hour day at the biennial convention to be held at Indianapolis. It is going to be a warm discussion doubtless, because it is a matter which everyone will see from a different viewpoint; for every man's judgment will be based on local conditions, and these vary markedly from place to place.

Why the Anthracite Miner Counts Twice

It is of importance that the anthracite miners produce a big tonnage, because the anthracite region is a small field far nearer than any other to a certain large population. If that population is not satisfactorily served by the anthracite mines, it must be more generously served than is necessary by the bituminous mines; and as these are more remote, such service will be obtained only with much waste of transportation. Moreover, the capacity for the production of anthracite is quite inadequate and hard coal cannot be satisfactorily replaced by bituminous coal. For this reason, it is necessary to do all possible to promote the production of anthracite.

Those who are so located that they can provide coal with minimum transportation should be asked to work more steadily and more hours than others. The bituminous mine workers for their part should fill the cars they receive as soon as they receive them. They should not shut down in the evening till all the cars supplied are duly loaded. If they have any objection to make, it should be made to the railroad authorities, who should cut down allotments when men have to work overtime to fill cars which other men in the same district could fill without working overtime.

Some Car Allotments Should Be Made Larger

But for the most part there is no hope in the bituminous region that the allotment will exceed what the operating forces can load. On most railroads the allotment will be such that a full day will be far less than eight hours. It is likely that the Government will regulate matters so that those men will be enabled to work the longer hours who mine coking coal and such coal as is transportable to market with minimum effort.

It is probable also that the railroads will be so regulated that miners will be enabled to work at least seven hours whenever the mines run. It is a mistake to put the allotment so low that while the mines run every day they will run each day far below capacity. It is too much to ask men to travel a long distance, put on their dirty clothes and get all begrimed for a few hours' work. A few less working days would be better. The men would have a chance to make use of the time thus afforded them.

Talk Much About Duties, Little About Rights

But it will take some time for things to adjust themselves. Till that time occurs everyone will have to have patience and talk much about their duties and little about their rights. Let every man be severe in his judgment of himself and sparing in his condemnation of the railroads and the Fuel Administration. Everything cannot be done at once; not everything done will be right, certainly not at first. We all have to learn, not least of all the fuel administrators who know little about either coal or transportation and find themselves tackling problems which would baffle even experts. These men have been chosen for their disinterestedness and not for their knowledge of the conditions to be met. If care is taken to keep them informed of the situation, they will probably solve matters in the end with as fair a degree of efficiency as we have a right to expect.

The New Year brought more recognition of the rights of the salaried men which have been so long neglected. Foremen and other monthly men employed by the G. B. Markle Coal Co., whose salaries were not subject to the contracts made by the mine workers, received bonuses ranging from $15 to $100 for the efforts they had made to increase the production.

Reading Strives Mightily To Get Tonnage

The Philadelphia & Reading Coal and Iron Co. showed its determination to make monetary sacrifices to obtain coal when on Dec. 28 its big Bear Run breaker was rendered temporarily idle by the breakage of some of the machinery. The company ordered the 900 men to remain on the job under pay till the repairs were made. As a result 600 tons of coal were run through the breaker after it was repaired.

A few anthracite mines in the Southern field worked on New Year's Day. The Philadelphia & Reading Coal and Iron Co. had six collieries, out of 40, working. Around Hazleton and Wilkes-Barre attempts were made to run, but without success. The weather was so cold that the mine workers' enthusiasm was somewhat dampened. Had the day been pleasanter the sacrifice of New Year's could have been made with less difficulty.

Does Advance Apply to Differential Also?

In West Virginia the Preston County Coal Operators' Association and the miners of that district have failed to come to an agreement. They are still in controversy as to whether the 15 per cent. advance on yardage and deadwork, provided in the last wage increase, applies to the differential existing between the prices paid for mining wide and narrow work. Not being able to agree they have, by mutual consent, referred the controversy to Dr. Harry A. Garfield, the Federal Fuel Administrator, for arbitration, his decision to be final and binding and retroactive to Nov. 1.

Much tonnage was lost during the holidays by the failure of the Illinois miners to keep their promise to work every day except Christmas and New Year's. In the Central Illinois field, around Springfield, the output on the day after Christmas and the day after New Year's was 30,000 tons less than the daily average. At many mines in this district and in the southern Illinois fields not more than one-third of the men reported on those days for work, and it was two or three days after each holiday before the men were at work in full force.

Miners Make Merry Too Long in Illinois

For the greater part of the year the average daily production in Central Illinois has been 60,000 tons or 1200 carloads. On Dec. 26 the production was only 710 cars and on Jan. 2 it was about the same. The district in which this tonnage reduction occurred extends from Lincoln to Centralia and from Pana to Carlinville. The announcement of the figures comes from the Central Illinois Coal Bureau, which receives reports on one-fourth of the output of the state. There was a similar loss of production in the other districts.

The official report of the recent United Mine Workers' election shows that all the state officials were reëlected. For president, Frank Farrington defeated Frank Hefferly, of Collinsville, by a vote of 28,438 to 24,254. For secretary-treasurer, Walter Nesbit, of Belleville, defeated Edward A. Wieck by 31,365 to 13,991. For vice president Harry Fishwick defeated Dave Stuart by 24,836 to 23,100.

Miner's Best Home Is His Own

The committee appointed by ex-President John P. White, of the United Mine Workers of America, under authority of a resolution adopted by the last international convention to investigate the advisability of establishing a home for superannuated miners and the cost of maintaing it, will report adversely on the project. The committee's report will recommend a pension scheme instead, because under that system the fear of pauperism will be removed.

The committee's opposition to the establishment of a home is based on the grounds that the men of advanced years should be enabled to obtain relief without leaving their families and being separated from their loved ones to become the wards of an institution.

The report will recommend a per capita tax of 25c. a month, to be levied on the 400,000 members of the United Mine Workers during the next five years, and further, the payment after 1923 of a monthly pension of $20 to all miners more than 65 years of age. Miners under 65 years of age who are incapacitated by accident, and have no means of support, will receive a like amount. Under the committee's plan no miner will be eligible until he has been continuously a member of the organization for 10 years and has paid the pension tax for five years.

The committee is composed of William Mitchell, of Iowa; Evan Evans, of Illinois, and John Hutchinson, of Indiana. The investigation of the committee was far-reaching. Visits were made to the Typographical Union's Home at Colorado Springs; Printing Pressmen and Assistants' Home at Rogersville, Tenn., and several homes maintained by fraternal societies and also the homes provided by the Government for old soldiers.

Should Wait for Delayed Cars

Waiting for cars which may not come for hours or may not come at all is trying to the best of men. But today it is a patriotic duty. The soldier has to wait days, even months, for a foe who doesn't come and attack as expected. The miner might well consent to wait a little while for cars which the Government has promised to deliver but cannot get to the mine on schedule time. He *might* wait and before long he *will* wait. Eventually he will be made to realize that it is his duty.

Just now at some mines in Illinois he is unwilling to wait, even though his agreement, made before the war, required him to stay at the mine an hour at starting time if cars were not on hand. The operators at some mines say that men go home if the cars are only a few minutes late. As a result the cars lie idle on the switches until the next day, and a day's output is lost.

Louis Senior, owner of the Branch mine, near Belleville, has filed a complaint with the Belleville District Fuel Commission, comprised of Adolph Knobeloch, Victor Gans and E. A. Daley, declaring that four times within the past six weeks the men employed at his mine have refused to go to work because no cars were on the siding at 7:30 a.m. He declares that the men have signed an agreement specifying that, even though no cars are at hand, they will start working at 7:30 a.m. and continue at work until 8:30 a.m.

He asserts that the men have broken this agreement, even when cars were in sight, and in other cases when the cars were being pushed into the siding. The capacity of the mine is 600 tons a day, and that tonnage is lost every time the mine is laid idle. The commission will ask the Government to define its powers to deal with the case. Other operators say they are having the same experience and the aggregate tonnage lost is large.

Will Work Only Under Flag

Some of the mines in Crawford County, Kansas, are manned by Austrians and others by Italians. The companies have found it desirable to group them by nationalities, as their racial antipathies make frequent troubles. The other day 500 Austrians threw down their tools, and the operating company naturally assumed that the men did it to hamper the United States in the successful conduct of the war.

Fred Robertson, a fuel administrator, was called in to get the men back to work. On securing an interpreter he soon found out the cause of the trouble. Over the mines in which the Italians worked an American flag had been erected, and the distinction had made the Austrians jealous. They wouldn't work without flags on the tipples over which their coal was dumped. A rush order was sent for flags, and at last accounts the flags were flying and the Austrians were trying to put out more coal than the Italians.

To Knit Up Pacific Industry

The delegations to the Indianapolis convention from Washington, Montana and Wyoming propose to seek at that meeting permission to form a tristate organization in order that working agreements between mine workers and operators in those three Northwestern States would run for the same period and have similar provisions. The Monarch mine in the Cle Elum field in District No. 10 has made an agreement with its men covering both the hours of labor and the day and contract rates.

The Pacific Coast Coal Co. and District No. 10 have made an agreement for the men engaged in the briquetting plant of the company at Renton, King County, near Seattle. The agreement provides for an eight-hour day and for a wage increase running from 40c. to $1.27 per day. The press operator, the blacksmith and the machinist will receive $5; the feed operator, $4.50; the press-floor operator, the powdered coal operator, the kettleman, the briquet loader, the box-car loader and the coal unloader, $4.25; the dryer operator's helper, $4, and the laborers, $3.75.

Labor Aids the Red Cross

When it comes to helping a cause in which they believe, no one will "shell out" more readily than the mine worker. The Red Cross workers at Pottsville erected their booths at the collieries and approached the miners when they received their semimonthly pay. As a result 5500 of the coal diggers joined the Red Cross.

But, after all, the palm goes to an Illinois mine. For there is still patriotism of the Abraham Lincoln type in Illinois despite all the true stories of alienism we have to record. The members of local union No. 1055, at Cambria, Williamson County, Illinois, agreed to accept the offer of the Carterville & Big Muddy Coal Co. and to work on New Year's Day, donating their services to the Red Cross. The company agreed to turn over to that organization every cent received for the coal, and the Clear-Clinch Co., which jobbed the coal, promised to give its commissions to the same excellent object.

And for the money thus earned every man, woman and child in Cambria was to receive a membership in the Red Cross. The town was to be made a 100-per-cent. Red Cross town. Whatever remained after the membership was filled was to go to the Williamson County Chapter of the Red Cross, for use in purchasing goods for surgical dressings.

Of Course, There is a Strike

Scanning the whole horizon of the United States coal-mining activities, of course, a strike can always be found. The day before New Year's the men of the Superior Coal Co., a small concern in troublous Michigan, went on strike to compel the company to restore Charles Tonnacliffe, a fireman, to the corporation's working force. John Crutchfield, of Saginaw, the president of the Michigan mine workers, supports Tonnacliffe's claim to work. According to J. E. Evans, the general manager, the mine workers quite generally do not, and have petitioned Crutchfield to allow them to continue work without Tonnacliffe. They are said even to threaten to leave the union if the president of the organization proves obdurate in his support of Tonnacliffe. Work resumed Jan. 4 pending adjustment of difficulties. Michigan miners have a paramount obligation to work steadily. By working they reduce the need for transportation immensely. Though the mines are small, strategically they are of great importance.

EDITORIALS

What "Sufficient Interest" Really Means

THE Annual Report of the Federal Trade Commission tries to clear that board of the crime of having, in the report of June 20, correctly outlined the facts about the anthracite situation. The Federal Trade Commission stands convicted of having told the truth, the whole truth and nothing but the truth. No gainsaying now can turn that truth into a falsehood.

"Whatever measure of success," said the report of June 20, "has marked the efforts of the commission with regard to anthracite coal has been largely because the car supply has been adequate by reason of the close corporate relation between rail transportation and anthracite production. Quite the contrary condition exists with relation to bituminous and rail transportation"—apparently meaning transportation of bituminous coal by rail—"and with relation to water transportation as to both kinds of coal."

Of course, the commission received a call for its unfortunate frankness. Men have been returned to Congress for no less a service than denying this self-evident fact. So in the annual report of the commission, an attempt is made to explain away the first statement, this extraordinary language being used in that ill-adjudged endeavor:

"This statement of the commission seems to have been open to a construction that a close relation between coal-mining companies and transportation agencies is desirable. On the contrary, the commission was seeking simply to show that, if *sufficient interest* is present, transportation facilities in existence can be made adequately to care for stimulated production. The speedy movement of coal by interested transportation companies was pointed out to emphasize by contrast the misuse of rolling stock by other transportation companies.

"The evils of a community of interest between coal-producing and coal-transporting companies are fully recognized by the commission. Directly as to anthracite, this is shown by the abnormal freight rates which have been secured by interested transportation companies for the movement of such coal. Instead of being in the public interest, this community of corporate interest, therefore, makes for unduly high prices of coal to the public and has in it the making of further monopoly."

We have italicized "sufficient interest" because it is the gist of the sentence. What is "sufficient interest" but sufficient profit. There was profit in using coal cars for coal, therefore they were used for that purpose in the anthracite region. The commission lauds sufficient interest at the opening of its statement and laments it at its close.

However, it is a fact that the fullness of car supply in the anthracite region is not due solely to the monopolization of coal cars in coal-transport service. It is a fact that the number of cars in the anthracite region is equal to the needs of the busiest season. That has never been true of the bituminous region. The railroads hauling anthracite have had "sufficient interest"—that is, sufficient profit—not only to keep cars in coal service but to buy and maintain them in condition for that purpose.

They have also had a more even demand for transportation throughout the year. This has made it reasonable to buy cars to supply the peak load with satisfaction. No one can afford to buy equipment to supply a peak load of short duration or uncertain occurrence. It has been by the control that the commission deplores, or pretends to deplore, that the distribution of demand for coal has been secured. The Federal Trade Commission will do well to put the facts before the public without fear of consequences and without sign of hedging.

Given the prospect of profit, men will invest in coal cars. Given the prospect of greater profit in coal transport than in other transport, men will transport coal and let other merchandise rest. Few invest willingly in unprofitable enterprises, the commissioners themselves not excluded. Few do what pays them less when they can do something that will pay them more.

That is just why men have been leaving the mines for the munition factories. The latter paid more for their labor and so commanded their services. It doesn't do to work at an unprofitable trade, because as a rule the rate of pay is a rough measure of the desire of the public for a certain type of service.

There is a class of demagogues who condemn men for seeking a profit, and say no man should be actuated by such mean motives. Suppose some people do operate at a loss, willingly or by compulsion, the same demagogues declare that a large profit is being made, for surely, they add, no one will work at a loss. They convict themselves. They say that everyone ought to do what they also say there is no one who will do. They preach civic virtue and deny that the possession of civic virtue is attainable. Why take so contradictory a course?

"The Very Bulwark of Coal Mining"

SPEAKING at a dinner of the American Institute of Mining Engineers, New York Section, a metal-mining engineer and manager, Arthur Thacher, said: "I can look back on 40 years of mining experience during which I have seen wages of American miners rise from 65c. a day for 12 hours' work to $4 and $6 a day; yet our cost per ton is less now than when we paid 65c. The increased use of machinery does not account for the whole increase in efficiency, because the same kind of shoveling and pickwork is still employed. We are working more intelligently; our men are not complaining of extra work, for the performance of it is made easier by the intelligence used in its performance."

That is an interesting statement, and it is true. Compare it with coal mining, which has faced continuously

increasing costs per ton because of increasing prices of piecework. When the European war commenced the charges for haulage, ventilation, drainage, hoisting, dumping and railroad-car loading in most cases had gone down rather than up. In 1914 most of these operations involved manifold more units of duty than they did years ago, and wages also had risen, but as we were working with intelligence and were doing the work on a day-wage basis, we were meeting, and in some cases, more than meeting, these larger burdens by our greater efficiency.

Nor were the men working any harder than before. In many instances they were hardly working at all. The motorman rarely left his seat. The coupler almost never pushed a car. The dumper merely pulled a lever. The trimmer handled a car dropper instead of barring the railroad cars. The pumper watched a pump; he did not as in years past work the crooked handle of a pitcher pump. Nor was ventilation secured by a hand fan or a furnace, which latter needed the constant attention of the stoker and was good for only a small section of a mine or for a restricted coal working.

And so the daymen worked less and did more, but the piecework price mounted even higher and higher. Some one attacking the proposal to replace piecework by day-work at the mines said in connection with some remarks at the recent meeting of the Coal Mining Institute of America that piecework was "the very bulwark of coal mining," and when he said that he spoke well. It is the bulwark, the trenchwork of coal mining, the defense of the weak and the craven in the industry.

But some day we hope to go "over the top." We are going to cease digging deeper and deeper and are going forward in coal mining. We are going to shelter ourselves no longer behind bulwarks. We propose to establish a new industry, but that will not be done as long as we retain the piecework system.

When the profit of progress goes to the progressive then will progressing be possible. As it is now, what little progress we have in actual mining profits only the man on whom it is thrust; and why thrust progress and profit on anyone who will not even *help* to pay for it?

True, if we put our mines on a piecework basis throughout, replacing what day rates we have by tonnage rates, we might, and probably would, save a large amount of money *at first*. We would speed up our workers, but there is a limit to that speeding. There is a point beyond which the workman, however much speeded, encouraged, dogged or threatened, cannot go. That goal once reached there is no future progress possible. The utmost is then attained; but, given new machinery and new methods, marvelous progress can be made. If, however, the man who works on the piecework basis is to get all the advantages of those helps, methods and machinery, who is going to bestir himself to supply them? Who will stay up nights to imagine and develop them? Who will put money into the coal business to secure them? Who, to make a more correct statement, will deliberately throw money away to have the workman profit by them?

It will be said that a new development will justify a new piecework scale. Those who have tried to get such new scales will please bear witness to their troubles. It is an almost hopeless task to secure such a revised contract. The scales as written do not provide for any revision of rates when conditions are revised.

And besides, the change is not always revolutionary and the need for a new scale is not clearly indicated. But where it is quite revolutionary it may be at first an advance of doubtful merit, as is usual in all progress. Would some one make a scale for flying per mile when the Wrights were first trying out their airplanes at Kitty Hawk? And if a scale had been made, what a damper would have been set on the progress of aviation, provided there was a union capable of preventing that scale from being lowered and strong enough even to raise it biennially, annually and, on occasion, seasonally also!

Paying the Price

AS a nation we have dallied carelessly with the "good roads movement." Now we are paying the price. It is proposed to send trains of loaded army motor trucks, under their own power, from Detroit to the seaboard. The first fleet was eight days in reaching Pittsburgh. Less than one-half this time would have been consumed if there had been even a fairly good road to travel.

Much freight could now be diverted from the railroads to the highways if good ones existed, but our extreme need finds us with only one-tenth of our 2,500,000 miles of public roads available for heavy motor-truck traffic.

The American people will have learned by the time the war is over that there are national prophets in this land whose advice is deadly. Such are those who told us that should war come, the American people would rise overnight, and in their might would smother all enemies. We have been rising since last May and haven't got up on our feet yet. Let us not forget the price we are paying for our credulity.

Danger and Discipline

THE fact that the fatality rate of the coal mines has outstripped the tonnage rate in the past year is a matter for careful thought on the part of both operator and mine worker. There is little question but what greater discipline would result in reducing that fatality rate. The soldiers from Australia, we are told, did not at first take kindly to discipline. They opposed the strictness and precision of militarism till they found that it was badly needed in the presence of danger.

Mines are, in a modified way, like battlefields. They are places of real or potential danger, and discipline is necessary. Where there are unions, there is no reason why it should not be union discipline. In some mines the pit committee strictly prevents crowding around the cage and pushing around the man trip, and other breaches of the mine law. It is proud to act as an instrument of beneficence.

But whatever the condition of the mine—unionized or ununionized—there must be discipline for safety. Discipline after all is coöperation as opposed to self-interest.

The discipline of the mine is different from the discipline of the battlefield as mines are different from battlefields. But discipline there must always be. Let us make up our minds to that before the danger overtakes us.

LEGAL DEPARTMENT

RISK OF FALLING ROOF NOT ASSUMED—A miner directed by his foreman to load out slate that had fallen from a mine roof was entitled to rely upon the foreman's assurance to him that the roof was then safe, without testing it for himself. (Kentucky Court of Appeals, Spencer vs. Consolidation Coal Co., 197 Southwestern Reporter, 1069.)

CONTRIBUTORY NEGLIGENCE OF MINER—There can be no recovery for accidental killing of a miner by fall of coal above a point where he was cutting a groove along the side of an entry preparatory to the installation of a telephone wire, on it appearing that he was warned against a loose condition of the overhead coal, and knew that he should not undertake to cut a groove there before removal of the overhanging coal, which required the assistance of several men. (United States Circuit Court of Appeals, Fourth Circuit; Dodd vs. Pocahontas Consolidated Collieries Co., 244 Federal Reporter, 151.)

RISK OF FALLING SLATE ASSUMED—A coal operator is not liable for injury sustained by a miner through falling slate, on a theory of the company's negligent failure to provide him with a reasonably safe working place, where it was part of his duties to take down slate for his own protection after firing shots loosening it. Nor is the employer to be held liable for such accident on a theory of bad ventilation of the mine preventing the injured man from making a proper inspection of the roof to determine the necessity for removing the slate, where the miner returned to his working place after firing shots without waiting for the foreman to close a trapdoor, which the miner knew would cause the accumulated smoke to disappear. (Kentucky Court of Appeals, Gregg vs. Stonega Coke and Coal Co., 198 Southwestern Reporter, 5.)

NON-ENGLISH SPEAKING EMPLOYEES—Within the rule of law that an employer is liable for injury to one employee caused by negligence of another, when the latter had previously shown himself to be so incompetent as to show that the employer was negligent in retaining him, an employee is not to be deemed to be incompetent merely because he is not familiar with the English language. So where a particular accident resulting in injury to one employee is found to have been caused by some negligent act of another not directly dependent upon the inability of the latter to understand English, as where machinery is started while another employee is known to be in a perilous position, the employer is not liable, in the absence of proof that the negligent worker's incompetence was previously known. (New York Court of Appeals' Barber vs. Smeallie, 117 Northeastern Reporter, 611.)

INSPECTION OF GASEOUS MINES—A statute in force in Utah reads: "In all mines known to generate explosive gases, the mine foreman, or firebosses, shall make a careful examination every morning of all working places and travelingways, and all other places which might endanger the safety of the workmen, within three hours prior to the time at which the workmen shall enter the mine. Such examination shall be made with the safety lamp." In affirming judgment against a coal operator, on the theory of a violation, of the provisions of this law it is held that if any explosive gases are found in a mine the statutory inspection must be made, although experts might regard the quantity as not being dangerous. "The language of the statute is positive and direct. . . . 'In all mines known to generate explosive gases' the examination and inspection directed by the statute must be made. A moment's reflection will make clear that the statute was intended to and does apply to all mines where explosive gases are known to exist, regardless of the quantity thereof. The Legislature thus withdrew the question respecting the quantity of gases, or whether the quantity was safe or otherwise, from the judgment of all classes, whether experts or non-experts, and imposed the duty of examination and inspection in all mines where explosive gases in any quantity are known to exist. . . . The Legislature has thus adopted the safe course." (Utah Supreme Court, Eleganti vs. Standard Coal Co., 168 Pacific Reporter, 266.)

SUIT FOR EMPLOYEE'S DEATH—"FELLOW SERVANTS" IN MINING—Where a miner was fatally injured in an accident for which the employing mining company was liable, leaving no widow or children, his mother was entitled to sue the company for damages on the father refusing to do so as administrator, although the right to sue was primarily in him. Decedent, who was injured while engaged in operating a cut of loaded cars on an incline through negligence of another employee operating a separate cut of cars, was not a "fellow servant" of the latter, within the rule of law that an employer is not liable for injury to one employee through unanticipatable negligence of a fellow servant of the injured man. Neither of the employees in this case, while operating a separate cut of cars, was in any way associated with the other, or in a position to see or to know what the other was doing, or how he was performing his duty. (Kentucky Court of Appeals, Harris vs. Rex Coal Co., 197 Southwestern Reporter, 1075).

ASPECTS OF MINING LEASES—A coal-mining lease contained the provision: "If at any time during the existence of this lease the lessee, his assigns, or successors, shall cease for the period of three months to operate the mines in the manner usual and herein contemplated, then such failure shall, *ipso facto*, work a forfeiture of this lease, and thereupon all improvements placed upon said property shall become the property of the lessor, *unless the delay is unavoidable and caused by circumstances beyond the control of the lessee.*" In a suit to forfeit the lease, it is held that a strike of the lessee's employees and a slight landslide upon the rails of the lessee's railroad, which was removed within a few days, did not excuse failure to operate. And the fact that the lessor gave notice that it would demand a forfeiture if the contract should not be fulfilled on the part of the lessee did not give the lessee any added period during which nonperformance would not work a forfeiture. One operating a mine under contract with a lessee thereof is not a necessary party to a suit by the lessor to forfeit the lease. (Virginia Supreme Court of Appeals, Matoaka Coal Corporation vs. Clinch Valley Mining Corporation, 93 Southeastern Reporter, 799.)

ADOPTING WORKMEN'S COMPENSATION IN IOWA—Under the specific provisions of the Iowa Workmen's Compensation Act, when an employer elects to reject the provisions of the law, or when he elects to adopt them after giving notice of such rejection, the election does not become binding upon his employees until and unless notice is not only filed with the state industrial commissioner, but is also posted conspicuously at the place where the employment is carried on. Hence, where a coal-mining company filed notice with the commissioner and posted it at its mine, showing that the provisions of the act were rejected, and, on determining to rescind this action, notice was filed with the commissioner, but was not posted at the mine, there was no sufficient election to come under the law, and an injured man was at liberty to bring an ordinary suit at law for damages. His right in this respect is not affected by the facts that the notice rejecting the act was torn down at the mine, and that there was general understanding among the employees that the company had accepted the statute, nor by the fact that the injured man could not talk or read English. (Iowa Supreme Court, Paucher vs. Enterprise Coal Mining Co., 1035.)

MINERS! Kiddies like yours are waiting in long lines for hours in hope of getting your coal. Some of them don't get any but go home to a cold stove.

Loading the coal into sacks in the yard

Taking the coal home on a wagon

DO ALL YOU CAN to help them get it. "Inasmuch as ye have done unto one of the least of these, my brethren, ye have done it unto Me."

Discussion by Readers

Women in Industry

Letter No. 2—I did not see the article referred to by C. McManiman, in his letter discussing the employment of women to fill the places of men who have answered the draft call. In his letter, which appears in *Coal Age*, Dec. 22, p. 1067, Mr. McManiman appears to object to women being employed as slate pickers, loaders, locomotive runners, etc., but thinks they could fill the positions of checkweighers, warehouse keepers and distributors of explosives.

In my opinion present conditions do not demand the employment of women in or about the mines. They are doing excellent work for the Red Cross, the Y. M. C. A. and as members of the War Council. In a few instances, women appear to excel the men in the work they have undertaken to help win the war.

The positions relating to coal mining that women might fill would, I believe, have to be confined merely to clerical work. The actual performance of the duties involved in the positions just mentioned, however, require considerably more than clerical ability. The weighing of coal, for example, at the majority of mines, requires much executive and physical ability.

A warehouse keeper should not only be a conservative person but possessed of a wide mechanical knowledge of the requirements of the entire plant. In regard to a distributor of explosives, I would not think of placing a woman in that position, which requires not only strength to handle the work, but experience along particular lines with which women are not commonly familiar.

A Look Into the Future

While conditions at present do not appear to require that women engage in mining work, it must be acknowledged that such a possibility exists in respect to the future. Before that is done, however, the men remaining at home must be willing to make whatever sacrifices are required, such as temporarily closing nonessential industries, and devoting their energies to the mining of coal and other work on which the success of the war depends.

Suggestions have appeared, from time to time, in regard to what industries are unessential and could be dispensed with, for a time, without loss to the community. I will not attempt to enumerate them. I believe, however, that when the emergency arises, the country will be equal to the tasks before it. The work already done shows a high degree of efficiency in many respects.

Speaking of the need of workers to supply the places of men called to the front, let me suggest that there are a large number of boys under the age of 16. These boys are more fitted than women for all classes of mine work. In fact, it has not been so long since they were permitted to work in and about the mines. At present, the new Federal child-labor law makes it unconstitutional for boys under the age of 16 to be employed in any industry, the product of which is shipped into another state.

Although I worked in the mines when I was 12 years old, I realize that the law to which I have referred was enacted for the protection of the boys and the proper development of the human race. It was a good law and greatly needed. In the present crisis, however, it will not be strange if conditions soon require that this law be set aside, since boys of that age can better be spared than women, and their employment in these positions will not be so detrimental to the human race.

It is my belief and conviction that none of our good laws, designed for the betterment of the people in times of peace, will be allowed to overshadow the patriotic necessity that arises in time of war. When the time comes and the need is present, I believe that the President will permit no red tape to interfere with the immediate adoption of what is required to accomplish the end for which we are all striving. It is hardly necessary to remember, here, that the laws of most coal-producing states forbid the employment of women in the mines.

Thomas, W. Va.

Miners and the War

Letter No. 5—I was greatly interested in reading the letters regarding miners not being as anxious to do their utmost to produce, at this time, the largest possible quantity of coal, which has been urged as a great factor in winning the war.

I must admit that miners, as a class, do not care to be driven like mules, or to be whipped into line any more than workers in other industries. As a class, miners are stubborn but, on the whole, I do not know that this feature of their make-up is any more prominent than the same trait in coal operators. It is this characteristic obstinacy that has frequently widened the gap between employer and employed, in all industries.

Organization of Miners and Its Effect

It must be admitted that the lack of coöperation often manifest between miners and the operators who employ them has led the former to organize for their own protection. If greater efficiency is to be realized in the mining of coal, and the operation of mines, it is clear that both parties must work in harmony. An instance occurred a few mornings ago that illustrates the importance of this fact.

At a certain mine, it happened that morning that the miners' train, which daily carries them to their work, was three minutes behind the appointed time. Taking advantage of this slight delay, the miners, with little thought of coöperation and working in harmony with their employer, refused to go to work and the mine was forced to stand idle that day.

The remark is often made that miners have employed such assertive tactics ever since they were organized. But, while this may be true it is certain that remarks of that kind will not tend to bring the miners and operators together. What is needed is less wilfulness and more kindliness for each other, expressed both in words and acts.

There is ample opportunity and every inducement, at present, for miners to produce the greatest possible output of coal and to work every day that the mine is running. Instead of this, however, we often find the miner indifferent to the present rigid demand for coal. He is prone to regulate his workdays in accordance with his own individual needs, rather than from any feeling of patriotism.

Miners and the Penalty Clause

The average miner regards the "penalty clause," for example, as an attempt to drive him to work. Anyone who has this idea or assumes such an attitude, in the present war crisis, could not have read the excellent Foreword, entitled "Is This My Boy?" which appeared in *Coal Age*, Nov. 24, or thought very much in that direction. As a miner, I am frank to say that I favor the penalty clause, as long as it is used against the right party and in a way that no innocent person will suffer. It is true that at present miners should earn good wages, owing to the increased price of mining. At the same time, there are other conditions that affect the earnings of the miner. Speaking for myself, I feel safe in saying that I never had a less Christmas pay, in the last eight years, than that which I received in my envelope on the 24th of last month.

One has not far to look for the reason for this shortage. It was not my own fault, neither did I find that I had not been credited with every ounce of coal mined. Yet, my pay fell below a 50 per cent. rating. Looking for the cause, I found that I had been obliged to lose three and one-half days, owing to my coal not being cut. Three more days were lost when the mine was not working, probably because there were no flats.

Taking these things into account, I feel that the lack of tonnage in coal production, so generally ascribed to the failure of miners to work regularly in their places, cannot be placed to their charge. This shortage of output should not occur, under present conditions when the country is needing more coal than ever before.

In closing, I want to recommend that less be said about the inefficiency of miners, and a more earnest effort be made to place the blame where it rightly belongs. Let the railroads and the mine managements each assume their share of the blame. When the real source of the trouble is found and understood, there will be more hope of overcoming the difficulty and producing all the coal that the country requires.

W. H. Luxton,
Linton, Ind. Miner.

Shotfiring re Explosion

Letter No. 1—In connection with the claim of John Verner, former state mine inspector in Iowa, that a mine atmosphere laden with powder smoke contains so much carbon dioxide that it is "incapable of promoting or maintaining an explosion" and "will have a decided quenching effect on the flame of an explosion that is already under way," *Coal Age*, Nov. 3, p. 774, kindly allow me to cite an instance bearing on this point.

It became my duty, a short time since (Dec. 10, 1917) to enter a mine at the head of a rescue party, for the purpose of rescuing, if possible, two unfortunate shotlighters who had been caught in an explosion of powder smoke intensified and propagated by dust.

Our party arrived on the scene and entered the mine three hours after the explosion had occurred. Attempts at rescue had been made previous to our reaching the place, but these had proved unsuccessful, owing to the men being quickly overcome by the afterdamp, which the force of the explosion had driven back into the old workings on the right of the main entries. The first rescue party had entered the mine equipped only with their carbide lamps. They had not proceeded a great distance before feeling the effects of the afterdamp and were obliged to return to fresh air. We found them so overcome by the gas as to be unfit for further service.

The explosion had put the fan out of commission and the only means of ventilation remaining was a low stack at the mouth of the return airway. Here a fire was started and maintained, by burning old oil barrels and other wood. Having no helmets or breathing apparatus of any kind and desiring to avoid the experience of the rescuers who had preceded us, we decided to use the Wolf safety lamp, which would enable us to detect either an explosive mixture or blackdamp.

Rescue Work and Conditions Following the Explosion

Thus equipped, we entered the mine and were able to do reasonably quick work, in repairing brattices and hanging curtains at the mouths of those places from which afterdamp was coming. In this manner we proceeded a distance of about 1000 ft. on the main heading and 400 ft. farther on a crossheading turned to the left. At this point, we suddenly came upon the two dead bodies of the shotlighters where it was least expected to find them.

The bodies of the two men showed a few slight bruises, but were practically unburned excepting for a slight singeing of the hair. This work had now consumed 4½ hours, and a few of our party felt a slight sickness but nothing serious. Our good fortune, in this respect, was due to using every precaution.

We adopted the plan of keeping one man from 20 to 40 ft. in advance of the party. The man carried two lamps, one of which he placed on the floor of the entry, and the other he used for testing the condition of the air at the roof. If the bottom lamp burned dimly, we waited for it to brighten or go out.

We hesitated to check our advance sufficiently to seal off the openings on the left entirely, for which there was an insufficient supply of both lumber and canvas. At times, the lamp carried in advance of the party would go out within 15 ft. of them, and it was necessary to replace it with another safety lamp and wait for the air to clear before going farther. In this way, we proceeded from one crosscut to another, until we finally reached the place where the bodies were found.

It was not my fortune to make one of the party who inspected the mine later with a view to determine the cause of the explosion. There was, however, plenty of evidence, which we observed on every hand and which

showed that there had been an effort on the part of the shotlighters to make too high speed in firing the shots. The men worked together, lighting the holes successively, in the same or adjoining places, as rapidly as possible.

My observation has convinced me that the primary cause of this explosion was due to the quick firing of blasts, in places filled with the powder smoke produced by previous shots. Like Gaston Libiez, who writes on this subject, in *Coal Age*, Dec. 15, p. 1030, I am surprised that Mr. Verner should claim that an atmosphere composed of hot air and gases that are largely inflammable will not assist in promoting and maintaining an explosion in a mine.

I hope this matter will be thoroughly discussed in order that we may arrive at a correct understanding, as the long experience of Mr. Verner is worthy of careful consideration.

GAS INSPECTOR.

Worley, Ky.

Illinois and Missouri Coal Fields

Letter No. 1—While I can claim no first-hand knowledge of the Arkansas coal field, yet the inclusion of this field with the Missouri and Iowa fields, as appears in the article of Charles Keyes, *Coal Age*, Nov. 24, p. 886, there seems no reason to doubt. However, I would take vigorous exception to the statement that the western interior province and the eastern interior province were originally one stratigraphic province.

That the Missouri basin was entirely separate from the Illinois basin prior to the deposition of strata to within 25 ft. below No. 2 coal of the Illinois section, there is definite reason for doubting. But, above that level, within the Illinois basin, about 1000 ft. of strata were later deposited, which were entirely separated from and have no connection with the Missouri basin.

LIMITATION OF A POSSIBLE CONNECTING LINK

The possible connection of the Illinois and Missouri basins through southern Calhoun County, Illinois, applies only to strata included in the section extending from about 25 or 30 ft. above No. 2 coal to the same distance below that seam, especially in the occurrence of the clays at the Cheltenham fireclay horizon at Golden Eagle and in the Cheltenham district of St. Louis. The continuity of the Illinois No. 2 coal in Missouri and its identification with one of the Missouri coals, certainly, has not been definitely established, although there seems to be some evidence that the Bevier coal of Missouri is correlated with the Murphysboro or No. 2 coal of Illinois.

The similarity between the Illinois and Missouri sections, and the possibility of the continuity of the measures in these two basins, however, ceases probably a short distance above No. 2 coal and, certainly, before No. 6 coal is reached. The latter seam known as No. 6 coal outcrops in Illinois through eastern Jersey, Greene and Scott Counties, about 30 miles from the Missouri field. There is no evidence to show that it ever continued across the gap, and there is no coal, in the Missouri section that will permit a definite comparison.

The Illinois coal measures, lying above No. 6 or the Herrin coal, lie within the outcrop of this coal around the basin, which makes the possibility of their original connection with strata in the Missouri basin still more remote. There is positively no route by which the shales and limestones of the Missouri section can be traced into Illinois.

In the attempt to correlate the Missouri section with the Illinois section on the basis of lithologic sequence, a most unusual section was given by Mr. Keyes, on page 887 of his article, as representing the Illinois succession of rocks. The following are the sections given:

	Missouri		Illinois	
Missourian Series	Atchison shales	500	Shales	235
	Forbes limestone	30	Effingham limestones	8
	Platte shales	200	Shales	200
	Plattsmouth limestone	50	Martinville limestones	25
	Lawrence shales	300	Shales	100
	Stanton limestones	20	Livingston limestones	20
	Parkville shales	100	Shales	75
	Iola limestones	30	Absent	...
	Thayer shales	100	Shales	75
	Bethany limestones	50	Shoal limestones	7
Des Moines Series	Marais des C. shales	300	Shales	35
	Henrietta limestones	100	Mazon limestones	100
	Cherokee shales	250	Shales	200
Arkansan Series	Absent		Absent	

Kindly allow me to submit the following section, based upon stratigraphic studies of the State Geological Survey, which is more nearly representative of the conditions in Illinois:

McLeansboro	? Shales	100-150
	? Limestone (Effingham?)	8
	? Shales and sandstones	200?
	New Haven limestone	25
	Shales and sandstones	100–150
	Shoal Creek limestone	7
	Shale and some coal	100
	Carlinville limestone	7
	Shale, some limestone, and coal	200–300
	Limestone caprock No. 6 coal	6
Carbondale	Shales with No. 6 coal at top and No. 2 coal at base	300
Pottsville	Shales and sandstones	1,000

The Pottsville in the above section is represented, in Missouri, by strata lying rather below the middle of the Cherokee shales. The Carbondale formation is represented, in Missouri, by strata beginning about the middle of the Cherokee shales (at the horizon of the Bevier coal) and extending about to the top of the Des Moines series. The McLeansboro formation begins at about the same horizon as the Missourian series. Between the Missourian series and the Des Moines series, in Missouri, and the McLeansboro and Carbondale formations, in Illinois, there was probably, locally at least, a period of erosion followed by conspicuous sandstone deposition.

It seems to me that there is no special significance in the possible similarity in sequence, between the McLeansboro formation of Illinois and the Missourian series of Missouri, without paleontologic evidence to substantiate the correlations. At present, there are no data available that will justify the definite correlation of any horizon in the McLeansboro with any stratum or formation in the Missourian series.

GILBERT H. CADY,

Urbana, Ill. Illinois State Geological Survey.

The Zone Postal Law

Kindly permit me to refer to the appeal made in the advertisement of the American Authors' League of America, Inc., which appeared on the second page of the advertising columns of *Coal Age*, Dec. 29, and presented some strong arguments in favor of the repeal of the Postal-Zone Enactment, recently passed by Congress, to take effect July 1, 1918.

Owing to its bearing on circulation, there may be some hesitancy in permitting the discussion of this ques-

tion in the columns open to readers, were it not for the fact that the subject is one of even more vital interest to subscribers than to the publishers themselves. The former must eventually bear the burden of the increased expense created by this law.

As stated in the advertisement to which I have referred, this increase of expense will range from 50 to 900 per cent., according to the distance of the subscriber from the office of publication. For that reason, allow me to suggest that this injudicious legislation should have all the publicity possible.

In their hour of greatest need, the American people cannot afford to grope in the dark nor to Rip-Van-Winkleize themselves in an intellectual slumber, in respect to anything that menaces the free and unrestricted distribution of ideas throughout the length and breadth of the land.

Patriotic Mission of the Country's Press

One point that seems to me has not been thoroughly emphasized in the Authors' League advertisement is the patriotic service that is being rendered by the country's periodicals. Surely, we cannot undervalue their mission. It is the press more than any other instrument that is responsible for the patriotic harmony of our people throughout the length and breadth of the land.

The daily, weekly and monthly publications that are now distributed broadcast from sea to sea serve to vitalize and unify public opinion. Only by this means can that gospel of justice and truth, which is provoking in Prussianism a growing passion of hatred for us and our principles, be disseminated and this country and the world made to realize that the Emperor of Germany is fighting a world democracy that threatens his own autocratic rule.

In view of these facts, let Congress reflect and ask itself what per cent. of the American people who are now reading the best of these periodicals will be able to continue their subscriptions, after the excess carrier charges prescribed by the Zone-Postal Amendment have gone into effect. Then, what will be the result of this limitation in the dissemination of patriotic literature throughout the country, on the average citizen's patriotic ardor.

Effect of Obstructing the Avenues of News

It goes without saying that the first effect will be to create a widespread feeling that the law is unjust—Prussianizing the press which has been and is the great highway for the dissemination of the principles of democracy.

Scorning to pay this tax draft, which the advertisement of the Authors' League rightly styles "a tax on ideas," through the Postoffice Department that was never designed for any other purpose than to serve the people, the effect will be a waning interest in the loyal support of all measures that should, instead, be kept at white heat until victory is ours.

Finally, the injustice of this act is most apparent from the discrimination it makes between dwellers within the zone of publication and those further removed who must pay the excess demanded, simply because their occupation does not permit them to dwell in closer proximity to the great centers of thought. How many coal-mining officials and miners, let me ask, would be able to pursue their occupation in the Flatiron Building, in New York City? Is it justice to demand that, because of their more distant location, American citizens are subject to a tax on ideas that should be free as the expression of thought?

As stated previously, we must court no chance that portends calamity. Hence, as one of the great army of subscribers, I join in the appeal of publishers, whose interests are even less at stake than our own, to ask for the repeal of this law in the interest of patriotism and justice to all people. I heartily indorse the suggestion of writing our several congressmen soliciting their cooperation in securing the repeal of an unwise law that should never have been enacted. W. H. Noone.

Thomas, W. Va.

Test of a Man's Capability

Letter No. 4—I was greatly interested in the way John Rose, former district mine inspector in Tennessee, replied to a previous letter by "Mule Driver," *Coal Age*, Nov. 17, p. 860. I presume that both are good men, even though one of them appears to be a mule driver.

However, should these two men go to the stockyards, for the purpose of selecting mules for use in a mine, Mr. Mule Driver would probably show his superiority to our friend the inspector, by selecting mules having long ears and other characteristics that adapt them to mine work.

Capability Determined by a Man's Training

The driver's experience has taught him that the tips of the long ears of a mule, brushing the roof and timbers in a mine, will cause the animal to "duck," as the boys say, and avoid many a hard knock that the short-eared fellow will get, until he has learned the road.

Now, this is no reflection on the capability of the inspector, whose strong points lie in another line, as foreign to the mule driver as his knowledge of the mule is to the inspector. A man's capability must be examined in the line of his training. It goes without saying that a man that has worked his way up from the rank and file to hold a technical position in any industry has accomplished that end by study and observation, through years of toil that have made his experience valuable.

If I am not mistaken, my friend, Mr. Rose, belongs to a class that has arisen from coupling cars, at the age of 10 or 12 years, to the position of mine foreman at 40 and mine inspector a few years later. As Mr. Rose has pointed out in his letter, the capability of a man is not to be determined by the fact that he holds a certificate of competency to act as mine foreman, or because he can pick out a mule driver among the men who come to him for work.

Selection of Men For Particular Duties

The selection of men for the duties that they are competent to perform is most successfully performed, in my opinion, by submitting to them a previously arranged set of questions, for which a blank form may be prepared. The experienced foreman or superintendent can then decide, from an examination of the answers given by the man to these questions, what duties he is capable of performing.

As mine foreman, I have hired mule drivers with big feet, and I may not be credited with telling the truth when I say that they could run, yes, and stop a trip and save a mule, as they were by long training fully acquainted with that trick.

Among those who apply for work in mines are a style of "hangers on." Certainly, their Piccadilly collars and tan shoes do not recommend them for the work underground, but there is something besides that stamps them as being of a different kind from the man who plainly appears to have inherited capability from a child. In hiring men, the foreman must have such as insight into a man's nature that will reveal his true character.

Let me say, here, that a man's knowledge of mining is determined by his practical experience and greatly broadened by his habit of reading mining books and papers. It is my belief that a man who has never read much on mining or studied its principles is not equipped for a position of responsibilty underground—he is not the man for the job.

From an experience of 45 years in coal mines, I must admit that I knew little about capability, until ideas and methods were unfolded to me through the reading of *Mines and Minerals*, *The Colliery Guardian*, and last and towering above them all, *Coal Age*. My advice to men who desire to be capable, in the true sense of the word, is to read and study while they work.

R. W. LIGHTBURN,
West Leisenring, Penn. Mine Foreman.

Blacklisting To Prevent Accident

Letter No. 5—Referring to the claim of James T. Reynolds, *Coal Age*, Dec. 15, p. 1028, that "the most effectual means to obtain the desired safety in mines is the blacklisting of unsafe miners, through the hearty coöperation of all coal operators," allow me to ask, How do we discover an unsafe miner?

Most mining men will admit that, in the majority of cases, the unsafe miner is only discovered after he has been injured or killed as a result of his own ignorance, carelessness or reckless disregard of danger.

It is the duty of every fireboss and safety inspector to make safe miners. This is often slow work and can only be accomplished by making daily visits to each working place and patiently instructing each workman in regard to what is necessary to make his place safe, and telling him how he can mine his coal with the least danger to himself and others.

Should the fireboss discover danger in a place when making his morning rounds, whether this is due to the presence of gas or the lack of sufficient timbers to support the roof, he must block all entrances to the place with a suitable danger sign, report the danger in his book and notify the foreman, telling him what is needed to make the place safe. If the miner is permitted to do the work required to make his place safe, the fireboss or the safety inspector should oversee the job and not leave the place until he is satisfied that it is safe for work.

In my experience as safety inspector I have found many stubborn cases that require the exercise of tact and good judgment. If a place where a miner is at work needs more timber, I stop the man from working until it is timbered to my satisfaction. I do not allow any cars loaded until the needed timbers are in place. This generally has a good effect, as no miner likes to lose his turn, and he is more careful to keep his place in good order when he knows that the inspector is liable to appear any hour of the day.

When told to set timber a miner will often reply by saying that he will set the needed props as soon as he has finished loading the car he has on hand. Right then is the time for the inspector to act, and I say: "John, I am interested in your safety and welfare. Step over here where it is safe and, as I have time, I will stand the post for you." It is seldom that I have had to do the work, however, as the man naturally resents the idea that he is lazy and proceeds at once to set the timber. Neither is he likely to let the same thing occur again.

Appreciate the Efforts of Your Men

There are a lot of tricks in handling men, and I have found that to show appreciation of a miner's efforts to make his place safe is a big incentive to him to continue so doing. He is glad to know that I recognize that he understands how to protect himself. Where no consideration is given to the daily inspection of every working place in a mine, the men become careless and indifferent to danger.

In mines where the accident rate is on the increase it can generally be concluded that the work of inspection is on the decline. There are, of course, instances where men are killed by the fall of a rock that has been left without sufficient support, by the extraction of the coal after the inspector made his visit.

Now, from this review of the carelessness and neglect of miners to obey instructions and their disregard of danger, it is my belief that there are better methods of preventing accidents from these causes than that of "blacklisting." Coal operators should employ a sufficient number of firebosses and safety inspectors to discover where danger exists in time to avoid the results.

Backbone Needed in Dealing with Offenders

Further, mine officials should have backbone enough to report men who are stubborn and who disobey instructions or violate the mining law, and turn them over to the mine inspector of the district. I find, however, that this is seldom necessary where a man uses tact and common sense in dealing with the men in his charge. In any case I would not go so far as to use the blacklist, which may do an innocent man great injury.

Lack of discipline on the part of mine officials is responsible for much carelessness on the part of miners. In closing, let me urge every safety inspector to do his best to teach the men in his charge the best methods of protecting themselves and making the mines safe for work. After the manner of Admiral Nelson, at the battle of Trafalgar, who is reported to have said to his men, immediately before the battle, "England, today, expects every man to do his duty," let us strive to impress our men with the same spirit of loyalty to duty. By this means, we may hopefully expect to reduce the accident rate in mines.

ROBERT A. MARSHALL,
Farr, Colo. Safety Inspector.

INQUIRIES OF GENERAL INTEREST

Status of the Coal Jobber

Since the issuance of the Government's ruling regulating the selling price of coal and the jobber's commission, that class of dealers has been practically put out of business. The reason for this is found in the fact that coal operators are unwilling to sell their output to the jobber at a less price than that fixed by the Government. The consumer is not able to buy coal as cheaply as the larger dealer, who formerly was able to supply the general trade from his yards, which he kept stocked to meet the demands of his customers.

Under the authority granted by the Government, the Fuel Administration has fixed the price at which coal can be sold in each district, in conformity with the conditions existing relative to the mining and shipping of the product. At the same time, the jobber was allowed to make a profit of 15c. per ton on all coal sold by him. The difficulty arises, however, from the failure of the administrator to specify how this commission was to be paid.

Since the rulings were made, most of the coal operators have established their own sales agency and claim the right to absorb the jobber's commission. Since the arrangement went into effect, jobbers everywhere are receiving requests from their former customers who have always looked to them for their supply of fuel. They explain that they have found it impossible to buy enough coal to keep their power plants in continuous operation. In many cases these large consumers would be willing to pay the jobber's commission of 15c. per ton allowed by the Government, if they could be assured of a regular supply of coal.

Whenever these manufacturers and retail dealers have taken the matter up with the Fuel Administration, at Washington, they have received a reply telling them to refer their wants to the dealers who have supplied them regularly in the past. The outlook in this direction, however, is hopeless unless the jobber can secure his coal from the operators at the Government price less their own commission.

It will readily be seen that this is a situation that should be adjusted by the Fuel Administrator, in such a manner that the channels of trade shall be undisturbed and large dealers and manufacturers be able to obtain their supplies in the quantities required and as needed. The question arises: Has the coal operator the legal right to establish a sales agency and absorb the business of the jobber when he is unable to supply the local demands in cities and towns distant from the mines?

A way out of the difficulty has been suggested that, if legal, would permit the jobber to still continue in his business of supplying coal in large quantities to the manufacturers and dealers in his locality. The suggestion is that the jobber act as purchasing agent for his former customers and others who would get their supply of fuel from him. While many of these manufacturers and small dealers could not afford to hire a regular purchasing agent, they could pay a small commission for his services on a tonnage basis.

If this scheme is within the requirements of the law, a purchasing agent would take no part in the transaction further than to forward the order for coal to the operator and collect his own small commission from the consumer. The operator would ship and bill the coal direct to the consignee, who would pay him for the same at the fixed Government price. In addition, the consumer would pay the purchasing agent, for his services, a small percentage based on the tonnage received. What we desire to know, in this connection, is whether such a proceeding would be legal and within the law.

Grand Rapids, Mich. JOBBER.

The question asked by this correspondent was submitted by *Coal Age* to the United States Fuel Administration, at Washington, D. C., and brought the following response from H. D. Nims, who is connected with the Administration. In answer to the question asked, Mr. Nims writes as follows:

> It would be a violation of the spirit of the President's price-fixing orders to say that consumers could employ agents to purchase coal for them at the Government price. In effect, this would be allowing coal to get to the consumer at a price higher than that fixed by the Government. Our rulings, however, do not expressly prevent one from hiring such an agent on a salary basis, for the purpose of purchasing coal at the Government price; but, certainly, in no way should the operator or jobber who sells the coal receive a part of the agent's salary and thus secure for his coal more than that authorized.

Coal Age has interpreted the meaning of this response to be that there is nothing in the Government ruling to prevent a person acting as purchasing agent for one or more parties who are in the market for coal, provided (and this is important) that no part of the salary or commission paid to the agent for his services shall find its way into the pocket of the coal operator, who would thus be able to secure more for his coal than the price authorized by the Government.

In the authorization by the Government that enables the Fuel Administration to fix a price for the sale of coal there has been no intention to disturb the usual channels of trade, or to detract unnecessarily from any legitimate business. Doctor Garfield, as Fuel Administrator, has proceeded with great caution, and the prices fixed by his board have been made to conform to local conditions as closely as a thorough investigation of those conditions would permit. Clearly, the purpose of fixing the selling price of coal at the mines and elsewhere was for the protection of consumers, and to prevent the charging of extortionate prices by coal operators, owing to the extraordinary demand for this product. Some time will doubtless be required for the new conditions relating to the sale of coal to adjust themselves with equity and fairness to all.

EXAMINATION QUESTIONS

Miscellaneous Questions

(Answered by Request)

Ques.—What form of airway will give the most air with the same power, and why?

Ans.—A circular airway will give a larger quantity of air with the same power than either a square or rectangular airway of the same length. The reason is that the perimeter of a circle is less than that of a square or rectangle having the same area as the circle. The circular airway, therefore, presents a less rubbing surface, for the same length, than either a square or rectangular airway of equal sectional area.

Ques.—Which do you consider should be the larger, the upcast or the downcast, and why?

Ans.—The upcast shaft of a mine should always have a larger sectional area than the downcast shaft, for the reason that the return air current passing up the upcast has a generally larger volume than the intake current entering the mine by the downcast shaft. The larger volume of the upcast current is due to its higher temperature and the presence of gases generated in the mine workings.

Ques.—If you had charge of a mine, and the fan engine suddenly broke down, what would you expect to be the condition of the ventilation, and how would you continue to run the mine the rest of the day?

Ans.—If there is no duplicate engine for operating the fan, the men should be withdrawn from the mine at once, and no attempt should be made to continue to run the mine, until the engine can be repaired and the fan again put in operation. Even then, the mine must be examined by the firebosses and pronounced safe before the men are permitted to enter for work.

Ques.—Which is the more reliable, mechanical or natural ventilation, and why?

Ans.—Mechanical ventilation is always more reliable than natural ventilation, because the latter is subject to atmospheric changes that may completely destroy the ventilation in the mine. For example, natural ventilation depending on the higher temperature of the mine air may be rendered useless when the outside tempera ture approaches closely to that of the mine. Again, natural ventilation depending on the force of surface winds may be rendered useless, or the circulation in the mine changed, by a change in the direction of the wind, or by the dying out of the wind completely.

Ques.—What principles are involved in the construction of a safety lamp that would render one lamp more sensitive, in the detection of gas, than another?

Ans.—The sensitiveness of a safety lamp, in the detection of gas, as far as its construction is concerned, depends on the free entry of the air into the combustion chamber, at a point on a level with or below the lamp flame, so as to avoid conflicting ascending and descending currents within the lamp chimney, which would not only cause the lamp to smoke, but would mix the burnt gases that fill the upper portion of the chimney, with the air entering the combustion chamber and invalidate the test.

Also, if the entry of the air into the combustion chamber of a lamp is restricted the gaseous condition of the air surrounding the flame will be considerably changed and the test will not represent truly the air surrounding the lamp. The unbonneted Davy lamp affords the free access of the outside air to the lamp flame, to a greater extent than is true of any other type of lamp, which makes the Davy lamp more sensitive to gas than any lamp in use.

Ques.—A pair of headings, with the usual crosscuts and rising 1 in 4, is standing full of firedamp. The ventilating pressure is low. Give the various methods which may be used to restore the ventilation.

Ans.—Since these headings are driven to the rise, the gas will have a tendency to work toward the face of both headings, which makes its removal more difficult. The work must be begun by erecting a brattice in the mouth of the intake heading. Starting from the rib opposite the mouth of this heading, the brattice must be extended slowly into the heading, setting one post at a time and giving ample time for the air current passing around the end of the brattice to carry off the gas. All work must be performed on the intake side of the brattice, using safety lamps only and making careful tests to ascertain the progress of the work. In this manner, the brattice must be extended up the intake heading, as far as the last open crosscut.

At this juncture, ample time must be given and every possible means adopted to force the current against the air and gas in the other heading. To accomplish this, it will be necessary to increase the circulation as much as possible and to partially close the end of the brattice by drawing it over to the rib at the outby corner of the crosscut, so as to urge the air into the crosscut, instead of permitting it to return behind the brattice. When the crosscut is found to be taking the air, the brattice can be removed from the intake side and a canvas hung on the main entry so as to deflect the air and cause it to ventilate the two headings. This will give more freedom to the passage of air up the intake heading and force it through the crosscut driving the gas from the return heading.

After clearing the gas from the two headings below the open crosscut, the work of removing the gas accumulated above this crosscut should be commenced by extending a brattice from the outby corner of the last breakthrough, on the intake side. This brattice must be extended slowly toward the face, by setting a single post at a time, in the same manner as before, until all the gas has been removed from the face of the intake heading, after which the same method must be pursued in removing the gas from the face of the return heading. This is the only practicable and safe method of removing the gas filling a pair of rise headings.

COAL AND COKE NEWS

For the Busy Reader

A price of $2.25 has been fixed by the Fuel Administration for run-of-mine lignite at North Dakota mines.

* * *

To insure a steady flow of coal to New England by rail, the Fuel Administration has issued orders to 102 mines to furnish a certain number of cars per day. A total of 500 cars per day is to be forwarded to New England.

* * *

Shortage of coal was given by the Board of Health of Philadelphia as one of the reasons for 73 deaths in that city of pneumonia within a 24-hour period, the highest record of deaths from this disease in one day in the last five years.

* * *

The cold wave brought with it such pressing demands for fuel that an unusually large number of diversions of shipments became necessary to relieve the need for domestic fuel over most of the Middle West, as well as some of the Eastern States.

* * *

Eleven ships, aggregating 65,000 tons, have been turned over to the Fuel Administration by the Shipping Board to be used in transporting coal to New England. These vessels will continue in this service until a reserve sufficient to guarantee an adequate supply for the winter will have been assured to that section of the country.

* * *

A second producing district has been established by the Fuel Administration. The district consists of Boone, Clay, Logan, Mingo, Canawaha, Putnam and Nicholas Counties, of West Virginia, and those parts of the two adjoining counties in Kentucky, which are served by the Norfolk & Western R.R. A. H. Land, of Huntington, W. Va., has been named deputy distributor in charge of the new district.

* * *

By ordering all operators in the Pocahontas fields to give preference to tidewater shipments, the Fuel Administration has made it impossible to ship smokeless coal to Chicago and other Middle Western points. Substitution of coal from near-by fields is being undertaken by the Fuel Administration. Raymond Durham, the fuel administrator for Cook County, Illinois, is in Washington assisting in this substitution.

* * *

Approximately 250,000 tons of anthracite coal consigned to New York City were delayed at New Jersey terminals last week owing to ice in the Hudson and East Rivers, the Fuel Administration announced Jan. 3. In the same announcement, it was stated that no great amount of relief could be furnished through the Pennsylvania tubes and that no material improvement in the rate of delivery of coal is expected until the weather moderates.

* * *

Figures compiled from the returns to the Provost Marshal General show that 225,109 coal miners registered in accordance with the selective service law. The total number called from this industry was 74,109. The total number accepted, however, was 18,710 out of the 600,148 engaged in coal mining. Among the coal miners called 2601 asked to be exempted for industrial reasons. Of these claims 851, or 32.7 per cent., were granted.

* * *

Some idea of the seriousness of the existing coal shortage can be gained from the statement that "one hundred steamships, aggregating more than 1,000,000 tons gross, are being held in New York harbor through lack of coal, and the number is increasing daily." Some of these vessels have been waiting for coal for over a month. When it is remembered that these boats are principally engaged in carrying food supplies and munitions of war to our Allies in Europe the gravity of the situation can be better appreciated.

HARRISBURG, PENN.

The five men entombed by the cave-in at the Marcy Vein of the Barnum Colliery of the Pennsylvania Coal Co., at Pittston, Luzerne County, have been rescued virtually uninjured. Late last Saturday night a squad of rescuers, working through an emergency opening connected with No. 10 shaft, succeeded in learning that the imprisoned men were alive. The force was quickly increased in this particular section, and after several hours' work cleaning away the fallen rock the men were able to crawl out. At the time of the cave the men were able to escape to an old chamber, saving themselves from being crushed to death. One man employed in this section of the mine is still missing, but there is no colliery record that he was at work on the day of the cave-in, although he is absent from his boarding house, the proprietor of which is unable to say whether or not he went to work Saturday morning.

The cave was caused by pillar robbing. The Barnum colliery has been in operation for about 40 years, and all the mining being done in this vein is second mining. About 28 men were engaged in removing pillars, and without much warning the roof began to creep, and an acre or more of the chambers came down completely. Miners in the chambers nearest the roadway had bolted to the main gangway at the first signs of the creep. The air was squeezed from the chambers with such terrific force that the men were picked up like chips and hurled to the ground or against the ribs with terrific force.

The property damage is the most extensive ever suffered by this company which has a dozen big collieries in this section. Ten electric motors are buried by the fall and many of their operators had narrow escapes.

State Mine Inspector Robert Johnson and General Manager J. P. Jennings headed the rescue work. They found their progress shut off by the cave a few hundred feet from the main shaft and from No. 10 shaft, the second entrance to the vein. The ill-fated Twin mine, which contains the bodies of 58 men buried by a similar cave in 1896, is only a short distance away.

* * *

Immediate action by Congress to prohibit the sale of liquor within a five-mile zone from any coal mine or coke plant in the country will be asked as the result of a special conference of coke operators in the Connellsville district on Jan. 3. About 200 operators of the coke industry were present and listened to the address of Warren G. Blauvelt, coke advisor to Fuel Administrator Garfield. It developed that the 40,000 men employed in the coal mines and coke plants of the Connellsville region are working but half time and spending their checks in drinking bouts when they should be at work.

The car shortage and congestion of railroads was also freely discussed, and when Advisor Blauvelt stated that Director General McAdoo had given assurance of a car supply by Apr. 1 sufficient to move continuously the maximum daily output of every plant in the coke region, the consensus of opinion indicated a demand for prohibitory legislation affecting the immediate vicinites of these plants. In order to get a maximum output the operators stated that they must be freed from the endless difficulty with labor, and asked for legislation to remove the drinking factor from the problem. A nominating committee, composed of W. H. Klingerman, operating head of the H. C. Frick Coke Co.; J. M. Jamison and J. H. Hileman, Jr., of Pittsburgh; Charles E. Lenhart, L. L. Willard, William A. Stone and R. M. Fry, all prominent coke men of Uniontown, was named to appoint an executive committee of three, who will regulate the future coke output of the Connellsville region for the duration of the war and as long afterward as the Fuel Administration may deem advisable.

* * *

Differences between the Auditor General and the officers of the State Workmen's Compensation Insurance Fund over the Auditor General's desire to audit the fund to ascertain whether it can be made self-sustaining at the present rate of expenditure for administration is attracting considerable attention in the bituminous region, as many of the soft-coal companies carry their compensation insurance with the state fund.

Attorney General Brown has advised the fund officers that the Auditor General has no power to audit the fund. The Auditor General is studying the law relative to his powers and it is believed that under the act of 1810 he can send Miles A. Dawson, an insurance expert, to the office to audit the books.

Auditor General Snyder states that his only purpose in actuating the proposition to ascertain the condition of the fund was to make it a sure protection of the corporations insured and for the people who benefit by the compensation act, and that in order to carry this purpose into effect the department will insist on a reduction in the payroll and other expenditures and a closer inspection of the management.

The Auditor General laid particular stress upon the fact that he regretted the action of the manager of the board in attempting to prevent an inspection of the records, as he feared it might cause an unjustified impression that would have an adverse effect upon the policies issued by the board or the solvency of the fund, which remain unquestioned.

* * *

Every coal miner using explosives will have to obtain a Federal explosives license before he can buy squibs from his town grocer or small merchant, or get his supply through his licensed mine foreman, according to a ruling by the Bureau of Mines received by Clerk of Courts Wagner of Luzerne County on Jan. 3.

This is an important decision, affecting all miners and vendors, and may retard the production of coal unless the coal companies take steps to facilitate the buying of squibs at the mine openings where the powder is sold. It has been the custom of many miners living in the small mining towns throughout the region to purchase their squibs at their grocer's or other small dealers handling mine supplies.

PENNSYLVANIA

Anthracite

Harwood—The large electric plant of the Lehigh Coal and Navigation Co.'s electric plant suffered heavy damage on Jan. 1, when one of the large turbine's engines in some unknown manner caught fire and was completely burned and put out of service. For a time there were fears that the fire might spread to adjoining equipment in the plant, but through hard work on the part of workmen and electricians the blaze was confined to the one engine. The plant furnishes power to a number of coal companies in the Lehigh region.

Shenandoah—While five men were tightening straps on a heavy pressure steam pipe at the McTurk Colliery's inside stable on Jan. 2, it burst, flooding the stable with steam. The men escaped with slight burns, but seven mules were killed and eight others were so severely burned that they are likely to die. The loss is $5000.

Reading—The Reading Coal and Iron Co. shipped but 881 cars on Jan. 4, which is about half the normal output. It is said that the breakers are filled with coal, but that it was simply impossible to handle it, due to the extreme low temperature. Never before has it been necessary to cut down the tonnage of freight and coalings for so long a period. Notwithstanding the modern locomotives that are now employed, there have been instances when they have been frozen up solidly and it was necessary to draw fires.

Wilkes-Barre—The Wilkes-Barre chamber of commerce recently decided to give its support to the movement to utilize waste mine gas for commercial and domestic purposes as a means of saving coal. The question has been before the chamber since the time Governor Brumbaugh called men from various towns and cities to consider the question. The chamber here has decided to do all in its power to find a satisfactory way of using the great amount of waste gas.

Duryea—Fire completely destroyed the William A. Breaker of the Lehigh Valley Coal Co. on Jan. 3, with a loss estimated at about $200,000. The boiler house and all other buildings were saved, largely by the efforts of the fire departments of three towns, which were called in.

General Manager Chase has stated that the 1200 tons a day produced at this colliery would not be interrupted and the 500 men employed would not be thrown out of work. Arrangements have been made to send the coal run through the William A. Breaker to the Stevens, Coxey and Austin breakers. The men who would be thrown out of work by the destruction of the breaker have been given positions at other collieries. The officials of the company say that the fire was of accidental origin.

Jeddo—Plans are being drawn for the erection of a washery at No. 4 colliery of the G. B. Markle Coal Co. The banks of that place will be prepared for market just as soon as the new plant is complete and will add greatly to the tonnage of the company. Operations of this company on the North side have been hampered during the week as a result of the severe weather freezing springs and streams. The water supply has been at a minimum and it is said that unless relief is gained in a very short time the water for the collieries will have to be hauled.

Bituminous

Uniontown—On railroad sidings between Ache Junction and Brownsville, on the Coal Lick Run branch of the Pennsylvania R.R., and between Martin and Brownsville on the same branch, there are 1200 freight cars tied up. Many of the cars are loaded with coal. As a result of the congestion many mines in this region have shut down and coal miners are leaving to seek work in other fields.

The Vesta Coal and Coke Co. has awarded contract for the erection of 45 new dwelling houses, to be constructed at the Vesta No. 6 works, near West Brownsville. The contract price is $130,000. The homes are to be modern in every respect. It is expected to have the houses completed within three months.

Midland—In order to keep its work in continued operation, the Crucible Steel Company, with offices in Pittsburgh and its plant here, obtained 15 cars of coal from the Pittsburgh fuel administrator's office. This consignment has been received in addition to a number of cars of coke.

WEST VIRGINIA

Charleston—The last official act of State Chief of the Department of Mines Earl A. Henry was to revoke the certificates issued by the department to W. M. Printiss, superintendent, and I. M. Pitman, mine foreman, of Yukon Pocahontas Mine No. 1, at Susanna, McDowell County, where an explosion occurred Dec. 15 and resulted in the loss of 18 lives. Chief Henry said that had the mine foreman and superintendent performed their duties, the explosion could have been prevented because the mine was in first-class condition.

Deeds, agreements and other papers in a $385,000 coal land transaction, by which the Black Band Fuel Co. has disposed of its coal, lumber, mining, merchandising, railroad and other interests at Olcott, on Coal River, in the southwestern end of Kanawha County, to John Kresge, of Boston, were placed on record in the Kanawha county clerk's office. Five thousand acres of mineral and timber lands, including mines in operation, stock in the Kanawha Central R.R. and the company stores were involved in the deal.

Morgantown—A deal was recently closed by Blaine St. Clair, of Union District, by which he leases his three veins of coal—the Sewickley, the Redstone and the upper Freeport—to Charles Kuhn and others of Westmoreland County, Pennsylvania. The coal, which underlies a tract of 150 acres overlooking the Monongahela River, will be mined on a royalty basis. Mr. St. Clair is to receive a royalty of 15c. a ton and is guaranteed at least $1500 a year.

ALABAMA

Birmingham—The Gulf States Steel Co. has taken over the properties of the Sayre estate, consisting of 15,000 acres of coal lands, with a good mine under operation, 150 coke ovens in full operation and railroad appurtenances to the mines and ovens. The deal involves a cash outlay of $700,000. The Gulf States Steel Co. will immediately take over the properties and figure on some big developments.

The Birmingham-Trussville Iron Co. is making good progress in the construction of its coal washery and other plant structures at Labuco mines, from which an output of 1000 tons per day is now being obtained. A large number of dwellings are in course of construction for housing employees. The 300 coke ovens of this company at Trussville are now in blast, the coke being disposed of to outside interests pending the placing in blast of its furnaces, which are practically ready for the torch.

ILLINOIS

Pana—The North mine of the Pana Coal Co., which has been idle for almost ten years, will be reopened as soon as repairs and improvements are completed. About 200 men will be employed. This will give Pana four of the largest mines in the state, two operated by the Pana company and one each by the Penwell and Smith-Lohr companies.

Carlinville—Development work has been begun on the Herman Schoper property near here, recently purchased by the Standard Oil Co. It is understood that two shafts will be sunk. Company houses are to be erected for the employees but assurances have been given by C. M. Clark, the Standard Oil official in charge of the development, that all business will be transacted through Carlinville. Merchants have been asked to contribute to a fund of $5000 for building a cinder road to the mines. The field to be developed includes parts of South Otter, Honey Point, Shaw's Point, Nilwood and Carlinville townships. The Standard has also bought the mine of the Carlinville Coal Co. and is preparing to double its output.

Bethalto—The mine of John Kowaljik here will have to close because Kowaljik is an enemy alien and cannot, therefore, obtain a license to buy powder. He applied to the explosives license agent at Edwardsville. It was refused, and his case was reported to the Bureau of Mines at Washington. Kowaljik was born in Germany. He has been in this country since 1913 and took out first papers in 1916.

Lincoln—An attempt is to be made to reopen the Lincoln mine which has been closed several weeks on account of fire. It is believed the flames have been smothered by sealing. The shaft will be opened in a few days and if any fire remains an attempt will be made to extinguish it.

Farmersville—The Elly Coal Co. is preparing to reopen its mine here, which has been closed three years. The débris has been cleared away and the mine will be retimbered. It formerly employed 300 men. B. C. Perry and Mr. Hamilton, of Girard, are interested in the company.

Orient—The mine of the Chicago, Wilmington and Franklin Coal Co. has been idle several days on account of a fire that destroyed the screening plant.

OHIO

Martins Ferry—The Clarkson Coal Co.'s No. 2 mine at Fairpoint has devised a scheme to keep the mine going at top speed regardless of the lack of motive power on the B. & O. division. The loaded cars are being dumped in an open field and already the pile of coal has assumed enormous proportions. Should the present rail congestion be relieved in the near future it will be an easy matter to load the cars from the elevated field position.

A representative of the Consolidated Copper Co., of Canada, has been in Belmont County looking after the purchase of coal lands for his company. He states that coal there costs $11 a ton, his idea being to purchase coal lands and operate the mines, shipping the product direct.

Steubenville—Announcement was made here that the Adena Coal Co., which has been operating in the vicinity of Adena for the past two years, has purchased the Laura O. Hastings farm of 33 acres and a five-acre tract from W. P. Moore, paying $9575 for the land, or $250 an acre, the highest price ever paid for coal property in that section of the county.

WASHINGTON

Wilkeson—All hope of rescuing the six entombed miners who were trapped by a vein of water in the mines of the Wilkeson Coal and Coke Co. has been given up, although 200 men are working on the cave-in.

Foreign News

Tokio, Japan—Discovery of the most extensive deposit of anthracite ever found on the main island of Japan is announced. It extends for more than 18 miles along mountain ranges and, as it is near the naval base at Maizurn and in close proximity to the railway, the discovery is regarded as of great importance.

Quebec, Que.—At the annual meeting of the British Columbia Skeena Coal Co., Dec. 28, it was announced that recent investigations on the 30,000 acres of anthracite coal lands on the Upper Skeena River, northwest of Prince Rupert, had led to the discovery of large deposits resembling in analysis the smokeless coals of Pennsylvania. This is stated to be the only known occurrence of this kind of coal in Canada, and as it is much in demand for naval purposes, the find is regarded as important.

Berlin, Germany—In its issue of Dec. 11, "Vorwaerts" states that the coal business in Berlin is simply chaos, and the resultant misery in the poorer quarters is beyond words. Berlin municipal enterprises are almost in an equally bad position. Berlin gas and electricity works, the city overhead and underground railways, are so scantily furnished with coal that they "live from hand to mouth." The slightest interference with the present slender supplies, "such as any frosty day may bring, must compel a partial, if not total, stoppage." The authorities are said to be letting matters drift.

Personals

Edward Wallace, editor of the "United Mine Workers' Journal," has enlisted in the Canadian Army. Wallace was rejected by the American Army officers, being 50 years of age.

Ralph E. Buckman has resigned his position as superintendent for the Indian Creek Coal and Coke Co., to accept a similar position with the Langeloth Coal Co. at Langeloth, Washington County, Pennsylvania.

Joseph B. Connell, connected with the C. M. Dodson Coal Co., Hazleton, Penn., in the capacity of superintendent of the mines at Beaver Brook, Morea and Locust Mountain, has been appointed general manager for the company, with headquarters in Bethlehem.

Frederick W. Wyant resigned his position in the engineering department of the Vandalia Coal Co. at Linton, Ind., to accept the position of division engineer of the Somerset division of the United Coal Corporation. He entered upon his new duties Dec. 26, with headquarters at Boswell, Somerset County, Pennsylvania.

Frank J. Foley, manager of the mining section of the Industrial department, Westinghouse Electric and Manufacturing Co., has accepted a position as manager of the mining and traction department of the Edison Storage Battery Co., located at Orange, N. J. Mr. Foley, who is a graduate of Pratt Institute, Brooklyn, has been with the Westinghouse company for 12 years, commencing with the service department in New York City and later being transferred to the industrial department at East Pittsburgh.

Obituary

Howell Harris, of Scranton, Penn., one of the best known mining engineers in Pennsylvania, died at his home on Jan. 2 after a long illness. He was 55 years old and was general superintendent of the mining properties operated by the late William Connell.

Industrial News

Norton, Va.—The Norton Coal Co. is having plans prepared for the construction of fifty additional coke ovens, to provide for increased capacity.

Lincoln, Neb.—The Grand River Coal Co. has filed notice of an increase in its capitalization from $25,000 to $175,000 to provide for extensions and improvements.

Jackson, Ky.—The Jackson Block Coal Co. has filed notice of an increase in its capitalization from $12,000 to $30,000 to provide for expansion.

Marion, Ohio—In order to get better cooperation among the retailers, the Marion Retail Coal Dealers' Association has been organized. It is planned to secure a more equitable distribution of the available coal supply.

Philadelphia, Penn.—The Pennsylvania R.R. has placed an embargo on all carload lots of freight, except foodstuffs and coal, coming from other lines to the Pennsylvania. The embargo affects all Pennsylvania R.R. lines east of Pittsburgh.

Cleveland, Ohio—With low gas pressure, zero weather and a shortage of coal, this city is again threatened with darkened streets. One plant of the Otis Steel Co., employing 600 men, recently closed because of fuel shortage, it is said.

Columbus, Ohio—For the first time in history, solid trains of coal were being rushed through the Union passenger station with right of way over all other service. The coal is from Ohio, Kentucky and West Virginia fields and consigned to the East.

Reading, Penn.—E. H. Deysher, John M. Ebersole and Clifford H. Price, Reading, and G. E. Aleman, Shoemakersville, have organized the Anthracite Reclaiming Co., and are planning for the construction of river coal washeries at Arders and Kline's Grove, near Sunbury.

St. Louis, Mo.—Thomas R. Mould, of St. Louis, has filed suit in the Belleville Circuit Court against the Suburban Coal and Mining Co. for $150,000 damages, alleging that the company has undermined property owned by him in St. Clair County and has removed several thousand tons of coal.

Wellston, Ohio—The Model Service Co., of Defiance, has purchased a short branch of the Cincinnati, Hamilton & Dayton running between Wellston and Dean from a junk dealer of Cincinnati. The purchasing company will operate the road in the interests of the coal mines along the line.

Pittsburgh, Penn.—The Verner Coal and Coke Co.'s purchases in Findley township, Allegheny County, have been increased by the company taking title to 72 acres from James Lee Mossey, and 36 acres from David McBride, for which $25,424 was paid, according to deeds recorded.

Wilkes-Barre, Penn.—In conformity with the State law signed by Governor Brumbaugh July 19, 1917, requiring motor-driven ambulances instead of the horse- or mule-driven ambulance, local coal companies during the week received a number of machines designed especially for mine service

Columbus, Ohio—The Ohio Fuel Administration has issued orders denying certain wagon mines in Ohio cars unless they comply with the orders of the Fuel Administration as to price. It is claimed that many of the mines are paying no attention to the price schedule as fixed by the Fuel Administration.

Lexington, Ky.—The State Railroad Commission on Feb. 7 will sit here to hear the complaints of the Lexington and Versailles, Ky., against the Cincinnati, New Orleans & Texas Pacific. This is to the effect that the railroad is discriminating in rates on coal to cities opposite Cincinnati against Lexington and Nicholasville.

Akron, Ohio—The coal pool at Akron, Ohio, was started the first of the year with T. E. Barry, of the Pittsburgh Coal Co., as director. The committee consists of Jay Converse, secretary-treasurer of the Stillwater Coal Co.; John Rawley, of the Akron Coal Co.; Louis Klages, of the Klages Coal and Ice Co., and George Smith, a jobber.

Indianapolis, Ind.—Coal production in Indiana during the month of December will total nearly 2,000,000 tons, more coal than has ever before been taken out of the mines of the state in one month, according to E. I. Lewis, chairman of the public service commission. This figure is based on reports made by railroads and checked by mine operators.

New Albany, Ind.—Options are being taken on coal land in Pike and Warrick Counties, Indiana, as a result of the report that the Baltimore & Ohio R.R. would construct a line through that section. The switch would open up thousands of acres of lands, showing veins 6 and 7 ft. thick. Much of it could be stripped by steam shovels, it is said.

Wilkes-Barre, Penn.—A ruling has been made by the board of appeals for the middle judicial exemption district that miners who are actually engaged in the cutting of coal are to receive deferred classifications and will be enrolled in the second class. The board members believe that such men can be of more service to the country at work in the mines than in the army.

South Charleston, Ohio—In an address at a farmers' meeting here recently Governor Cox of Ohio declared that the 1,000,000-ton excess of coal in the Northwest, "occasioned by the blunder of Fuel Administrator Garfield," is responsible in large measure for lack of fuel in the East and for transports loaded with supplies for troops in foreign countries, reported tied up at ports.

Columbus, Ohio—The Ohio Fuel Administration is making a campaign to increase the efficiency of coal burned in steam plants throughout Ohio. As a result a number of Economy Inspectors have been employed and are going about instructing firemen in the proper use of fuel. At one plant the inspectors secured 50 per cent. better efficiency. The plant formerly used 90 tons daily.

Tyrone, Penn.—The J. C. Stone Co., manufacturers of mining and ventilating machinery, has recently passed its ten-year milestone in business. Started a decade ago, the success of the venture has proved greater than the founders' most sanguine expectations. The company is beginning its second ten years with flattering prospects, and is backed by an organization of expert and efficient men.

Louisville, Ky.—The Jefferson County Fuel Committee has revised the margins allowed to dealers on coal, increasing that on domestic coals and reducing that on industrial coals, and, generally, equalizing the entire list. Margins now in effect between cost to the dealers for the coal and his selling prices are as follows: Domestic sizes, $1.95; industrial coal, $1.50; anthracite, $2.10; coke, $2.50.

Akron, Ohio—About 10 mines of the Buckeye Coal and Railway Co., located in the Hocking Valley, were forced to suspend operations last week because of lack of water for the boilers of the power plant located at Jobs. For some time there had been a shortage of water, and it was hauled from Nelsonville, a distance of six miles. Lack of motive power on the Hocking Valley Ry. has made it necessary to suspend.

Columbus, Ohio—Three mines formerly owned by the Luhrig Coal Co., of Cincinnati, located on the main line of the Baltimore & Ohio west of Athens, will soon be put into operation by New York capitalists, which recently secured possession of the property. The mines have been idle for more than three years. It is expected to work about 400 men when the mines are ready for operation.

Connellsville, Penn.—Negotiations were closed recently by which the Smithfield Coal and Coke Co., plant was consolidated with the Clark Coal Co., which was incorporated some time ago by E. C. Higbee, W. D. McGinnis, Bruce F. Sterling and C. D. Clarke. The combine, which will be known as the Clark Coal Co., will have 80 acres of Connellsville coking coal, 34 ovens and a very complete coking equipment.

Columbus, Ohio—The Columbus Railway, Power and Light Co., which has been hampered because of lack of fuel, has secured a half interest in a coal mine in West Virginia which has a daily capacity of 1500 tons. But soon after securing the interest the greater part of the output was commandeered by the Federal Government. Application has been made for better transportation service to get an adequate coal supply.

Pittsburgh, Penn.—In a drive by the Government on violators of the coal price fixing regulations, Harry Hamilton, president of the Standard Coal Co., was placed under arrest at the Hotel Nixon, Butler. Hamilton is accused of charging consumers in excess of $2.45 a ton for run-of-mine coal, the price fixed by National Fuel Administrator H. A. Garfield. The Government asserts that Hamilton's company charged as much as 80c. a ton more than the fixed price.

New York, N. Y.—Shipment of coal was given preference over passenger traffic in an effort to relieve the coal famine here and in New England. The Pennsylvania R.R. tubes under the Hudson River are now being used for freight as well as passenger traffic to rush coal to Long Island and points served by the New Haven lines. The Baltimore & Ohio R.R. uses the Pennsylvania station in Manhattan for its passenger traffic, the change necessitating a revision of the schedule of both roads.

Philadelphia, Penn.—Government confiscation of Pennsylvania coal brought a protest from State Fuel Administrator Potter in the form of a telegram to Federal Administrator Garfield. The confiscation objected to is that which takes coal from this state for points in the South and Southwest, where there are coal fields adequate to provide for present fuel requirements. Mr. Potter was forced to this step by the increasingly desperate situation in this city, where there are now thousands of homes without coal.

Columbus, Ohio—The Buckeye Coal and Railway Co., of Columbus, will soon equip 20 mines, located in the Nelsonville and Bailey Run districts, with electrical power. In all, 12 mines in the Nelsonville district will be furnished with power from the Ohio Light and Power Co., Newark, Ohio. Eight mines in the Bailey Run district will be supplied with power from the Hocking Power Co. All the mines are practically new operations, and when the electrical equipment is complete the output will be largely increased.

Connellsville, Penn.—By the sale of the 100-acre coal field underlying the Fayette County poor farm on Jan. 5 at $5000 an acre, a new record value in coal was attained. George Whyel, a prominent coal operator of western Pennsylvania, is the purchaser. The last high-water mark sale was made by J. V. Thompson to a Pittsburgh capitalist, who paid $1800 an acre for the Pittsburgh 9-ft. seam in the Klondyke region. Recently H. C. Frick purchased 12,000 acres of the Thompson coal lands in the same vein at $550 an acre.

Pittsburgh, Penn.—A. S. McKone, banker, of Tunnelton, W. Va., purchased 350 acres of coal land, containing the Upper Freeport seam of coal, on the Baltimore & Ohio R.R., at the west end of the Tunnelton, Preston County, W. Va., from the Merchants Coal Corporation, a subsidiary of the United Coal Corporation, together with 150 acres from other parties. A company has been organized and work has been started on the development and construction of a mine, to be turned over, when completed, to the Baltimore & Ohio R.R., for coaling locomotives.

St. Louis, Mo.—Wallace Crossley, Missouri Fuel Administrator, is getting after the operators who double up as jobbers for the sake of the 15c. a ton allowed to jobbers under the Government's price schedule. Quite a number of the operators have been doing this, he says, and if they don't stop it they will be prosecuted. He says that evidence is being gathered against them. The jobber, he declares, is a necessary factor in the coal trade and he intends to protect legitimate jobbers from a continuance of the practice.

Huntingdon, Penn.—While the citizens of Huntingdon and other central Pennsylvania towns are suffering from lack of coal, the sidings of the Huntingdon & Broadtop R.R. here contain over 800 cars loaded with bituminous coal from the South Broadtop region. These loaded cars have been on the sidings here for more than a month, while others are accumulating all along the line. There is no present indication of any outward movement of the loaded cars, and a general explanation is given by company employees that the delay in shipment is due to lack of motive power.

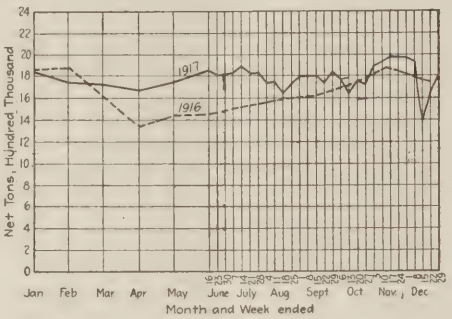
Indianapolis, Ind.—Paul Poynter, who has charge of the wagon mines in the state for the Federal Fuel Administration, announced recently that he had issued an order increasing the prices which wagon mine operators may charge for their product when it is shipped over the railroads. This does not do away with the Government regulation on the price at the mouth of the mine, where the coal is sold for wagon delivery. The mine price of Indiana coal as fixed by the Government is $2.65 per ton of Indiana lump, $2.40 for mine-run and $2.15 for screenings. Mr. Poynter's increases for the wagon mines that have turned to rail delivery are $3.25 for Indiana lump, $3 for mine run and $2.75 for screenings.

Chicago, Ill.—After an existence of nine years as a department of the Chicago Pneumatic Tool Co., the motor truck interests of the company were on Jan. 1 taken over by a new organization known as the Little Giant Truck Company. The motor-truck department of the tool company had grown to such proportions that a separate organization to handle its many interests became necessary. The Little Giant Truck Co. is owned and controlled by the Chicago Pneumatic Tool Co., and the officers are the same—W. O. Duntley, president; W. B. Seelig, secretary; L. Beardsley, treasurer, with T. J. Hudson, sales manager. The headquarters will remain in the Little Giant Building, 1615 Michigan Ave.

St. Louis, Mo.—The Board of Aldermen, by a unanimous vote, has rejected the proposition of a committee of railroad heads, of which W. S. McChesney, president of the Terminal Association, is chairman, to use the municipal free bridge provided they are permitted to continue charging the 20c. a ton arbitrary on coal. The proposition was based on the contention that the Interstate Commerce Commission, sustained by the United States Supreme Court, has held that 20c. is a reasonable charge for the hauling and switching service in transporting coal from East St. Louis to St. Louis. Its rejection is on the ground that neither the commission nor the court has passed upon the question of an arbitrary for the use of the free bridge. Mayor Kiel and city officials have gone to Washington to offer the bridge to Director-General McAdoo for the use of the railroads.

MARKET DEPARTMENT

GENERAL REVIEW



Cold weather causes excessive domestic demand. Car supply holding back distribution. Conditions, especially in the West, slightly better.

The production and distribution of anthracite is proceeding as rapidly as transportation facilities will permit. This is not, however, fast enough to satisfy the demand. The various local fuel administration boards and committees are perfecting their organizations, the efforts to relieve congestion on the railroads are beginning to make themselves felt, there is a slightly better car supply, and it is believed that conditions in general are easier than they have been in the recent past. It can hardly be expected that government regulation of the railroads will work any miracle to coal distribution. It is believed, however, that the beginning of better transportation facilities has been made. From all over the country the demand of industrial consumers, especially for bituminous, are heavy, and it is feared that in many localities, even in spite of such economy measures as lightless nights and the like, many industrial plants will be compelled to suspend operations. Conditions in New England along this line became especially acute, and a priority order was issued for the shipment of 500 cars daily to the New England administrator, to be distributed by him as necessity might dictate. It was feared that this priority order to New England would curtail the supply of fuel to other parts of the country, such as New York City and its vicinity, and a request was immediately dispatched to the National Fuel Administrator, urging that this order be rescinded. This request was denied, and it is feared by many that serious economic results will follow. This will not necessarily be the case, provided increased transportation can be secured. Throughout the West and Middle West the situation has been somewhat relieved. Coal standing on tracks in various railroad yards has been in several instances commandeered by local fuel authorities, with the result that temporary local stringency has been to a greater or less extent relieved. The production prospects are in several instances somewhat better than a week or two weeks ago. In the Pittsburgh district several operators of small mines were arrested for evasion of the government price. The tonnage involved in these evasions was almost insignificant. The conditions in the manufacturing centers of the Middle West such as Detroit, Chicago and St. Louis, have been somewhat relieved during the past week. A freer movement of coal over the railroads has effected this change. The needs of St. Louis are for the time being at least well provided for. Chicago has received heavier shipments, but no stocking could be accomplished. Detroit, also, has received more coal during the past week than the previous one, but this has had little effect upon dealers' yards or the supplies held by them. Many domestic consumers in Detroit have suffered severely during the past month. In the extreme West it is believed that the situation will be somewhat relieved by the substitution of coals mined near at hand in place of the somewhat better fuel brought in by long railroad hauls. The shipment of coal from docks in Milwaukee to the states lying to the northwest has ceased, and it is believed that Wisconsin's supply for the present winter is both ample and secure. There is nowhere manifest a disposition to be critical as to the kind or quality of fuel secured. The principal concern of consumers, both industrial and domestic, is to get coal—something that will burn and generate heat, and the question of whether it is lump, egg or screenings is of entirely secondary importance. While many localities are still on the ragged edge of want, and nowhere does the supply equal the demand, it may be safely said that the situation as a whole is better than it has been in the recent past.

A Year Ago—Retail anthracite trade easier, but the wholesale situation as stiff as ever. Very sharp decline in bituminous quotations. Preliminary discussions on new contracts. Improved car supply and heavy shipments in the Middle West.

COAL PRODUCTION

In the five working days of Christmas week the soft-coal mines are estimated to have produced 8,964,000 net tons, an average per working day of 1,793,000 tons. The recovery from the extraordinary depression of mid-December continues, but the rate of production has not yet attained the mark set in November. The increase was effected in spite of continued adverse weather conditions. A preliminary estimate places the December production at 42,050,000 tons, the lowest recorded since April, 1917. On this basis the entire 1917 production should be approximately 544,142,000 tons, representing an increase over 1916 of 8.3 per cent. The production of beehive coke, following the bituminous industry as a whole, rose from 96,086 net tons, during the preceding week, to 107,655 tons per working day. Anthracite shipments were reported as 29,228 cars.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED

District	Dec. 8	Dec. 15	Dec. 22	Dec. 29
Bituminous: shipments, 114 roads.	198,161	149,122	177,599*	158,290†
Anthracite: shipments, 9 roads...	40,566	31,672	36,083	29,228†
Beehive coke shipments, 4 roads...	12,509	10,335	11,835*	11,050†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

The Iron Age—The first week in the new year has brought blast furnace and steel works' operation to the verge of complete demoralization. Western blizzards have made vastly worse what has been for weeks a serious situation and embargoes on shipments have made conditions at rolling mills almost hopeless. Scores of blast furnaces have been banked in the Pittsburgh, Youngstown, Wheeling, Cleveland and Chicago districts. Steel works in the same territories have been able to operate at but 50 to 75 per cent. of capacity. The East, while spared fresh snow blockades, has had record low temperatures and so little fuel has been delivered to steel plants that working schedules have gone to pieces. Never has the industry been so generally crippled or with so poor a prospect of any early return to normal conditions.

Bradstreets—Post-holiday influences, inventorying, intensely cold weather east and south and heavy snows at the west have made for a quiet week in ordinary distributive trade, and weather plus coal and car shortages have curtailed manufacture and industry.

The Dry Goods Economist — Manufacturers, wholesalers and selling agents in most lines of dry goods have completed their stock-taking and are now in a position to take up the problems of the new year with a full knowledge of the actual results of 1917 business.

The American Wool and Cotton Reporter—More confidence and interest was evident in the wool trade for the week under review. The trade is gradually recovering from the shock of the government regulation announcement. The market is quiet but very strong.

Marshall Field & Co.—Current wholesale shipments of dry goods for the week are well ahead of the corresponding period of last year. Road sales for both immediate and future delivery are about equal to the same week in 1917. The number of customers in the market has been slightly less than in the same week a year ago. The market on domestic cotton continues strong. Collections are good.

Atlantic Seaboard

BOSTON

Situation grows worse rapidly. Emergency supplies cannot begin to cope with demands. First cargoes arrive for Fuel Administration. All-rail deliveries also begin to reach destinations.

Bituminous — The Panama collier "Achilles" was recently diverted for one trip to help out the urgent situation in New England. But 12,400 tons is only a drop in the bucket. The bulk of the cargo went to hospitals and similar institutions that were very near distress for fuel. The New England order issued both by the Federal Fuel Administrator and by the Director-General of Railroads was secured through the efforts of J. J. Storrow, New England fuel administrator, and is intended to virtually give priority to the needs of this territory. Certain mines are designated for a given amount of coal per day, in all aggregating 500 cars from the different roads, all of which is understood to be equipment in addition to the allottment of cars the designated mines would regularly receive, the order being effective Jan. 8.

The railroads are also among the consumers in serious straits for fuel, and part of the 500-car order is to relieve them. A long list of industrial plants engaged in work on war orders is also included and strenuous efforts are being made to meet the most pressing of the demands. The City of Lynn finds its reserve so far depleted that all its industries have agreed to work on half time until an adequate supply can be received. The harbor, as in the case of New Bedford, Fall River, and other ports, is completely frozen over and water movement has been so completely paralyzed that any relief must come by rail from points like Boston where the harbor is navigable.

Meanwhile, various steamers are arriving, and it is hoped that with milder weather the end of the week will see some relief. The famine is widespread, and "acute" is not a sufficiently strong word to describe the situation. A great many plants have been obliged to shut down and there is no knowing what will be the outcome. Should the New England order be revoked, the situation will be hopeless.

NEW YORK

Coal situation easier, but still serious. The authorities assist in relieving the suffering among the poor. Receipts show increase and prospects are brighter. Lack of bituminous delays sailings. Car shortage shows no improvement and miners are restless.

Anthracite—The strenuous efforts made by the local fuel administration, railroad officials and coalmen to relieve the coal situation have been partially successful and there has been a better distribution of fuel during this week. This market has gone through the hardest week in its history. Temperatures each day were either below or near the zero mark. The rivers and New York Bay were filled with heavy ice and in the vicinity of the coal terminals this became so thick that the services of the heaviest tugs in the harbor were necessary to penetrate it and make a channel for the coalboats.

Relieving the situation meant hard work for the state and county fuel administration and for A. H. Smith, president of the New York Central Lines, who is the director-general of the railroads in the East. They were ably assisted by the State Fuel Conservation Committee.

The extreme low temperatures caused much suffering and with the rivers and bay practically one mass of ice the situation became serious. There were large tonnages of coal reported as being at the loading docks but it was impossible to move it. Heavy railroad tugs assisted by U. S. Navy tugs and, in one instance, by one of the big Sound steamers, were em-

ployed in making a passageway for the coal barges and after many hours of hard work were successful in their efforts.

Several of the companies also aided in the work of relief by sending coal in cars direct to their piers along the North River where the coal was loaded into the dealers' wagons. The situation in Brooklyn and other parts of Long Island was helped by the sending of coal trains through the Pennsylvania tunnels to Long Island City, while dealers whose yards are located along the Brooklyn water-front went several days without coal owing to the frozen condition of Newtown Creek and Gowanus Canal.

The low temperatures played havoc with the supplies in the cellar bins and many residents, fearing a coal famine, closed their homes and took residence in apartment hotels for the winter. Churches in many instances closed their main buildings and conducted services in smaller rooms. Many of the city hospitals were within a few hours of being without coal and in some instances similar institutions were without fuel.

The appeals from the poor became so numerous that Mayor Hylan instructed the police to ascertain how much coal is in the bins of the residents of the city and to solicit contributions of coal for division among those who needed it. In this way more than 1000 tons was divided in small lots among the needy. The forces of the various city departments were used in making the deliveries. Mayor Hylan also appointed a committee headed by Harry T. Peters to devise ways and means to conserve the coal supply and also to raise funds for the purchase of coal for the poor. Besides Mr. Peters the committee has among its members M. F. Burns, Thomas Farrell, Rudolph Reimer, T. V. Patterson and J. F. Bermingham, all prominent coalmen.

The failure of a general adherence to the rules of the State Fuel Administrator that all advertising signs and other unnecessary lights be darkened six nights a week, Saturday excepted, resulted in the appointment of a special committee to enforce the rule.

The efforts to relieve the situation during the time the nearby waters were filled with ice, resulted in the loss in four days of 27 barges each containing an average of 500 tons of coal.

While no definite announcement has been received here regarding the pooling of all anthracite shipments at tidewater docks, some dealers look upon this as the only solution of the situation.

With the demand for domestic coals leading, the steam sizes are short and hard to get. Wholesale dealers are unable to find any supplies, all production having apparently been sold at the mines or already on contract.

Continued efforts to secure the fixing of a gross margin for retail dealers in Manhattan and the Bronx has resulted in the county fuel administrator deciding upon the following margins which have been sent to Washington for approval by the Fuel Administration officials. Domestic sizes, $2.50; pea and soft coal, $2.10 and buckwheat, rice and barley, $1.90. These margins will not make any substantial change in the retail prices of coal in the two boroughs.

The threatened tie-up of the drivers and auto-truck operators of the retail dealers has been adjusted by the granting of weekly increases in wages of $3.

Receipts have been so small that most retail dealers have practically discontinued deliveries. Instead they have disposed of their stocks at the yards at 60 cents per cwt., the prices fixed by the Fuel Administration authorities.

One of the most serious situations confronting lower New York was the issuing of an order by the New Jersey fuel authorities preventing the carting of coal from that state across the river to New York. A continuance of this order would have resulted in shutting off the coal supply for all of the big office buildings, but an appeal to Washington soon resulted in its being rescinded.

Current quotations, per gross ton, f.o.b. Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck	4.30@5.00	5.50@6.00
Rice	3.75@3.95	4.50@5.00
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Conditions in the bituminous market continue to be serious with no immediate prospect of betterment. Supplies are not nearly sufficient to meet the demand and the condition of the water surrounding this city has interfered greatly with the transportation problem.

The delay in shipping has become extremely serious. The number of vessels tied up in the harbor because of the lack of fuel has reached 200 notwithstanding the efforts made to secure bunker supplies for them. Among the ships are passenger vessels carrying mails to foreign countries. The piers are also congested with freight destined for other lands.

A Washington dispatch that arguments had been presented to Dr. Garfield for an advance of $1.05 per ton in the mine price of bituminous coal, making the price $3.50 instead of $2.45, found much favor among the dealers here and it was the belief that at least part of the increase would be granted.

Dumping into barges at the docks has become more active but owing to the ice floes delivery at the various yards has been slow. The shortage has seriously impeded various industrial plants and many of them have been forced to suspend operations pending the receipt of fuel.

The Government operation of railroads has, so far, not made any appreciable difference in car supply. Operators report conditions similar to those existing for the past several weeks. Mine workers are restless.

Local dealers believe the local situation is just as serious as the New England situation and that more coal should be sent here. Three barges loaded for Boston and containing about 1200 tons were taken by the local fuel administration authorities on Saturday and devoted to local uses.

The order of Director-General of Railroads McAdoo increasing the demurrage rates, to take effect on Jan. 21 will no doubt have a potent effect upon the car situation and ought to result in an improvement.

No definite announcement has been made regarding the renewal of contracts, but it is expected that except in special instances, few contracts will be made for the coming year.

It was stated early this week that 1,009,000 tons less of bituminous coal has been received in this city since July of 1917 than were received during the corresponding period of the previous year.

Dr. Garfield notified State Fuel Administrator Wiggin on Wednesday that he would not rescind the priority order giving New England 500 cars of bituminous coal per day. The refusal came after appeals for more coal had been made to Dr. Garfield by Mr. Wiggin and Mayor Hylan, the latter asking that 1500 cars of coal be allotted to New York daily and given priority orders on the railroads. Dr. Garfield notified Mayor Hylan that he would not issue priority orders to send coal to New York.

Unless a normal supply of coal is brought to New York quickly it is feared many of the large manufacturing companies will have to shut down. It is also feared that most of the public schools will be closed next week.

PHILADELPHIA

Anthacite trade badly upset by zero weather. Shipments light and much suffering among consumers. National authorities order relief. New retail prices in effect, despite protests. Steam coal in extreme demand. Bituminous held back by abnormal weather. Better car supply promised. No price increase yet. New bunker price effective. No contract activity.

Anthracite—Trade conditions have never been so upset in the city's history. With the thermometer hovering near zero for a week, and from 10 to 20 degrees below throughout the mining region, there have been panicky times to say the least. As the dealers' yards were bare, or nearly so, before the severe weather arrived, the situation soon became desperate. There has been much suffering and in two instances the deaths of infants were ascribed to the lack of heat in the homes. Many manufacturing plants also closed and at the end of the week at least 25 per cent. of the city schools were closed for want of fuel.

Lately the weather moderated to near the freezing point and while this helped conditions, yet there continued to be much suffering and many of the schools were unable to reopen. The various fuel committees admitted that they were at their wits' end. They finally succeeded in convincing Secretary McAdoo of the seriousness of the situation and he, late in the week, ordered an embargo on freight of all kinds with the exception of coal and food-stuffs on all roads from Pottsville to Philadelphia. Even at this it was almost a week before the effect began to make itself manifest.

A canvass of the retail yards disclosed about 75 per cent. of them closed with "no coal" signs displayed. In the southern section of the city and parts of West Philadelphia, conditions were most alarming, because whenever a car of coal arrived there were mild riots. A crowd would gather, climb on the car and help itself. Policemen appeared none too anxious to make arrests, and while they tried to make an example of a few, the prisoners were soon discharged by the magistrates with a reprimand. In one day as many as ten cars of coal were taken on the street in this manner, the loss falling upon the railroad company, as the cars had not as yet been delivered to the dealers' yards. Many other cars had from one to five or more tons removed and in many cases this loss fell on the dealers, as their only remedy would be to refuse the car or ask to have it re-weighed.

Government control of prices has proved a blessing to the consumer. Consumers clamoring for coal offered almost any price, and no one questioned the present rates. It is not believed there is any extortion and the price arrangement of a $2.50 gross margin over actual cost as fixed by the coal committee is being adhered to. Retail prices run about as follows: Egg, $8.80 to $9.20; stove, $9 to $9.70; chestnut, $9.15 to $9.80; pea, $7.55 to $7.90. This range includes the lowest rates as charged by dealers who are handling company coal, and the higher ones as charged by those who are being supplied by the independents. Where a dealer buys from both the large and small operators some effort is being made to average the prices.

This week the Fuel Committee has taken advantage of the power recently granted it to confiscate coal in cases of urgent need. A recent instance is the case of directors of big companies who for years have been in the custom of buying their domestic coal by the carload and having it hauled to their homes by a dealer. This week there were several cars so shipped, but Chairman Lewis immediately notified the dealers to allow consignees but 30 days' supply, and to take the balance into their stock in the regular way.

The City Fuel Committee stated this week that all public buildings, such as hotels and theaters, violating the regulation as to keeping the temperatures of their buildings at 68 deg., would be subject to more drastic rulings in regard to the use of heat, a copy of which supplementary rules has already been published.

The city authorities have now reached a clear understanding with the fuel committee and are thoroughly coöperating with it. Many of the city departments, such as the water works and police stations have been running on small stocks, yet it is not believed they will suffer interruption. Already a number of public spirited business men with heavy reserves of coal have offered their supply of coal to the city in case of need.

This week the local gas company has been running half page notices in the papers asking consumers to conserve the supply and also warning them that the gas may be suddenly shut off and cautioning the people not to allow lights to burn all night, because of the resulting danger should the flow suddenly stop.

The small sizes of coal are in abnormal demand and apparently there is no steam coal for sale. None of the large companies and few of the independents will book any additional business. The prices continue to be held in check and in no way reflect what could be obtained. Buckwheat at $4.15, or $4.35 through brokers, is about the limit, although the demand is enormous. Rice at $3.35 or $3.55 is almost as active. Barley is also strong at $2.35 or $2.55. Culm has lost none of its recent popularity and is selling close to $1.50.

The prices per gross ton f.o.b. cars for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5 90	$6 05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous — The situation has grown more serious of late, with the quantity of coal for commercial use far below the demand. Many manufacturing plants are working on short time, while others have been closed down entirely for periods running from two days to two weeks. It was fully believed that with the Government control of the railroads the question of car supply would have been on a fair way to solution by this time, but the zero weather which has prevailed entirely upset the plans in this direction. However, with a fair rise in temperature recently it is now believed that the improvement of rail

conditions will be reflected in an increased car supply.

The various fuel committees have lately devoted considerable attention to the bituminous trade and one of the striking effects of their activities seems to be the gradual elimination of a coal supply to industries engaged in strictly non-essential production. As a consequence a large proportion of coal reaching here is going to plants where it is most badly needed.

Reports from the various districts shipping into this market are that the car supply has recently been only from 10 per cent. to 25 per cent. for commercial coal, although one good-sized operation has not received a single commercial car for loading since Dec. 20.

The mine operators were greatly disappointed at not being granted permission by the Fuel Administration to increase prices on Jan. 1, as had been fully expected by many. Nevertheless, they feel that their claims cannot be much longer denied, and the lowest price they figure on at this time is $3 per net ton. While they believe they should have even more than this in order to allow of a reasonable profit, still they will accept a $3 price as an evidence that the authorities are beginning to appreciate their situation.

The new bunker coal price of $3.80 went into effect on Jan. 1, this being an advance of $1.35 per net ton over the old price of $2.45, as allowed by the Fuel Administration.

While a number of good-sized contracts expired with the close of the old year, it has not increased the amount of coal for sale at the Government price, as any coal released in that manner is being applied mostly on still existing contracts, which even with the additional tonnage are far behind their quotas. So far as can be learned there is no activity in the contract business.

BALTIMORE

Bituminous supply a little easier after one of the worst weeks in history of the trade. Confiscation by fuel administrator relieves anthracite shortage somewhat. New retail prices set.

Bituminous—The first week of the new year proved one of the worst in the history of the coal trade, but the past few days brought a better supply of fuel and emergency needs are being met fairly well. After Chesapeake Bay and its tributaries had become ice-bound to such an extent that even the largest vessels could not be moved, an accumulation of coal became evident at tidewater piers. Some of this was diverted by Washington to New England, and finally another portion was commandeered by the local fuel administrator.

This action came after the local supply had dwindled to such an extent that industries in several cases were forced to part production and after the lighting company's gas supply had run so low that the system failed in many homes. With oil almost an impossibility and with many homes without coal, the failure of gas supply for heating and lighting caused real suffering for about 24 hr., as the trouble came when the thermometer stood close to zero. Conditions in the bay were finally improved by battleships sent from Norfolk to break channels in the ice to the harbor and piers. City departments were so hard hit by lack of fuel that the high pressure fire service was without coal for a brief period. The commandeering of 250 cars of coal on Monday for local distribution, however, broke the worst of the needs.

Anthracite—The hard coal situation also was finally saved by seizure of coal awheel near the city, destined elsewhere but held up by rail congestion. Previous to the seizure many homes were without coal, schools and other public buildings were closed for lack of heat, and there was much inconvenience and suffering. Reports came of children and others dying from cold and exposure. Coal dealers were at their wits' end, with long lines of would-be purchasers and little or no coal to distribute. Vast damage was done by bursting water pipes in unheated buildings.

Prices have not been the main consideration, and an advance of 25 cents a ton on prepared sizes, as authorized by the fuel administrator, passed practically unnoticed by the public. The advance was to take the place of one made each year here to care for added cost of winter hauling, and which did not become effective in October as usual. The new prices, based on the mine costs, plus freight, plus war tax and plus a profit margin of $2 on prepared sizes and $1.75 on pea coal, are as follows:

Hard white ash—Broken, $9.65; egg, $9.35; stove, $9.60; chestnut, $9.75; pea, $8.10, and buckwheat, $7.35; Sunbury—Egg, $9.60; stove, $9.85; chestnut, $10; Lykens Valley—Egg, $10.10; stove, $10.35; chestnut, $10.35.

The prices are based on the long ton, and where there is bagging or carrying the actual extra cost is added, to be not less than 25 cents a ton. Bushel sales shall be at the rate of 50 cents for prepared sizes for 80 lb.; and 40 cents for pea coal. Five cents off is allowed on each bushel where purchasers carry their own coal.

Lake Markets

PITTSBURGH

Production prospects slightly more promising. Local supplies fair. Arrests for violating set prices.

The week opened with car supplies rather poor but on the whole railroad conditions are a trifle more promising. The Greek Christmas, which fell on Monday, cut into labor supplies materially.

Local fuel supplies are practically sufficient, although there are no stocks to speak of. Reports were circulated late last week that many of the office buildings were short of coal and were in danger of being without light and heat this week. A number of coal companies near Pittsburgh accordingly made an offer to supply trucks with coal on Sunday, but there were few applicants and the conclusion reached is that conditions were not nearly as bad as painted.

The amount of coal in transit between mines and steel works has been decreased somewhat, receipts of steam, gas and by-product coal at steel works being somewhat improved. Steel output is still considerably restricted, however, by fuel shortage.

A half dozen or more arrests have been made of coal company officials on the charge of violating the set prices, and the authorities claim to have ample evidence to convict. All the cases thus far involve small producers. According to such information as has leaked out, the means taken to cover violation of the law were crude.

There is practically no free coal in the open market, but it is believed a moderate tonnage is changing hands, sellers picking out consumers to whom they prefer to sell but reporting no coal to offer against general inquiries. The market remains quotable at the set prices, $2.45 for mine-run, $2.20 for slack and $2.70 for screened, per net ton at mine, Pittsburgh district, with 15c. permitted to be charged in addition in case of sales by brokers.

BUFFALO

No improvement in the bituminous situation, but cars show some increase. Prospect of plants closing soon if no relief is afforded. Anthracite moving fairly well. Consumption heavy.

Bituminous—No member of the trade will admit that the situation has improved as yet, though the railroad changes must furnish more ability to move freight in a short time. The removal of passenger trains must produce that effect. The need of this is shown by the report from the Allegheny Valley coal region, which is estimated to have had about one day's supply of cars last week. From all sides come reports of this or that plant just ready to close for want of coal, though none of account have done so in this district yet.

The coal consumers of this city have not yet begun to learn the art of saving coal. Despite the constant fear of running out of fuel the office buildings are burning all day long hundreds of electric lights many of which are not needed. The local fuel administrator has posted notices forbidding such waste, but it does not occur to anyone that he is the one meant.

The Canadian coal-selling licenses come out much cut down, showing that the authorities believe that country to have received more than its share of coal lately.

All these indications go to show that the situation is strained and is likely to remain so to a great extent, no matter what is done. Add to this the fact that the country is trying to do a large amount of extra work and the reason for congestion is fully explained.

The bituminous jobbers seem willing to give up all contracts as soon as they expire, some of them expressing a desire to do so. Then the following Government prices will be general:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.70	4.20
Allegheny Valley	3.60	4.10

All per net ton, f.o.b. Buffalo.

Anthracite—The local supply has not been up to the consumption during the late cold snap, but the weather is mild again and normal conditions will soon restore something of confidence on the part of consumers. If they would not take more coal than they need the supply would be sufficient. During the late zero weather complaints multiplied, but they will fall off now unless the cold weather returns.

Some of the outlying districts appear to be destitute and there are instances where the town authorities have given permits to cut down the shade trees. It is the general idea that the winter severity cannot last long, as we have already had enough coal weather and snow for more than an ordinary winter.

TORONTO

Coal situation very serious. Shortage due to extreme cold, causing much suffering. Civic relief system inadequate. Fuel controller trying to arrange for supplies.

The coal situation has become very serious. Owing to protracted severe weather the supplies of fuel arriving have been entirely inadequate to meet a greatly increased demand and much suffering and hardship have resulted. This is by no means confined to the poorer classes, as many who have ordered and paid for a supply weeks ahead are unable to obtain it.

To relieve the distress the civic coal depots are delivering quarter and half-ton lots at the rate of $10.50 per ton, but have been overwhelmed with orders which they cannot fill for some time as the supply at their disposal is limited. Reports from other Ontario cities and towns indicate that similar conditions are general.

Fuel controller Magrath, now in Washington, telegraphs that he has received the promise of early shipments to Canada and that these will receive precedence over other traffic on the Canadian railways. Quotations are merely nominal, prices actually paid being variable.

DETROIT

With the railroads reporting a somewhat freer movement of soft coal, the supply appears little improved. Anthracite continues scarce. Domestic consumers suffer hardships.

Bituminous—Despite the fact that reports from railroad traffic departments indicate a considerable improvement in the volume of incoming shipments of bituminous caol, the deficiency in supply continues. Many of the industrial plants including some that are employed in turning out work for the Government are working on a day-to-day supply, which it is feared might be cut off should snowfall or a tightening of railroad congestion curtail the volume of receipts.

Demand continues urgent from steam plants. The fact that no reserve exists on which they may draw, while industrial consumption is quite materially increased in comparison with last winter makes the situation dangerous. Vigorous protest is being prepared for presentation to the Michigan and National fuel administrators, against the shipment to Detroit of Indiana coal instead of the Kentucky or West Virginia product. The objection is made by industrial consumers that the freight rate on the Indiana coal is 7c. a ton higher, while its efficiency in steam production is pronounced far inferior to the coal from the other fields, which heretofore have contributed in greater part to Detroit's supply.

The Detroit board of education has under consideration a plan to close the public schools for a month, extending the school term into the summer. The purpose of the plan is to permit distribution of supplies of coal that have been provided for school needs.

Anthracite—Very little improvement is noticeable in the quantity of anthracite coming to Detroit. The cargoes of hard coal, which the fuel administration confiscated on the steamers "Thomas Barlum" and "Richard J. Reiss" have been unloaded and distributed. The fuel administration has no further supply in sight on which to draw.

COLUMBUS

Continued cold weather is still causing considerable stringency in the coal trade of Ohio. Shortage of domestic stocks reported.

The cold wave which arrived a week ago still continues and as a consequence there is a considerable shortage of domestic and steam fuel stocks. Domestic users are probably in the worst shape as retail supplies are limited. Deliveries under the direction of the county fuel committees are being rushed and up to date only a few isolated cases of great suffering have been reported. On the whole the situation is not as bad as was the case during the first cold snap and the steps that have been taken for relief are proving efficacious.

Retailers are still restricting deliveries to small loads in an effort to make the available supply go around. Retail prices are firm at the levels fixed some time ago. Pocahontas is quite scarce and only a small

portion of the usual tonnage is coming into this market. West Virginia splints are coming in better with improvement in railroad facilities.

The steam business is active. Owing to Federal restrictions certain plants making non-essentials have been deprived of fuel. Supplies have been secured by schools, hospitals and public institutions. Some of the public utilities are short of fuel but few have had to suspend operations. In most instances they have curtailed service. Restrictions as to unnecessary sign and store lighting have relieved matters to a large extent.

Car supply, or in other words, efficiency of motive power on railroads has been better during the week and as a result the output in certain districts has been larger. Even with the intervention of a holiday the production in the Hocking Valley district is estimated at 75 per cent. Jackson and Pomeroy are credited with 65 per cent. and other districts, excepting eastern Ohio, about 50 per cent. In eastern Ohio the car service has been bad and the output is about 35 to 45 per cent. and a large portion of that is railroad fuel.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Rescreened lump, inch and a quarter, three-quarter, nut and egg	$2.70	$3.05	$2.70
Mine run	2.45	2.70	2.45
Nut, pea and slack and coarse slack	2.20	2.45	2.20

CINCINNATI

Continued severe weather and limited receipts of coal have kept the city on the edge of suffering. Careful distribution is meeting the situation.

Continued wintry weather, with low temperatures and snow, has marked the past week, although moderation at the close was noted. The limited receipts of coal necessitated extremely careful handling of the small supplies thus made available, in order to give to those actually in need of it enough fuel to prevent suffering. This was done, it seems, although it was at the expense of some industrial consumers, who were constantly on the verge of a total absence of fuel, and, consequently, of the necessity of shutting down.

There appears to be no permanent relief in sight for some time to come, as the transportation tangle is by no means straightened out, and the amount of coal in the city in the hands of dealers and consumers is greatly below normal, so that it will take some time, with favorable conditions as to transportation, to enable the desired suppleis to be stored. If any less coal were being received it would be impossible to take care of the public; and the situation at points north of Cincinnati is even worse, judging from reports.

LOUISVILLE

Coal business is Government-regulated in almost everything but name and Kentucky trade sees no developments. Hears of Government taking over industry without batting an eye.

One of the features of the week in the Kentucky coal trade has been the widely-discussed report that the Government is shortly to take over entire operation of the coal mines of the country. In view of the fact that the industry is already to most intents and purposes Government-controlled, the leading members of the Kentucky trade express no special interest in the report.

The situation is still a difficult one, although there has been some little improvement in the supply of cars, at least in parts of the Kentucky field and a larger volume of coal has gone out. Priority orders are determining the manner of distribution so that sales organizations are more or less inactive, in spite of a general deluge of inquiries and requests for consideration.

Another week of cold weather, with gas failures all over the central section, has greatly stinulated the domestic demand and increased the requirements of the retail trade. An increase of 15c. a ton has been granted the trade in Louisville on certain domestic grades, while there is still a restriction on quantities allowed and all retailers are behind a week or more on deliveries. Failures of certain grades of coal are common and in many homes and factories fuel other than that for which furnaces were designed is being burned. Lightless days and nights and other fuel-saving devices are being put into effect and generally observed. A promise of milder weather is hailed with joy by the trade.

BIRMINGHAM

Domestic situation remains critical, though relief is afforded in a measure by warmer weather and priority shipments. Steam coal being eagerly sought through the aid of state and national fuel administrators. Output at mines slowly returning to normal after the holidays. Traffic congestion hinders movement greatly.

While the shortage of domestic coal throughout southern territory continues acute, the pressure has been relieved slightly by a few days of relatively warm weather and the diversion of coal to local dealers and to other points in the state where a coal famine existed, by orders of the fuel administrator. Local dealers have received a few cars each during the week, which were quickly unloaded into waiting wagons and trucks. Few yards have any coal on hand at all, the inventory of stocks at the close of the week showing the smallest stock yet reported.

The threatened closing of the city schools for lack of fuel has been temporarily avoided by the coöperation of local producers, who have promised sufficient shipments to tide over the present critical situation. It is probable that the city will close down its lighting plant and secure its current from the local electric company to further conserve its fuel supply. The current used by the Birmingham Railway, Light and Power Co. is generated by water-power on the Coosa River.

Brokers and distributing agencies are being much perplexed by the conflicting priority orders of state and national fuel administrators and are much "in the air" as to how to proceed with coal distribution. The belief is expressed, however, that the Government will soon centralize the distribution in each field in the hands of a local committee, and will designate the essential industries which are to be supplied as near as possible with full fuel requirements. This is thought to be the most important measure of relief which could be adopted, as the continued parcelling out of the limited supply to every class of consumer is hazarding the operation of public utilities and manufacturing plants essential to the national welfare.

Operations at the mines have not assumed normal proportions as yet, though the output was better than a week ago. Several mines operated Sunday and probably produced several thousand tons of coal, mostly for local distribution.

Congested traffic conditions are impeding the movement of coal from the mines, those on the Frisco lines reporting that cars were allowed to stand under load for a week in some instances before being moved to the consignee.

Coke

CONNELLSVILLE

Car supplies improved. Receipts at furnaces somewhat better. Less coke under contract.

Car supplies were poor indeed all last week, but this week opened with an excellent supply placed, this condition combining unfortunately with the fact that Monday was the "Greek Christmas" of the Julian calendar, falling 13 days after the Christmas of the Gregorian calendar, and the supply of labor for loading was rather poor.

There has been a partial cleanup of the large amount of coke in transit, or rather nominally in transit, between the ovens and the blast furnaces, whereby receipts at blast furnaces have increased a trifle while shipments last week were no better than formerly. An occasional banked furnace has been able to resume, but production of pig iron as a whole shows practically no improvement.

There remain few, if any, price adjustment contracts, subject to the spot market, these having practically all expired Dec. 31. On the other hand, a number of new contracts, made before prices were set Sept. 24, have become operative. The general opinion is that there is less coke under contract now than formerly, and supplies offered in the open market should increase if there is anything like full production. At the moment there are practically no offerings. The market remains quotable at $6 for furnace, $7 for 72-hr. selected foundry and $7.30 for crushed, over 1 in. per net ton at ovens.

Upon the request of Warren S. Blauvelt, in charge of coke under the Fuel Administration, a meeting of all the coke operators in the Connellsville region was called for last Thursday, at Uniontown, Mr. Blauvelt meeting about 200 of the operators. He made a strong plea for energetic action to increase the production of coke, while the operators insisted that much better transportation facilities were needed. The following committee was appointed: Charles Lenhart, vice president of the Producers' Coke Co., chairman; Walter S. Klingerman, president of the H. C. Frick Coke Co.; Hart Hillman, of J. H. Hillman & Sons Co.; L. L. Willard, general superintendent of the Rainey interests; John Jamison of Jamison Coal and Coke Co.; W. A. Stone, of W. A. Stone & Co.; R. M. Fry, of the Orient Coke Co. This general committee is to appoint an executive committee of three to operate directly under the Fuel Administration, and the committee is getting its organization in shape this week.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 29 at 251,398 tons, a decrease of 39,976 tons, and shipments at 255,079 tons, a decrease of 33,678 tons.

Buffalo—While it is far from easy to get shipments or in fact to make them, the movement is kept up in some manner. The supply of iron ore is adequate for the present and the demand for pig iron is good. There is some uncertainty as to what can be done when the contracts for coke expire, as the Government will not allow them to be renewed in their present form, but so long as the coke is made the trade will get it in some way. Nominal coke prices are still $7 and $6 at the ovens for foundry and furnace, to which must be added $1.85 freight.

Birmingham—Federal control of the railroads has not thus far afforded much relief in the movement of coke, as equipment is still short, and its restricted use is embarrassing industries securing foundry coke from local producers. Deliveries are slow and insufficient to meet the needs of consumers. Production is closely approximating the output prior to the holidays. Inability to secure even repair material without great delay is causing a large aggregate loss in output. The demand is unusually strong.

Middle Western

GENERAL REVIEW

The coal trade is much concerned over the report that Fuel Administrator Garfield contemplates radical changes in coal distribution.

Operators, jobbers and retail dealers, express much interest in the report from Washington, that radical changes are to be made at an early date by the Federal Fuel Administrator. If current reports be true—and they are not now questioned—the United States Fuel Administration is to be decentralized at an early date. Deputy fuel administrators are to be appointed in each producing district, 15 or 20 in the country, who will have exclusive charge of the allotment of all coal sold and shipped.

The plan, it is understood, contemplates the joining of Illinois and Indiana as a producing territory, and the appointment of a deputy fuel administrator in charge, with headquarters probably in Chicago. His work will be confined to an association of producers and he will have ample authority to dictate the movement of the production for the territory allotted.

Should this plan be put into effect, no doubt there would be immediately installed a zoning system. This will restrirt roal movement to territory lying in the closest proximity of the direct haul to the producing mines, and coal would not be allowed to go beyond the zone boundaries. It is planned to do away entirely with cross country hauls, the hauling of one coal into and through another producing territory to a destination beyond.

Under this plan it will be seen that Illinois and Indiana users will be compelled to rely on a vastly greater supply from their own states, thereby replacing a large volume of eastern coal, that has heretofore been marketed here. It is likely that Illinois coal will supply Iowa and Missouri, and that Indiana production will find placement in its own state and Chicago. Eastern coal will no doubt continue to move into Wisconsin through the Lake gateway. Michigan also will be supplied by Lake boats through the same channels as Wisconsin.

The apparent urgent and immediate need for coal, in this part of the country near the producing centers, fully warrants the belief that early steps will be taken to divert all coal from the Northwest, for a period of 60 days, allowing a heavier movement throughout Illinois and Iowa, where the requests for relief are urgent. Reports reaching us indicate that there is sufficient coal in stock in the Northwestern territory to last for several months, this accumulation is the result of priority shipments made before Lake traffic closed, and will, it is expected, be exhausted before more is allowed to go there.

If the decentralized plan be put into force, it will not be necessary to make appeals for relief to Washington, and much of the formalities can be dispensed with by making direct appeals to the deputy in charge, who will then make allotments.

Much concern is manifest as to who the deputy will be. That the appointee should be a man entirely familiar with coal movement, and trade relationship is unquestionably an important matter to the Mid-western operators. Particularly is this true with the operators of Illinois and Indiana, where extreme care is exercised in the preparation, and vast sums of money have been expended in properly equipping plants in order to size coal to meet the needs of some particular class of trade.

The holiday season with the coal miners seems to be over judging from the manner in which production has been increasing during the past week. Generally speaking, operators are getting maximum tonnage, and have had an ample car supply, with the exception of some few small operations that have but one line of road. It was feared that the heavy snow that fell the first of the week, would have a bad effect on the railroads, but little or no trouble has been noted, particularly on such roads as the Burlington, Illinois Central and Chicago & Eastern Illinois, the heaviest coal carrying roads in the Mid-West section. In some localities, reports are being made of badly delayed shipments, but such reports are in many cases minor incidents, and do not reflect the showing that the railroads are making in handling coal shipments.

It is gratifying to both operator and dealer, as well as good news for the consumers that there is relief in sight, and what a few days ago threatened to be a deplorable condition seems to have been met and overcome. The relief it is understood is but temporary, however, should the present efforts by operators, miners, and railroads indefinitely continue, there will be no further need for alarm as far as Western bituminous coal supply is concerned, provided the Fuel Administrator does not determine other channels of movement for outputs in Illinois and Indiana. Local and state fuel administrators are active in their efforts to give relief where it is needed, and in every case the operators are responding with prompt shipments of a sufficient volume of coal to relieve the situation.

The situation as regards Eastern bituminous and hard coal is, if anything, more serious than at any time for several years. Seldom is there a car of Eastern bituminous reaching the smaller towns in this section, and the hard coal situation is but little better. What anthracite arrives is quickly absorbed in the larger terminal centers.

CHICAGO

The supply of soft coal received during the past week exceeds that of the previous three weeks. Situation greatly relieved.

The latter part of last week, City Fuel Administrator Durham called into conference a number of prominent operators and association secretaries and requested that extra efforts be made during the coming week to get sufficient coal into Chicago to take care of the urgent needs. His request was met by operators from all sections of the state, with the result that a supply of almost 3000 cars were immediately headed for this market. Each operator was allowed to serve his own clientele, and no confusion was noted. Under the threat of having coal confiscated, it was thought to be a better policy to allow the producer to serve his own trade. By this means the confusion that would follow should coal have been taken and placed in yards and plants unaccustomed to its use was avoided.

While there is no substantial stock of coal at any yard or plant, it is believed by those who have followed the matter closely that there is enough coal en route to this market (if a reasonable supply is allowed to continue) to keep all from suffering. Under such conditions as have prevailed for the past several weeks there is an occasional dealer that feels he is neglected. In reality, however, the trouble, when traced back, is found to be not the operator, but a result of failure to accept coal earlier in the season, prior to government control, allowing stocks to become depleted at a season of the year when all coal offered should have been accepted.

Operators and jobbers in this vicinity are considerably exercised over an order coming from Washington in reference to contracts. There is a suggestion that Dr. Garfield intends to abrogate all contracts, and that he will expect that all new contracts will be made by the use of a uniform blank. It is apparent from the reading of the new order that no contract will be allowed to pass that does not bear the official sanction of the fuel administration. It would appear that this should be entirely satisfactory to the trade in general, because the price is fixed by the Government, thereby doing away with the usual yearly practice of expensive negotiations for new contracts. Admittedly the fellow that has been on the level with his connections has nothing to fear, and will be in a position to claim a continuation of favors heretofore enjoyed.

Quotations in the Chicago market are as below, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, La Salle, Bureau and Will
Steam and domestic lump, egg, nut, stove, chestnut and pea	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50

MILWAUKEE

Fuel Administrator not responsible for an unauthorized advance. Wisconsin's coal supply protected.

The misunderstanding which resulted in an unauthorized raise of 25c. per ton in coal prices on Dec. 1, for which rebating is now in progress, was not due to any act of the fuel administration office, but was brought about on the strength of a report that President Wilson had requested coal operators to raise prices 35c. per ton.

As a result of the protest made by Gov. Philipp to Administrator Garfield, no more coal will be shipped to the Northwest from Lake Michigan docks. Minnesota and the Dakotas must depend upon the stocks at Duluth-Superior for their future supplies of fuel. It is also settled that Administrator Fitzgerald of Milwaukee will continue to direct the distribution of coal in Wisconsin. He has ordered all coal dealers in the state to report the amount of coal they have sold thus far during the present winter, together with an estimate of the amount they will require to supply consumers until spring. Inquiry is also made as to the extent to which coke and wood are being used.

ST. LOUIS

Car shortage somewhat severe. Transportation slow, but enough coal coming in from Standard district to take care of current needs. Fuel administrators have situation well in hand and future looks more optimistic than it has. No Eastern coals, and tonnage of Carterville exceedingly light.

The situation in the St. Louis market at the present time is exceptionally good. As a matter of fact, reports from all over the country show that St. Louis is in better shape for fuel than any other large city. There is some slight congestion in the terminals on the east side and also on one or two of the trunk lines on the west side, but in a general way the situation is extremely good.

Some coal from the Standard field is coming through to destination in St. Louis in three days.

The local demand, while it exceeds the supply, is nevertheless being taken care of in small quantities. The domestic consumer is in good shape and will continue to be unless there should be a prolonged and unusual siege of severe weather and even in that event Fuel Administrator Crossley expects to be able to handle the situation.

The situation throughout the state is far better than was anticipated two or three weeks ago. To those who criticized the measures taken, the results are surprising. Not only in the State of Missouri, but in Iowa, Nebraska, and Kansas there is coal as the result of Administrator Crossley's excellent work at St. Louis and Kansas City and his forbidding the railroads to confiscate coal without first getting permission. His measures have worked wonders in the local fuel situation.

There is no anthracite coming in to speak of and absolutely no smokeless. Arkansas is almost off of the market. The steam coal condition in and around St. Louis is not satisfactory on account of the failure of the users to get coal stored ahead, but there is no actual shortage that is preventing plants from running full time.

The prevailing circular is, per net ton f.o.b. mine:

	Williamson and Franklin Co.	Mt. Olive and Staunton	Standard
Prepared sizes, lump egg, Nos. 1, 2, 3 and 4 nut washed and unwashed	$2.65@2.80	$2.65@2.80	$2.65@2.80
Mine-run	2.40@2.55	2.40@2.55	2.40@2.55
Screenings and No. 5 nut washed and unwashed	2.15@2.30	2.15@2.30	2.15@2.30

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

SEATTLE

Government control of railroads to relieve coal shortage in northwest. May reclassify Washington coals, revise price at mines and declare embargo against Wyoming and Utah coals. Retail prices set in many cities.

Government control of railroads has already had its effect in the Northwest in the saving of fuel through the elimination of heavy passenger equipment from transcontinental lines. Now that the Government is in a position to force dealers to accept coal which will need a minimum of hauling, it is expected that eastern Washington and northern Idaho communities, which have insisted upon being served with Wyoming and Utah coal, will be served with western Washington coal, thereby releasing a number of cars.

Retail prices of coal in various cities of Washington have just been established the most important changes going into effect in Tacoma, where dealers are allowed a margin of $1 a ton over the mine price established for Pierce and King counties, together with freight and tax and delivery charges. Mine prices there are now $3.70 mine run, $4.95 prepared sizes and $3.45 for screenings. Zone delivery charges have been scheduled at from $1 a ton to $2.25, according to the distance of hauling. This would bring the cost of lump coal in Tacoma delivered at the consumer's door from $8.25 to $9.58, a higher price than has prevailed in the city in a number of years. The basis of figuring costs is as follows: Maximum cost, f.o.b. mine, $4.95; brokerage $0.15; freight and tax (from mines nearest to Tacoma freight is 66c. and tax 2c., total, $0.68); dealer's margin, $1, total, $7.28, to which must be added delivery charges of from $1 to $2.25. Retail prices at Everett are as follows: Black Diamond, prepared furnace, $6.95 to $7.45; Carbonado steam, $8.35 to $8.65; Carbonado lump, $9.55 to $10.05; Newcastle lump and nut, $8.30 to $8.80; Issaquah lump and nut, $7.85 to $8.80; Roslyn mine run, $7.45 to $7.95; Renton lump and nut, $7.90 to $8.65, Wellington lump, $9.70 to $10.20.

FOREIGN MARKETS

England

Coal—In the open market the volume of business passing is still negligible. Some improvement is discernible in demand for Admiralty descriptions.

	New Regulation Prices
Best Welsh steam coal	$8.62
Best seconds	8.27
Seconds	8.08
Best dry coal	7.89
Best Monmouthshires	7.89
Seconds	7.65
Best Cardiff smalls	6.19
Cargo smalls	5.47

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—There has been some slight improvement in the tonnage position.

Gibraltar	$24.30	Port Said	48.60
Marseilles	21.79	Las Palmas	20.02
Genoa	24.60	St. Vincent	20.64
Alexandria	42.50	River Plate	29.15
Naples	23.86		

Reported by Hull, Blyth & Co. of London and Cardiff, under date of Dec. 20, 1917.

CURRENT PRICES—MATERIALS & SUPPLIES

IRON AND STEEL

1- to 5-lb. cans	13.25	13.00	12.50	12.50	13.00		12.50	

CALCIUM CARBIDE—Price f.o.b. cars at warehouse points in Eastern [illegible] per ton for Union miners' lamp carbide, and $97.50 per [illegible] miners' lamp carbide. Union sells in 25-lb. cans for [illegible] per can.

COMMON BRICK—The prices per 1000 in cargo or carload lots are as follows:

Cincinnati	$13.50	Birmingham (clay)	$8.00
St. Louis, salmon	8.00	Birmingham (shale)	9.00
Denver	8.00		

FUEL OIL—Price variable, depending upon stock. New York quotations not available owing to this fact. In Chicago and St. Louis the following prices are quoted:

	Chicago	St. Louis
Domestic light, 22-26 Baumé	5½c.	7½c.
Mexican heavy, 12-14 Baumé	7c.	none

PREPARED ROOFINGS—Standard grade rubbered surface, complete with nails and cement, costs per square as follows in New York and Chicago:

	1-Ply		2-Ply		3-Ply	
	c.l.	c.c.l.	c.l.	l.c.l.	c.l.	l.c.l.
No. 1 grade	$1.15	$1.40	$1.45	$1.60	$1.75	$1.90
No. 2 grade	1.10	1.25	1.25	1.40	1.50	1.65

Asbestos asphalt-saturated felt (14 lb. per square) costs $6.50 per 100 lb.

Slate-surfaced roofing (red and green) in rolls of 108 sq.ft. costs $1.85 per roll in carload lots and $2.10 for smaller quantities.

Shingles, red and green slate finish, cost $4.75 per square in carloads, $5 in smaller quantities, in Philadelphia.

ROOFING MATERIALS—Prices per ton f.o.b. New York or Chicago:

	Carload Lots	Less Than Carload Lots
Tar felt (14 lb. per square of 100 sq.ft.)	$61.00	$62.00
Tar pitch (in 400-lb. bbl.)	15.00	16.50
Asphalt pitch (in barrels)	29.00	30.50
Asphalt felt	60.00	62.00

STEEL SHEET PILING—The following price is base per 100 lb. f.o.b. Pittsburgh, with a comparison of a month and a year ago:

Dec. 31, 1917	One Month Ago	One Year Ago
$4.50 to $5.00	$4.50 to $5.00	$2.60 to $2.70

HOLLOW TILE—The price per 1000 in carload lots f.o.b. mine is as follows:

	4 x 12 x 12	8 x 12 x 12
St. Louis	$79.00	$135.00

FREIGHT RATES—On finished steel products in the Pittsburgh district, including plates, structural shapes, merchant steel, bars, pipe fittings, plain and galvanized wire nails, rivets, spikes, bolts, flat sheets (except planished), chains, etc., the following freight rates are effective in cents per 100 lb.:

Boston	21.5	Minneapolis	35.5
Buffalo	11.6	New Orleans	30.7
Chicago	21.5	New York	19.5
Cincinnati	18.5	Pacific Coast (all rail)	90.0
Cleveland	13.5	Philadelphia	18.5
Denver	79.0	St. Louis	27.0
Kansas City	47.0	St. Paul	35.5

COAL AGE

Volume 13 NEW YORK, JANUARY 19, 1918 Number 3

Coal Mining Results in 1917 and Present Outlook

The production of coal in 1917 was the greatest in history.

The total output was..... 633,401,789 short tons

An increase of..... 43,303,614 " "
Or 7.3 per cent. over 1916.

ANTHRACITE production was..... 99,604,960 " "
Or 12,026,467 tons more than in 1916.

BITUMINOUS production was.....533,796,829 " "
Or 31,277,147 tons more than in 1916.

COKE output was..... 55,286,403 " "
Beehive coke decreased; byproduct coke increased.

YET THERE IS A SHORTAGE of fuel, particularly in the East. Where has the increased tonnage gone? Why is the situation so critical here in a country that contains only one-seventeenth of the world's population and still produces one-half of the world's fuel?

Of last year's record output only about two per cent. of the total production passed out of the country. We supplied almost nothing to our allies.

Due to increased efficiency in firing and less waste generally, several million tons were saved by domestic consumers. Absolutely no coal has gone into storage. Therefore, the only answer is that industrial activity in America in 1917 was far above normal, due to the demands of the war.

Consumers in the Northwest, or Lake regions, received about 3,000,000 more tons last fall than they did one year ago. The coal supply in the Eastern states has suffered as a consequence.

The railroads of the country took 15,000,000 tons more, the munition plants at least 10,000,000 tons more, and the Government consumed 6,000,000 tons more. The total of these requirements alone accounts for the disappearance of the greater part of the year's increase in output.

THE ANTHRACITE MINES accomplished wonderful results. In the face of a 16 per cent. labor shortage, the production of anthracite increased 12,000,000 short tons, or about 14 per cent. The Pennsylvania bituminous mines produced the same tonnage as in 1916, while West Virginia showed a decrease in output. Illinois recorded the largest production in its history and succeeded in replacing West Virginia as the second largest coal producer. Alabama, Ohio, Indiana, Colorado and most of the Western states showed increases. If the Eastern states could have worked more days, the fuel situation in Pennsylvania, New York and New England would not now be so serious.

All through the year transportation has been the point of attack. During the hottest days of the past summer the cry of the operators was for cars, not miners. There are sufficient mines and plenty of operating equipment, but these things are ineffective if there are no cars into which to load the coal. It is further true that the trouble is not so much car-shortage as it is inefficient car-service.

THIS COUNTRY has learned a lesson. We know now that our rich stores of coal are of no use unless they are in the bins of the consumer. We know that a man in the mines is as essential as a soldier in the trenches. We know now that if our Government were to assume control of all our coal mines, the Federal power over industry would be absolute and laws would be of little avail. We know also that the result of our present unpleasant experiences will be to relieve the nation's industries from a fuel shortage next winter, unless we have bunglers on the job.

The outlook for the year 1918, so far as the mining end is concerned, is extremely favorable. The Government must exempt miners from draft. The Federal railroad director must regulate so as to insure the immediate unloading of all cars. The miners' union must lift all restrictions that limit either hours or tonnage of the individual workman. If these things are done, the output in 1918 will cover all requirements, and the United States with plenty of fuel will bring the world war to a successful conclusion.

Activities in Different Coal-Producing States in 1917

THE following reports, written especially for this annual review number of *Coal Age*, were prepared in practically all cases by the chief coal-mine inspectors of the various states. There are also several supplementary reports which review briefly some of the high spots in the general development work of the industry during the year. The past twelve months has been the most momentous year in the history of coal mining. The unusual conditions were created by the World War into which this nation has been plunged. At the present time it is opportune to call attention to the desirability of having all reports of production expressed in net (short) tons. In some cases returns of output are given in long tons, and in other cases the short ton is used. It is also confusing to have the annual reports end at different periods. In some instances the reports are for the fiscal year ending June 30: other states end their fiscal year in October; while still other states cover the year up to Nov. 30. It would be much more satisfactory to all concerned if each and every report covered the calendar year. We suggest that the inspectors lend their efforts to bringing about such a standardization. One thing that stands out in the majority of the reports is that the tonnage produced over the entire country would have exceeded all expectations had the car supply been equal to the demand.

Alabama

By C. H. Nesbitt
Chief Mine Inspector, Birmingham, Ala.

TAKING into consideration the increase in 1916 over 1915, which amounted to 2,967,794 tons; that 199 mines were being operated in 1916, whereas in 1917 there were working about 297, and a greater number of coke ovens; recalling also the fact that the commercial coal market was inactive during 1916 until the last quarter, while the whole of 1917 showed great activity in all lines, notwithstanding interruptions in the way of a car shortage, and a temporary lull in mid-summer due to labor troubles; I do not think it excessive to approximate the production for 1917 at 21,000,000 tons, as against 18,234,625 in 1916.

C. H. Nesbitt

During 1917, the number of men killed in Alabama was 108; this is 10 less fatalities than in 1916.

Year's Developments in Alabama

By H. S. Geismer
Keiser-Geismer Engineering Co., Birmingham, Ala.

SEVERAL interesting facts stand out in reviewing the coal-mining industry in Alabama for 1917. First, a marked decrease in the tonnage produced by coal mines using convict labor, this being due to the fact that ever since Alabama adopted prohibition there has been a gradual falling off in the number of convictions by the courts. In consequence, many of the jails in Alabama are empty and few new arrivals are noted at the convict camps. This must not be interpreted to mean that prohibition has caused a decrease in the total coal tonnage produced, as quite the opposite is true.

Second, along the fringes of the coal-mining area where the coal seams come to the outcrop a large number of wagon mines have been opened, and the labor for these mines has been furnished to a large extent by the near-by farming communities. Farmers owning teams are contracting for the hauling of the coal, and their sons and laborers have gone to work as miners. Present indications are that this will affect the 1918 crops to a considerable extent in some localities, as the men who have gone to work at the mines are earning more than they can earn on the farms and it is doubtful if they will return to the farms in time to take care of the 1918 crop.

Third, several large stripping operations have been started, and if the present price of coal is maintained through 1918 quite a large tonnage will be produced by them.

Fourth, the Southern Railway Co. has begun development on a large tract of coal land and early in 1918 will be producing coal. This is the first mine in Alabama to be opened by a railroad company.

Strange as it may seem, the Alabama output for the last few months of 1917 has not been much affected by a shortage of labor, by price fixing, or by shortage of railroad cars, and the coal mines have been able to supply at least 95 per cent. of the demands of their regular customers in spite of the extraordinary demands of the railroads and the other customers. Most of the mines in the state are now producing about as large a tonnage as they can handle with the equipment they have. It is almost impossible to buy mining equipment with any definite promise of delivery, and in consequence most of the mining companies have not purchased the equipment necessary to an increased output.

The railroad car supply is said to be better in Alabama than in any coal-producing state of the Union with the possible exception of Virginia. This is due no doubt largely to the fact that the railroads take about one-fourth of the entire output of the state for their own consumption.

The shortage of coal at most of the domestic coal yards in the state has been the cause of much unfavorable comment from the newspapers, chiefly directed against the coal operators. In fact, this phase of the coal situation has practically monopolized the newspaper space set aside for the coal-mining industry.

How Alabama Output Is Divided

This shortage at the coal yards is easily explained, however. The output of coal in Alabama is divided about as follows: One-half the output is used by the coke- and iron-making corporations; one-fourth the output is used by the railroads, and the balance is divided between steam and domestic users. Most of the domestic coal is purchased by the consumers during a few months in the fall, while the production of domestic coal has to be distributed pretty well over the entire year.

In order to meet this condition, the coal yards generally begin to stock up in April and by fall have their yards filled with coal. This stock, with the daily shipments which they receive during the balance of the year, enables them to take care of the trade. This year, because of the high prices and the uncertainty of the market, few of the coal yards contracted for their normal requirements early in the year and, after waiting until the middle of the summer, found that the mines had sold their outputs and there was little coal to be had. The railroads were constantly increasing their coal con-

sumption—in fact most of them doubled their normal requirements—and this demand absorbed a great deal of the free coal that might have been available for the coal yards.

To make matters worse, the prices fixed by the Fuel Administration in the fall made it more profitable for the coal mines which had been producing lump and slack to sell their entire output on a run-of-mine basis, and for that reason even the amount of coal suitable for domestic purposes fell below the outputs of former years. Another factor in the domestic coal situation has been the withdrawal from the market of two steel companies which have found it necessary to use all the coal they could produce for gas-making purposes at their own plants.

Summary of Conditions

Summarizing the conditions for the year, three things may be said to have somewhat affected the possible outputs: First, early in the year there was a car shortage on two of the railroads serving the coal fields; second, about the middle of the summer the United Mine Workers of America attempted to organize all the camps, and for two months there was much unrest among the miners, which resulted in a noticeable reduction in outputs at many of the mines; third, during the last three months of the year some of the less thrifty among the miners and mine workers discovered that it was not necessary to work full time in order to make a living, and as a result many working places were idle two and three days a week. This condition has been found hard to cope with, and upon its successful solution depends in a measure the possibilities of increasing the coal output for 1918 over that of preceding years.

In order to take care of increased demands two of the large iron-making corporations had double-shifted their mines most of the year, and the results have been satisfactory.

Several coal companies which had produced their own electric power in the past contracted with the Alabama Power Co. for power during 1917. As the Alabama Power Co. produces its electricity by water power, this move has increased the available coal supply. Several mining companies which have not used electricity in the past have also contracted for electric power during the year; the number would undoubtedly have been larger if it had been possible to obtain deliveries on electrical equipment. As it is, the Alabama Power Co. has contracted for more power to coal-mining companies during 1917 than in the two previous years.

There has been considerable discussion about the quality of the coal produced, but it is doubtful if anyone has refused a car of coal because of its quality. This must not be taken to mean that such rejection could not have have been justified; on the contrary, rejections might often have been enforced, but poor coal is generally better than no coal.

The coke-producing companies who wash their coal before coking and who are thus able to check qualities have found that they have larger washer losses to contend with, and in a corresponding measure all consumers of coal undoubtedly have suffered from an increase of ash in their fuel; this is a condition that cannot be remedied so long as labor is scarce.

Judging by results in Alabama, it is doubtful if any of the rulings of the Fuel Administration have been of much assistance. Take the case of the wagon mines for example. It has been ruled that they cannot add the price of their hauling to the Government's fixed price unless their coal is delivered direct to a consumer, the idea being no doubt to encourage them to haul this coal to towns and cities and thus relieve the domestic situation. But since railroads are consumers (anxious consumers at that), and furthermore since railroads are generally near to these wagon mines, the railroads have been offered and have accepted practically all the wagon-mine coal.

Alaska

By Sumner S. Smith

Alaska Engineering Commission, Eska, Alaska

A GROWING activity in the Alaska coal fields and an increased production of approximately 500 per cent. over last year's output was witnessed in Alaska during the past year. A number of new operators produced small amounts of coal from ten-acre free-use permits, and many of the former operators greatly increased their outputs. Several leasing units in the Matanuska field have been leased and are now under exploration. In the Bering River field private interests have continued construction of a standard-gage road to their holdings on Canyon Creek and are reported to have the mine opened in such a manner that shipments can be started at an early date. The Matanuska branch of the Government railroad has been completed to Unit 12 on the Chickaloon River, with a spur 2.7 miles up Eska Creek and a preliminary survey on Moose Creek—some five miles to Units 2 and 3. Unit No. 12, in the Matanuska field, was withdrawn last year for the use of the Alaskan Engineering Commission, although work was not commenced at that point till this summer, owing to the difficulties of getting in supplies before the completion of that portion of the railroad. Unit 7 was leased early this spring to the Eska Creek Coal Co., which shipped 7783 tons, one-sixth of which went to the local market and the balance to the Alaskan Engineering Commission. As this corporation was not financially strong it transferred its holdings to the commission, which took over the property to insure a regular supply of fuel.

The largest producers from the ten-acre permits were the Doherty Coal Co., the Cache Creek Dredging Co. and John A. Herbert. The first produced about 19,500 tons, of which 500 was sold to the local trade in Anchorage and the balance to the commission. The second mined about 5000 tons, which was used during the active season on the company's dredge on Cache Creek. The last-named produced 4300 tons at Bluff Point, on Cook Inlet, which was sold to the canneries and towns along the Inlet. These figures are all in long tons. George Wallin, of Candle, mined about 500 tons on his ten-acre lease near that point. The commission produced approximately 18,500 short tons from the Eska Creek mine and 300 short tons from the Chickaloon property, which has been taken out in development work.

The total output from the entire territory probably closely approximates 60,000 tons, as there were some two dozen operators on the free-use ten-acre areas who mined small amounts for their own use.

In the Matanuska field a group of men headed by Henry Baxter, of Anchorage, has commenced development on Units 2 and 3, while another group has started work on Units 10 and 11 under the management of Lars Netland, of San Francisco.

Arkansas

By Robert Boyd, Jr.

State Mine Inspector, Fort Smith, Ark.

PRODUCTION of coal for the State of Arkansas for the year 1917 is about 1,867,802 short tons, of a value of $3,675,950. The number of producing mines in the state is 115, employing 5345 miners in all classes. The estimated value of the powder purchased by the miners in 1917 is $168,132.

Colorado

By A. R. Tibbits

Office of State Inspectors of Mines, Denver, Colo.

IN COMMON with that of the whole country the coal industry of Colorado has been under extraordinarily heavy pressure during the year 1917. With the increasingly insistent demands for enlarged output of the basic industries; with a scarcity of labor incident to war; with serious car shortage interfering with steadinesss of production and with constantly mounting wages and other costs, the situation has at times reached a critical stage in which the industry was saved from disaster only by the intelligent coöperation of operators and workmen.

Coal prices in Colorado were increased during 1917. Some increases were naturally necessary as a result of increasing costs of production. The following figures show the range of wholesale prices for the best grades of domestic coal, both lump and nut, now in effect at the mines in the southern

field, Routt County, and the northern field:

Southern Field

	Per Ton
Lump	$4.45
Nut	3.50

Routt County

	Per Ton
Lump and nut	$4.45
Slack	1.90
Mine-run	3.45

Prices for the best grades of lignite coal sold at the mines:

Northern Field

	Per Ton
Lump	$3.95
Slack	$1.00 and 1.70
Mine-run	2.75 and 2.90

The foregoing prices, effective Nov. 1, were authorized by the Government in consideration of a specified advance in wages, and are the maximum prices for which coal may be sold. However, the great bulk of the coal mined in these three districts is sold as steam coal at very much lower prices, specified by old contracts not expired and which cannot be violated. Some of the operators maintain that this 45c. advance in price was not equal to the increased cost of production.

JAMES DALRYMPLE
State Mine Inspector, Colorado

It has been the policy of the Colorado operators to encourage the storage of those grades of coal which could be kept without loss, thus equalizing the demand throughout the year and keeping the mines in operation. In furtherance of this policy the producers have made unusually low figures to retailers throughout the summer months.

TABLE SHOWING WAGE SCALE IN MINES OF THE NORTHERN FIELD AND ROUTT COUNTY, NOVEMBER, 1917

Northern Field

	Per Ton
Miner (Boulder and Weld Counties)	
Machine	$0.54
Pick	$0.69 to 75
	Per Day
Driver	$4.00
Timberman	4.00
Laborer	3.84

Routt County

	Per Ton
Miner, Pick	$0.75
	Per Day
Miner, Pick	$5.28
Driver	5.28
Timberman	5.28
Laborer	5.28

TABLE SHOWING COMPARATIVE WAGE SCALE IN COAL MINES OF THE SOUTHERN FIELD, JANUARY, 1917, AND NOVEMBER, 1917

	Wage Scale, January, 1917, Per Ton	Wage Scale, November, 1917, Per Ton	Per Cent. Increase Over January, 1917
Miner (Trinidad District)	$0.58	$0.78	$34.49
Miner (Walsen District)	.63	.83	31.75
Miner (Canon District)	$0.73 .78 .83	$0.99 1.04 1.09	$35.62 33.33 31.33
	Per Day	Per Day	
Driver	$3.25	$5.25	61.54
Timberman	3.30	5.30	60.66
Laborer	2.15	4.15	93.02

Wage increases throughout the year amounted in some cases to almost 100 per cent. The accompanying tables show wages paid coal miners and certain classes of day workmen in the three leading coal-mining districts of Colorado. Approximate wage scales are in effect in other parts of the state.

The Colorado Fuel and Iron Co. has had three successive wage advances during the year, which have been negotiated between the company officers and the miners' representatives under the provisions of the Industrial Representation Plan. In other instances the wage scale was amicably negotiated between the representatives of the companies and the United Mine Workers, or the wages were automatically advanced by companies negotiating only individually with their workmen.

November earnings at four of the largest southern Colorado mines showed that at the mines the average pay of all miners who worked full time was $174.33.

Many of the Colorado coal operators state that the increase in cost of production as a result of increasing prices of necessary supplies, many of which have advanced more than 100 per cent. (in some instances several hundred per cent.), has amounted to almost as much as the increase due to the advance of wages.

Numerous local strikes occurred at the coal camps, but none were serious and were speedily adjusted by the Colorado Industrial Commission.

The following table is a brief summary of the year's operations at the mines:

COAL PRODUCTION OF COLORADO BY COUNTIES FOR 1917

Counties	Total Production
Boulder	1,261,621
Delta	103,060
El Paso	366,920
Fremont	866,064
Garfield	108,180
Gunnison	647,070
Huerfano	2,355,751
Jackson	86,699
Jefferson	127,644
La Plata	126,789
Las Animas	4,449,743
Mesa	206,734
Moffat	500
Montezuma	998
Montrose	1,513
Pitkin	21,463
Rio Blanco	4,710
Routt	1,065,007
Weld	622,658
Total	12,433,129

There were many fatal accidents, the Hastings explosion alone cost the industry 121 men. This increase of loss of life may be attributed to several causes. Labor being scarce, the workmen feel their independence and pay little or no heed to the rules adopted at the mines for the protection of life and limb. The mine officials on the other hand, in order to keep up the maximum production, are afraid to enforce these rules by dismissal, knowing that any discharged employee can find immediate reëmployment at the next mine. Another cause that contributed largely to the increased rate of fatalities was prompted by the large earnings of the miners and other underground workers, inducing many men from other callings to enter the mines, and who, having no experience in coal mining, were unable to take care of themselves.

The average number of men employed in and about the mines in 1917 is 13,570, the total number of days worked per mine being 204.5.

The coal production of Colorado in 1917 was the largest ever produced in the state. In 1910 the tonnage reached 12,104,887 tons, which has not been exceeded until 1917. Had it not been for the car shortage and labor scarcity, the production would easily have reached the 13,500,000-ton mark.

Illinois

By Martin Bolt
Assistant Director, Department of Mines and Minerals, Springfield, Ill.

DURING the year 1917 the coal mines of Illinois will produce a larger tonnage than during any preceding year in the history of coal mining in the state. There are several reasons why the production of coal will be much greater, or should be greater, than in any preceding calendar year. The figures given must necessarily be estimated, because of the fact that the report of the Department of Mines and Minerals is for the fiscal year ending June 30, 1917.

There were 324 shipping mines in operation during the last fiscal year. Since the close of the fiscal year a number of mines have been reopened, and the number in operation at present will exceed the figures shown in the annual report for last year. This, together with the fact that the number of mine workers has materially increased during the last year, will surely give to Illinois the largest tonnage in its history.

The coal report for the year ending June 30, 1917, gives as the production for the months of January, February, March, April, May and June 42,550,693 tons. Taking the figures as a basis, and estimating that the number of mines in operation has increased, that the number of mine workers has shown an increase, that special effort has been made on the part of the railroad companies to supply cars in which to haul the coal, we feel reasonably safe in saying that the production of coal in

Illinois for the calendar year ending 1917 will be approximately 85,700,000 tons.

These figures do not indicate what the possibilities of coal production in Illinois are; with adequate car supply, labor supply and the equipment now in operation, it is safe to say that 125 million tons or more can easily be produced.

During a single month a number of years ago the production reached approximately 12,000,000 tons. What we need in Illinois is cars in which to load the coal, and we will do our part in supplying the necessary fuel to meet the demands at present and for the future.

We have the mines; we have the men; give us the cars and we will produce the coal.

Indiana

By Michael Scollard
State Mine Inspector, Indianapolis, Ind.

THE output of coal, and the mining industry in general in the State of Indiana during the fiscal year 1917, was much better than was expected at the beginning of the year. There was some time lost owing to the shortage of railroad cars and local strikes, notwithstanding which the total production from mines employing ten or more persons was 24,013,021 short tons. This is the greatest number of tons ever produced in a single year in this state from mines under the jurisdiction of this department.

The estimated production of stripping plants and of mines employing less than ten persons was 1,000,000 short tons, making a total of 25,013,021 short tons during the year. There are about 250 small mines in operation. The stripping system is used in this state where the overburden can be removed economically by steam shovels or other mechanical means, thus exposing the coal. There are ten of these plants in operation at the close of the fiscal year. From 14 to 40 ft. of overburden is removed from Nos. 3, 4 and 5 bituminous coal, which ranges from 5 to 7 ft. in thickness. The daily capacity of some of these plants is 800 tons; others produce from 2000 to 15,000 tons per month.

Of the coal produced, 23,567,414 tons was bituminous and 445,607 tons was block coal. This exceeds 1916 production by 5,774,430 tons. In the production of the coal there were 183 bituminous mines in operation and 20 block-coal mines, making a total of 203 mines under the jurisdiction of this department. The average number of days the mines were in operation were: Bituminous mines, 223 days; block-coal mines, 226 days. There were 705,306 kegs of black powder and 62,201 lb. of permissible powder used in producing this coal.

Of the bituminous coal produced, 13,140,495 tons was consumed in this state and 10,827,945 tons was shipped out of the state; 23,171 tons of block coal was consumed in the state and 422,446 tons was shipped to other states. The principal markets for Indiana coal are Chicago and Indianapolis. Owing to the great demand for coal, it was impossible to know the exact average selling price before the Government set a price on coal at the mine.

The average number of employees for the year in block-coal mines was 757, while the average numer of employees in bituminous mines was 23,163, which is an increase of 620 over last year. At the close of 1917, in all probability, there were 25,000 men engaged in the production of coal. The total wages reported is $23,567,937.75, making an average earning, per mine employee, of $985.60.

During the fiscal year ending Sept. 30, 1917, there were 27 new mines opened in the state. Fifteen of these were hand, or pick, mines and twelve were machine mines. Three of the pick mines were block-coal mines. These mines were all located in nine different counties.

There were five mines abandoned during the fiscal year, one in each of the following counties: Martin, Owen, Perry, Spencer and Warrick. The abandoned mines were all small producers.

There were 61 fatal accidents to persons employed in the mines and five fatal accidents to persons employed on the surface. The number of tons produced per fatality was 363,834. There was an average of 23,940 persons employed about the mines, which would be 2.75 killed per thousand employed. This fatality is greatly deplored by all parties connected with the mining industry.

Mining is one of the most hazardous employments and it is especially important that miners should know the dangers met with in coal mines. A surprisingly large number of fatal accidents occurs each year at the working faces of the mine, caused by falling slate. Many of these are caused by faults or slips in the roof which are hard to detect, while a large per cent. are caused by the lack of proper examination and timbering of the roof. In my opinion fatalities from this cause will not be greatly reduced until there is a law compelling more frequent examination of working places by the management and making it an offense for a miner not to timber his place properly.

Our present mining laws are inadequate for the mining industry of Indiana at this time. Mechanical processes employed in mining have been introduced more rapidly than the safety and precautionary measures necessary to safeguard the miners from the new and additional dangers to which these new processes expose them. Since the last revision of the law, for instance, electrical power for lighting and mining purposes, electrically driven machinery, etc., have been introduced extensively for mining and hauling purposes, which means more rapid transit of coal cars to shaft bottom. This involves the installation of high-power transmission wires throughout the haulage roads and entry ways, which, in many instances, are not more than 50 in. in height. These wires are not infrequently exposed for want of proper insulation and protection. Larger and wider cars are being used, mines are being sunk deeper, more gas is generated and much gas given off by "cave-ins" in mines. As a result, to the fatalities previously recorded from falling slate, premature blasts and asphyxiation have been added those of electrocution, crushed between sides of pillars and cars, burned by gas and caught by motor trips.

It is therefore hoped that the legislature will place on the statute books some laws that will state specifically the safeguards to be used to protect the workmen from the new and additional dangers.

The General Assembly of 1915 created a commission for the purpose of codifying the present mining laws. This commission also being authorized to recommend in its report such amendments and changes in the law as would, in its opinion, be conducive to the highest interests of safety in the mining industry in all its relations.

The commission was appointed, and consists of two representatives of the operators, two representatives of the miners and a mining engineer. They held several meetings at which they compiled a set of mining laws, which contained many recommendations to the legislature for passage. The report was signed by the entire commission and was referred to the Committee on Mines and Mining in the Senate. At a public hearing on the report, the miners' organization of District No. 11 and the representatives of the miners who were members of the commission

TONS OF COAL PRODUCED AND WAGES PAID TO MINERS IN INDIANA FOR THE YEAR ENDING SEPT. 30, 1917, BY COUNTIES, BLOCK AND BITUMINOUS COAL BEING SHOWN SEPARATELY

Counties	Block	Wages Paid	Bituminous	Wages Paid	Total Production	Total Wages
Vigo	120,718	$220,801.39	6,772,416	$6,630,163.97	6,893,134	$6,850,965.36

objected to its passage on the ground that many discrepancies had gotten into the report, and the report was indefinitely postponed in committee. As a result, there were no additional mining laws placed on the statute books in 1917.

Very few mining laws have been placed on the statute books within the last few years. As they now stand, they are inadequate for the present system of mining.

During the fiscal year there were 840 regular inspections made by the inspectors of the department, and written reports of the conditions of the mine and the recommendations made were filed with this office.

In addition to the regular inspection work, numerous calls have come to the department regarding dangerous conditions existing in the various mines. Chief among these were complaints regarding scales, ventilation, failure to provide washhouses, complaints regarding the dangerous condition of cages, the system of handling explosives and the like. All these calls were given prompt attention by our inspectors.

Accidents Carefully Investigated

Sixty-six fatal accidents were investigated during the fiscal year. Conditions of that section of the mine and places where accidents occurred were carefully noted, and the evidence taken at such investigations has been filed with this office. Numerous serious and slight accidents have been investigated on the regular inspection tours, and recommendations made with the view of preventing accidents from recurring in the same manner.

Many special inspections were made of mines where gas is likely to accumulate in abandoned workings, caused by squeezes and cave-ins. Mines whose workings are approaching old abandoned mines, which contain large accumulations of gas and water, are given special attention. Escape shafts, ventilation apparatus and the like are all carefully inspected. Large mines where gas and damps are generated are visited more frequently than mines where those dangers do not exist.

Days are spent by mine inspectors in abandoned workings in mines, climbing over falls of roof and over cave-ins, where accessible, for the purpose of ascertaining if gas has accumulated in the cavities above, which would be forced out into the workings by additional caves and be ignited by an open light and cause a disaster. Other hazardous duties of the inspectors are exploring mines after explosions, as members of the rescue parties, examining mine for fire before the ventilation is fully restored after explosions, and assisting in controlling mine fires. These are additional duties to the regular inspection work, which is that of seeing that the mining laws are complied with and the health and safety of the persons employed in the mines assured.

The movement for prevention of accidents and knowing how to protect one's self from the dangers met with in coal mines is finding favor with the miners and operators in this state, and is encouraged by the Industrial Board of Indiana. This was demonstrated at an explosion which occurred at the Oliphant-Johnson mine in Knox County on Dec. 19, 1916, when two persons were killed, 28 were seriously burned and two died in a few days from the effects of their burns. Sixty-five miners, who were working in a section of the mine that was not seriously affected by the explosion, discovered that their escape to the surface was cut off by hot gases and afterdamps. They retreated into a pair of entries, and using what material was at hand they sealed the entries off from the rest of the mine workings, preventing the gases from getting to them, thereby saving their lives. A few hours later they were located by a rescue party and were taken to the surface in safety.

Many first-aid and rescue teams have been organized in the mining districts, many of which have been trained by the Federal Bureau of Mines in the use of oxygen apparatus, which is of great assistance in exploring mines after explosions and in overcoming fires in the mines.

Iowa

By L. E. Stamm
Secretary, Iowa Mine Inspectors,
Des Moines, Iowa

THE year 1917 differs but little from previous years in so far as certain statistics relating to the coal industry of this state are concerned. The number of employees, the number of mines in the state and the tonnage mined varies slightly from year to year, each year usually showing a slight gain over the one preceding.

The greatest demand for the product of the Iowa mines comes during the winter months. In fact, many of the smaller local mines in the state cease to operate about Apr. 1 of each year and then resume operations about Aug. 1. In this way they operate only when there is a demand for their product. The larger mines supplying the railroad trade of the state, as well as selling coal to the commercial trade, continue to operate the entire year through. The work is hardly as steady during the months of May, June and July as in other months, as there is but little demand for commercial coal in these months and the mines hardly put in full time.

These conditions prevailing have resulted in something over 7,000,000 tons of coal being produced in this state from year to year. The number of employees varies but little, usually about 16,000 men being given employment in and around the mines of the state.

Iowa's neighbor state, Illinois, producing almost eight times as much coal, has been looking to the Iowa field to consume a part of her production. The result has been that for a number of years, up to the latter part of 1916, all northern and eastern Iowa has for the most part been supplied with coal from the Illinois field. This has not been favorable to a large production of Iowa coal.

Car Shortage Curtails Supply

During the latter part of 1916 and first part of 1917 a car shortage prevailed and not quite so much foreign coal came into Iowa, and Iowa coal again came into demand in the northern and eastern parts of the state. Following the car shortage of the winter of 1916-17 came a demand for coal at Eastern points caused by war conditions. This caused coal from the Central States to be diverted eastward, and this has been a decided advantage to Iowa coal producers. Conditions, therefore, were fairly good in the mines of Iowa during April, May and June of the year 1917.

This state would no doubt have continued had it not been for the agitation started in regard to the price for Iowa coal, together with articles appearing in the papers stating that the President would set the price for Iowa coal at the mines considerably lower than that which prevailed at the mines in May and June. All this talk of lower prices had a depressing effect on the industry, so much so that many dealers in the state refused to lay in their usual stocks anticipating a much lower price. The result was that many of the larger mines sold practically no coal at all to the commercial trade during the month of July and first part of the month of August, just when conditions of the trade should have been at their best. In the latter part of August the price of Iowa coal at the mines was fixed by the President, and immediately thereafter orders almost swamped the mining companies of the state. Since that time there has been a steady production and demand.

Coal Business Unsettled

However, during the year 1917, the coal business of Iowa has been more or less unsettled. First the miners felt that the agreement entered into in April, 1916, for two years did not cover the increased cost of living which had come about on account of war conditions, and they asked that a supplementary agreement be entered into that would give them a higher wage in the coal production. This was agreed to by the operators of the state, and the raise given the day laborers in the mines approximated 20 per cent., while 10c. per ton was added for the miner. Cost of living still continued to advance, and the miners asked for and were granted another increase following the Washington agreement in October, which added $1.40 per day to the wages of the day laborers in the mines and an additional 10c. per ton to the miner in addition to increased pay for deadwork.

Prices asked for Iowa coal advanced considerably during the year 1917, and a feeling prevailed that the price asked for Iowa coal was too high. Many com-

plaints as to prices of coal came to the Governor of Iowa and to the mayors, especially of the larger cities in the state. The result of this was that the Governor called a hearing on the coal situation and asked for the operators' cost of production, dealers' cost of operation, information as to the daily production of coal and its distribution, and as to the amount of coal on hand in the various cities and towns of the state.

The hearing was adjourned twice and took up three days' time, and developed that there was no substantial shortage of cars to handle the production at the mines. It showed that the mines of the state were operating at their full capacity so far as conditions would permit. It showed that the miners and other laborers at the mines are coöperating in every way to increase the production at the mines. Reports were received at this hearing from 361 municipalities. Only three reported normal conditions as to a supply of fuel; 73 reported conditions as good; 159 reported conditions as bad, and 126 reported conditions as serious. These related to the fuel supplies in each place reporting the amount of coal on hand, the amount ordered and the demand. The places reporting the conditions as serious stated that the city or town reporting had on hand enough coal to last but three or four days with nothing in sight to relieve the situation. Others reported as bad showed enough coal on hand to last from one to two weeks. The hearing was conducted before Governor Harding and three mayors representing the League of Iowa Municipalities. This information will no doubt be of considerable value to the Fuel Administrator of Iowa and will enable him to care better for the fuel situation as existing at the present time.

Iowa is not able at present to produce all the coal consumed within the state. Approximately 7,500,000 tons of coal is produced annually by the mines of the state. Of this amount about 4,000,000 tons or more are used by the railroads operating within the state, and a small part of the production of the mines is shipped to other states. To supply the necessary needs, Government reports state that something over 4,000,000 tons of coal is shipped into Iowa from other coal-producing states, making the annual consumption of coal within this state for railroads, manufacturing industries and domestic use approximately 11,500,000 tons per year. It can thus be seen that if no Iowa coal was taken by the railroads of the state that the Iowa coal mines could supply every other need for coal in Iowa at the present time.

Under a change in the law the Iowa Mine Inspectors' office now gathers statistical information relating to the Iowa coal industry for a calendar year ending Dec. 31. Blanks for reports are sent to all companies on Jan. 1 of each year, and these blanks are usually returned and ready for tabulation about Feb. 1 of each year, so I am therefore not able to give anything but approximate figures on the coal production for the year 1917, and can only make a comparison with the figures as compiled for 1916.

The statistics on file in this office for 1916 show a production of 7,217,969 tons of coal produced for that year. There was a slight falling off in the number of employees, the reports showing but an average of 15,195 employees in and around the mines for that year. Shipping mines operated on an average of 211 days during the year, while local mines operated on an average of but 143 days during the year. Total gross earnings of all employees in and around the mines for 1916 was $10,259,008.95. There were 283,004 kegs of black powder used in the Iowa mines in 1916, and 149,168 pounds of dynamite used in mining coal in that year. Reports show 52 mining machines in use in Iowa in 1916. About the usual number of fatal and nonfatal accidents were reported for the year. No serious labor troubles occurred in the mines during the year, and none so far in the year 1917.

The production, employees, etc., for the year 1917 can only be forecast from reports of 1916 and from conditions existing at the mines during the year, but my best judgment would be that the final figures when received from the mines will show a decided increase in both the tonnage for the year and in the number of persons employed in the industry. I believe the production for 1917 will total better than 7,500,000 for the year and the employees this year should exceed 17,000. Work at the mines is exceptionally good for the time of year; in fact, the fall and winter months of 1917 have been better than for many years. I understand there are no large stocks of coal on hand at any place in the state, and it looks now as if the mines would have a steady production for some time to come. I also look for a good year in coal production in 1918.

Kansas

By Fred Green
State Mine Inspector, Pittsburg, Kan.

KANSAS, like all other states of the Union, has made an unprecedented record, in the coal-mining industry of the state. Even before entering into the war against Germany the demand for fuel was so great that every resource of the state's mining wealth was brought into action. Our production possibilities are about 12,000,000 tons of coal per annum, at the present time, but owing to the lack of transportation facilities, including engine equipment and coal cars, our production from the mines in 1917 has been only about 7,500,000 tons, this being an increase over the year 1916, however, of three quarters of a million tons.

The steam-shovel system of mining has become an important factor in the mining industry of this state, and about one-fourth of the coal production is obtained from that source. Three of the largest steam shovels in the world are used in the coal fields of southeastern Kansas, extracting the coal from its deposit where the overburden is not sufficient to permit of deep mines working successfully.

Cherokee County, the southern county of the Kansas coal field, has been working continually for 40 years in a sort of haphazard way, and the consequence is that a very large part of the coal has been left in the ground in the form of pillars. Numberless mines were worked out, leaving these large pillars of coal, as the profit to be obtained was not sufficient when the mines were being operated to take extraordinary risk this line of work requires. However, there have developed during the year more than 100 small shafts, sunk almost exclusively on pillars that were left behind when the coal industry was not so profitable as it is at this time.

Proper Timbering Means Safety

One might look with awe on these little box-like tipples, wondering where the miner would find a way of escape if the main shaft should give way or cave in, but upon investigation the Mine Inspection Department of the State of Kansas finds these little places to be interlocked with each other, and that one "hole," or shaft, becomes an escape shaft for the other. On the whole, with proper timbering, the condition is about as safe as in the developing mines in the northern part of the field.

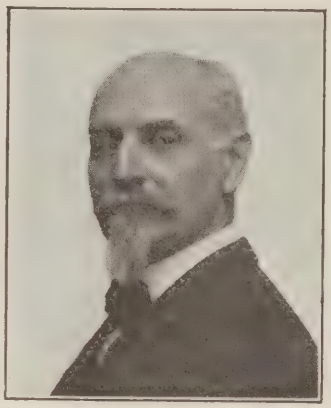
In the Crawford County district the depth to the coal seam runs from 100 to 250 ft. The undeveloped part of the field seems to be deeper. After reaching a depth of 100 ft., we find marsh gas generating from the coal seams in more or less quantities, and, until this winter, many shotfirers have lost their lives by explosions caused from accumulation of gas through insufficient ventilation, dusty roads, carelessly stored away powder and badly prepared shots. The officers of the Mine Inspection Department have been spending their energies to remedy these conditions, together with requiring the management of these "gassy" mines to heat and humidify the air current by exhaust steam pipes, sprinkling the gob walls and salting during the cold season. As a result not a shotfirer has lost his life this winter from that cause.

A great future is in store for the coal industry of this state, and if Uncle Sam succeeds in keeping empty cars at the mines I predict that next year will be far the greatest year in the production of coal that southwestern Kansas has ever known.

Rescue and first-aid work in this state are assuming larger proportions than ever before, and at the last session of the legislature of this state it was made possible to obtain adequate equipment for three rescue stations in the main coal fields of the state, in southeastern Kansas; and the state mine inspec-

tor of the State of Kansas was appointed ex-officio superintendent in charge of all the rescue stations. The law provided for a central station at Pittsburg, Kan.; a substation at Arma, Kan., and a substation at Scammon, Kan. Joseph F. Davies, formerly in charge of Government Rescue Car No. 4, stationed at Pittsburg, is superintendent in charge of the central rescue station, and William H. Jones and Robert Laws are in charge of the Arma and Scammon stations, respectively. All these men have established a good record for themselves in this field in rescue and first-aid work. While all the rescue stations are not fully equipped at this time, the State of Kansas is making rapid strides toward safety, first-aid and rescue work for the benefit of her thousands of coal miners.

Certification of Mine Officials



A law was also passed at the last legislature providing for the certification of shotfirers, hoisting engineers, gasmen and firebosses, assistant mine foremen and mine foremen, and providing a board, known as the "Mining Examining Board," for the examination of persons employed in such vocations. The law provides for the revocation of a certificate for intoxication, mental disability, neglect of duty or other sufficient cause when the case is properly proved before the examining board. It is thought that this will bring about a higher standard of efficiency among the miners and cause them to use a greater amount of care in the performance of their respective duties, and thus make for the safety of the men who work in the mines.

Kentucky

By C. J. Norwood
Chief of Department of Mines, Lexington, Ky.

CONDITIONS involved in Federal control of coal production have caused some confusion as to making monthly reports to the State Department of Mines, therefore it has been more than usually difficult to make a satisfactory estimate of the yearly output so soon after the close of the year. The figures for output actually reported up to December, together with estimates for December and for such preceding months for which certain operators are still delinquent, indicate an output of slightly more than 26,000,000 tons. The tonnage actually reported for the eleven months' period is nearly 23,000,000 tons. The indicated production was as follows: By western district, 9,458,302 tons, of which 995,360 tons is estimated; southeastern district, 5,804,023 tons, of which 723,224 tons is estimated; by northeastern district, 10,862,685 tons, of which 1,574,276 tons is estimated, making a total of 26,125,010 tons. Had the car supply been adequate, the output would readily have exceeded 30,000,000 tons.

The production of the western field was affected by car shortage, but not so much as that of the eastern. In the northeastern district of the eastern field the car shortage held production about 25 per cent. below what it would have been in this district. Two companies alone report a loss of more than 1,500,000 tons due to car shortage. This field also had to contend with a labor shortage amounting to about 25 per cent. in localities, but this was due rather to the continued car shortage than to inability to procure men. If steady work could be maintained the production of the southeastern district of the same field was apparently more than a million tons less than for the

C. J. Norwood

preceding year. This was due in part to a shutdown caused by a strike of two months' duration in the early fall, which was chiefly to enforce recognition of the union, but partly for the eight-hour day and further wage increases, and in considerable part due to the excessive car shortage.

A large increase in the number of new developments in the eastern field affected the average labor supply through a process of division, even though the number of miners and laborers in this field exceeded that of past years. The general opinion is that sufficient labor for each operation could have been procured had the car supply been sufficient.

Fixed Prices Retard Production

The scale of prices as at first fixed by the Federal Fuel Administrator also somewhat retarded production in parts of the eastern field for a while because of confusion in classification of coal, and questions as to its application throughout the field have generally been adjusted. Use of local names instead of thickness and physical conditions for coals is still producing some confusion.

In consequence of 62 deaths in one explosion in Webster County, the mine-fatality record far exceeds any of the past; the State Department of Mines is badly handicapped through lack of sufficient number of inspectors and accidents are increasing. Not less than three more inspectors and better salaries to hold competent men are greatly needed.

Maryland

By John L. Casey
Mine Inspector for Allegany and Garrett Counties, Maryland

THE following table gives a concise summary of the mine-accident record at the different mines in Maryland during the year 1917:

Number of men underground	4,700
Number of men on surface	900
Foreman and clerical force	300
Total	5,900

The number of men killed during 1917 and the causes for the accidents are as follows:

Fall of roof coal	2
Fall of rashings	2
Fall of roof rock	4
Fall of middle rock	2
Fall of draw rock	1
Fall of bone coal	1
Caught while tunneling	1
Caught between cage and timber	1
Caught between motor and roof	1
Run over by loaded car	2
Jumped from runaway trip	1
Caught with rock shot	1
Electricity	1
Total	20

The following tabulation shows the companies at whose mines fatal accidents occurred during the year and the number:

Barton Mining Co	1
Blaine Mining Co	1
Piedmont & Georges Creek Co	2
McNitt Big Vein Co	1
New York Mining Co	1
Davis Coal and Coke Co	2
Hamill Coal and Coke Co	1
Maryland & Georges Creek Co	1
Consolidation Coal Co	3
Frostburg Big Vein Co	1
Georges Creek Co	1
Mt. Savage & Georges Creek Co	1
Garrett County Mining Co	1
Ajax & Hocking Co	1
Standard Coal Co	1
Fitzpatrick Coal Co	1
Total	20

This makes a total of 13 accidents for Allegany County and 7 for Garret. In Allegany County are 39 companies operating 130 coal mines, while 18 companies in Garrett County operate 40 coal mines. During the year 18 new companies were organized and commenced shipping coal. The estimated tonnage for 1917 is 4,000,000 tons.

Michigan

By Duncan A. Read
State Mine Inspector, Lansing, Mich.

FOR the fiscal year ending Nov. 30, 1917, the number of tons of coal mined in the State of Michigan was 1,308,947. The average number of men employed each month was 2128.

Missouri

By J. Goldman
Secretary Bureau of Mines and Mine Inspector, Jefferson, Mo.

MISSOURI broke the records in 1917 in coal production. The demand for fuel has been greater than ever before in the history of the state. Notwithstanding the great demand there has been little shortage for the general consumers and

practically none for the manufacturing concerns.

There were no strikes in this state, and the miners were constantly employed during the year at wages both satisfactory to them and to the employers. G. W. Hill, chief mine inspector, was highly commended by the Governor for the efficient manner in which inspections were made. Mr. Hill was reappointed by the Governor in May and immediately surrounded himself with intelligent and practical miners. With this splendid force the miners were safeguarded in their work and at all times were well pleased with their surroundings.

In view of the fact that over 5,000,000 tons of coal was mined in 1917, there were only 13 fatal accidents, about one accident to every 400,000 tons of coal mined. This is a splendid record, and, of course, is due to the excellent condition in which the mines were kept under the supervision of Mr. Hill and his corps of efficient assistants.

Montana

By John Sanderson
State Mine Inspector, Helena, Mont.

THE end of the fiscal year in the coal department has been changed from Oct. 31 to June 30. Under these circumstances I can only assume an approximate output for the state beginning with July 1, 1917, there being no figures available since that date.

The coal production for this state for the eight months beginning Nov. 1, 1916, and ending June 30, 1917, was 2,903,926 tons, therefore basing the output for the year on these figures, it is safe to assume that the total production will be about 4,400,000 tons. The production of coal for Montana will exceed by several thousand tons the output of 1916, which was the banner year in this state in point of production. There has been a marked increase in the demand for coal over former years, and although there have been a few complaints of a scarcity in some places, on investigation it has been found that these conditions have been local, and the situation has been relieved at once. The increased demand for coal, along with the price as fixed by the United States Fuel Administrator, has been a factor in causing very many new mines to be opened up in the state, in some cases located from 5 to 30 miles away from a railroad.

John Sanderson

While the production from these mines is not noticed along the line of the railroad, still they are the means of keeping the residents in their respective districts supplied with coal, where otherwise they would be compelled to get their fuel supply from dealers in towns on the railroad. Most of these mines are opening up in the eastern part of the state, in lignite coal, which lies near the surface, and the cost of opening up is not high. These mines generally employ from two up to as high as ten miners.

There has been some shortage of cars in the several coal fields of the state, but, taken altogether, the supply has been fair. The labor situation among the coal miners of the state during the year has been fair, there having been little labor trouble, and that of a local nature. The worst of the labor troubles took place at the mine of the Republic Coal Co., located at Klein, Musselshell County, where the miners were on strike for about seven weeks, which curtailed the output to the extent of about 100,000 tons. Several new mines have been put into operation during the year, some of which, when producing to their full capacity, will add quite an increase to the present output of the state.

The railroad mines—namely, the North Western Improvement Co., located at Red Lodge, the Republic Coal Co., located at Klein, and the Cottonwood Coal Co., located at Stockett and Lehigh—do not enter the commercial market whatever, their entire output being consumed by the various railroads.

New Mexico

By W. W. Risdon
State Mine Inspector, Albuquerque, N. M.

THE fiscal year in New Mexico is from Nov. 1 to Oct. 31 of the succeeding year. Hence this report covers the period from Nov. 1, 1916, to Oct. 31, 1917. The total tonnage for the fiscal year amounted to 4,113,544 tons: Anthracite, 46,613 tons; bituminous, 3,375,098 tons; semi-bituminous, 691,833 tons. Approximate value, $8,227,988. About 46,899 tons was used in operating the mines; 1,049,102 tons was used in making coke; 3,917,543 tons was sold in the markets of Kansas, Oklahoma, Texas, New Mexico, Arizona, California and Mexico.

Number of men employed at the mines were: Miners, 3163; daymen in the mines, 1244; boys in the mines, 67; daymen on top, 983; boys on top, 48. Total number of men and boys employed at the mines, 5505. Number of men employed in making coke, 397. Number of coke ovens, 1157. Tons of coke manufactured, 561,112. Approximate value of coke made, $2,525,000.

There were twelve fatal accidents in the mines during the fiscal year. This is charging the industry with one man found dead in the mine—who in all probability died of heart failure—and two men who died in the hospital some 30 hours after being injured in the mine by a fall of top coal.

W. W. Risdon

While the year 1917 shows an increase of 220,359 tons of coal over the year 1916, the production for 1917 was curtailed by strikes and shortage of miners. A strike at the mines of the Gallup-American Coal Co. caused a loss in the production from the Gallup district of at least 100,000 tons of coal. The strike was called on the first day of July. The demand was for recognition of the union. While the strike was called only against the mines operated by the Gallup-American Coal Co., the other mines in the district were affected by the disturbance of working conditions at their mines.

From records kept at the mines of the large companies of the men at work each day, the miners employed in the mines in this state are working a little over half time. In making this statement I am figuring full time as being 8 hours at the working face six days per week. From the best information I am able to get, 25 to 33 per cent. of the miners are off every day in the year, and in no case do they work 8 hours at the face. The daily average falls below 6 hours at the working face. The net result is about 56 per cent. efficiency for the coal miner in New Mexico.

Colfax County is the principal producer of the state. Two companies—the St. Louis, Rocky Mountain & Pacific Co. and the Phelps-Ddoge Corporation—produced 3,203,181 tons of coal and made 561,112 tons of coke. Each of these companies is opening new mines which are expected to be big producers. Over $250,000 have been spent by these companies this year for improvements and additions to equipment.

During the year the Diamond Coal Co. opened a new mine in McKinley County. This company has spent over $250,000 in building a power plant, new

buildings and the electrification of the old mine. The Gallup-American is figuring on extensive developments during the coming year and in all probability McKinley County can be counted on for a big increase in production.

New Mexico has a large area of workable coal seams, and if the demand for coal continues to be as great as it was for the year 1917 there can be no doubt that some large producing mines will be opened.

North Dakota

By J. W. Bliss
State Engineer, Bismarck, N. D.

FOR the year just closed, the production of lignite coal in North Dakota was about 20 per cent. greater than for the previous year. Transportation difficulties, as well as increased demands for anthracite and bituminous coals, have produced a serious shortage; and in many localities in the state where these coals were formerly sold they cannot be secured at the present time, or if available at all, they can be had only in such small amounts that, with the irregular supply, the average citizen does not feel secure. As a result, in thousands of homes in the state lignite is being used for the first time, and with a degree of success which indicates that even after normal conditions are restored a tremendously increased demand for the native coal will exist. Practically all the power plants in the state are now using lignite, finding it economical to do so.

About 689,000 tons of lignite was produced during the year, valued at $2 a ton at the mine. An average of 1115 men was employed during the winter months, of whom 757 are classified as miners and 358 were employed in other capacities. An average of 632 men was employed during the summer months,

J. W. Bliss

of whom 388 are classified as miners and 244 were employed in other capacities.

There have been but three fatalities, an average of 0.45 per hundred thousand tons of production, or 0.35 per cent. of the average number of men employed. The few fatalities and accidents are due to the fact that the lignite mines of this state produce no explosive gases, and with the exception of a few localities the roof materials are substantial.

Labor has been scarce, and there have been two small strikes; but these being of short duration, they had no appreciable effect on the production.

The State School of Mines, which has been experimenting for a number of years with the problems of briquetting lignite, has been making very satisfactory progress. These experiments indicate that commercial briquetting, under circumstances permitting of the utilization of all the byproducts, will result in a rapid development of the immense beds of lignite which underlie the western half of the state.

South Dakota

By O. E. Ellerman
State Mine Inspector, Lead, S. D.

THE coal-mining industry of South Dakota remains inactive, and as a coal producer the state has gained but little prominence. The total output for the year 1917 was 10,848 tons, and this seems to be an approximate annual average for the past number of years. Nearly the entire production is used as a local fuel by the farmers and ranchmen.

The lignite field comprises areas in Harding, Perkins, Dewey and Meade Counties, with negligible quantities in the adjacent territory. The districts mentioned lie north and east of the Black Hills, the metal mining section of the state, where the mines and quarries produce annually mineral weath valued at $8,000,000. The product from the coal mines for the past year had a value, at the mine, of $25,268. The industry gave employment to 110 men for an average of 150 days.

The mining industry in the Black Hills region gives employment to upward of 3000 persons for over 300 days in each year, and South Dakota ranks fifth among the states of the Union in the production of gold. In addition to this, gradual increases are made annually in producing tungsten, lead, silver, mica, tin, copper, gypsum and numerous other minerals of less value. The production of coal remains the same with no new developments or advancement in output. There are, however, reasons why a state that has deposits estimated at over a billion tons of minable coal cannot show a larger annual tonnage.

The backwardness in making use of local fuel is due directly to the following: First, the distance from railroad and lack of transportation facilities. Second, the grade of the coal, which readily disintegrates upon exposure to the air and for that reason cannot be transported any great distance This no doubt has a tendency to retard exploitation.

To commercialize this natural resource it will be necessary to have near railroad connections and to install plants for the briquetting of the lignite. A plant at the Scranton mine, just over the border in North Dakota, was placed in commission this past year and has proved that the coal can be briquetted without a binder. It is a success, and the entire output of 75 tons daily has found a ready market. The demand

O. E. Ellerman

has been so great that additions are being made which will give a capacity of several hundred tons.

It is claimed for the briquet that it affords a more economical fuel, both with respect to cost and heat value than the coals shipped into the state. The grade of the coal at the North Dakota mine is the same as that of our state, and tests made on some of the local material assures as good a briquet. Already some of the operators are making arrangements for the installation of treatment plants, and it is probable that within a few years' time the annual production will be noticeably increased. Even with the satisfactory solution by briquetting there remains one drawback, for until we have an outlet to market South Dakota will not make rapid strides in the increased production of coal.

The State Legislature of 1917 passed a resolution authorizing the appointment, by the Governor, of a commission to investigate the coal deposits on state-owned coal lands. This commission has been named, and during the year will make a report on its findings. It is hoped that the investigations will reveal deposits that warrant development on a large scale of a fuel that is sufficient to supply the needs of the state for a number of years to come. There were no acidents recorded to employees of the coal companies.

Ohio

By L. D. Devore
Chief Deputy and Safety Commissioner of Mines, Columbus, Ohio

FROM reports received from the coal-producing districts of Ohio, the tonnage will show a decided increase over the year 1916, the amount being estimated at 38,000,000 tons, or an increase of 10 per cent.

Not for years was there such a scarcity of railroad cars reported, upon

which the coal industry depends so much to move the tonnage. All mining districts reported the tonnage to have been from 25 to 30 per cent. less, due to this cause. While the question of the supply and demand of railroad cars is always a perplexing problem of the coal industry during certain portions of the year, the year 1917 experienced unusual abnormal industrial conditions not met with in former years, and were in the main responsible for this situation. The "Priority Act" promulgated by the United States Coal Administrator, which diverted all coal to the Northwest until the close of the Lake season, which was unusually late in closing this year, also had its effect upon the situation. Reports seem to indicate that the Eastern Ohio District suffered more from the lack of cars than the Hocking Valley District.

Lake Shipments Were High

Lake shipments of coal for the year 1917, from all reports, seem to have exceeded all other years in point of tonnage, and has furnished a ready market regardless of quality; the demand was also greater than transportation facilities afforded.

During the forepart of the year there seems to have been a scarcity of labor in the coal mines of the state; these conditions changed, however, when the price of labor increased from $3.60 to $5 per day. Labor was also robbed of much of the fruits of the year's prosperity in the increased wages granted by the operators due to the lack of an adequate supply of railroad cars. The scarcity of labor in some instances has affected the efficient operation of some of the mines, but did not materially affect the production.

No serious labor troubles were experienced during the year, and the Ohio miners as an organization have shown a patriotic spirit in responding to all demands made upon them by the unusual conditions met with in the year 1917.

The time reported worked in the various mining districts varies from 60 to 75 per cent.; the greatest loss of time occurred in the months of November and December, when the car situation became so acute, and this condition still obtains at the close of the year.

The output of Belmont County has been estimated at 12,000,000 tons, an increase of 2,000,000 tons; this may not be realized when accurate statistics are received as the car shortage was keenly felt in this district the latter months of the year. Athens County has an estimated tonnage of 4,700,000 tons, an increase of 1,000,000 tons; Jefferson County 6,000,000 tons, an increase of 600,000 tons; Perry County 2,000,000 tons, an increase of 800,000 tons.

Taking into consideration the unusual conditions entering into the coal situation for the year 1917, the total number of fatalities reported is not abnormal as compared with the year 1916, 113 having been reported, an increase of 5, or 4.6 per cent., as compared with the number reported for the previous year, when 108 were reported.

Belmont County reported the greatest number of fatalities, 32 in all, a decrease of 1 as compared with the year 1916; Jefferson County 18, a gain of 4; Guernsey County 15, a gain of 2; Athens County 12, a gain of 2. Jackson and Meigs Counties show losses of 3 accidents each, and Harrison and Carroll Counties a loss of 2 each. Lawrence County, which in the year 1916 reported 4 fatalities, reported none for this year.

Falls of roof caused the death of 65 persons, an increase of 2 over the year 1916; falls of coal show a loss of 3, two being reported; mine cars 21, an increase of 2; motors 3, a loss of 3; electricity 4, a decrease of 1; explosions of powder 4, an increase of 1; due to miscellaneous causes, 10 deaths were reported.

The outstanding feature of the coal industry for the year 1917 was the number of new operations reported to the department. The demand for coal and the attractive prices offered for it was productive of this condition. These operations have been reported from all twelve mining districts of the state.

Portions of mines long since abandoned have been reopened to mine coal, which under previous conditions had been considered unprofitable. Many small mines are being opened along the outcrop of the coal seams of old abandoned mines. Many of these operations will of necessity be of short duration, and will only operate while conditions render them a profitable investment, while others will be of a permanent nature, and will increase their coal territory and add very materially to the mineral resources of the state.

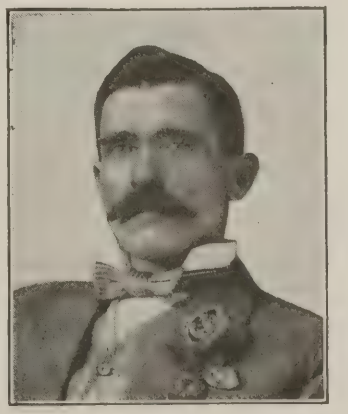
Rapid progress is being made in the tonnage reported from coal territories where the coal seams are adapted to the method of mining known as "stripping." These mines have been opened up in the counties of Harrison, Jefferson, Perry and Tuscarawas, and in the year 1916 reported a tonnage of 533,152 tons mined. The year 1917 will undoubtedly show a much larger production from this method of mining coal.

Several mine fires were reported to the department during the year, but were controlled without the loss of life and any great property damage. The most serious mine fire occurred at mine 268, operated by the Ohio Collieries Co., Toledo, Ohio, located in Perry County; the fire started from an unknown origin, and the mine was idle 60 days awaiting the sinking of an interior shaft, after which it resumed operation with an output of from 450 to 600 tons of coal per day. This mine fire was unusually difficult to control, owing to the fact that it was connected with other mines, some of which had been abandoned for years. The fire section remains sealed at the close of the year.

What gave promise of a very serious mine fire occurred at the Superior No. 12 mine operated by the Superior Collieries Co., located in Jackson County, Ohio. On Dec. 11 the tipple burned down at 4:30 o'clock in the afternoon, the flames communicating to the coal near the bottom of the shaft, caused by the timbers of the shaft becoming fired. Prompt work on the part of the department, assisted by employees of the coal company, arrested the spread of the fire, and it was extinguished without the necessity of sealing the shaft.

On Mar. 20, 1917, the State Legislature in session amended Secs. 929 and 950 of the R. S., regulating the lowering and hoisting of persons in mines by vertical shaft 50 ft. or more, and requiring additional emergency openings for egress from dangerous mines.

On Mar. 21, 1917, Secs. 973-976 and 914 of the G. C. were amended relative to the location of oil and gas wells, abandonment, inspection and the interpretation of "coal-bearing and coal-producing townships."



Sixteen prosecutions were reported during the year for violations of the mining laws. For going beyond a danger signal, for entering a mine in an intoxicated condition, 4; operating a mining machine unshielded, 2; for violation of the carbide law, 6; violation of the breakthrough law, 2; riding on moving trips, 1; for fireboss making a false report, 1. These fines amounted to $155.

Considering all circumstances entering into the different phases of coal mining during the year 1917, the outcome of the industry has not altogether been an unsatisfactory one in point of production. With the advent of governmental control of all railroad equipment, marked improvements can be anticipated the coming year of 1918.

Oklahoma

By Edward Boyle
Chief Mine Inspector, McAlester, Okla.

DURING the fiscal year ended July 1, 1917, there was produced from the mines of Oklahoma 3,861,697 tons of coal. This is an increase in production from the previous year of 808,154 tons. Of the 1917 output 2,508,123 tons was obtained by pick mining, while 1,353,574 tons was produced by machine mines. This is

Edward Boyle

an increase of machine-mined coal of 582,820 tons over the production for 1915, which is significant of the progress made in this state in recent years in this method of mining, when it is remembered that in 1910 the production of machine-mined coal was practically nothing.

Oregon

By Henry M. Parks
State Mine Inspector, Portland, Ore.

PRODUCTION of Oregon coal mines for 1917 has not changed materially over 1916. The total of all grades marketed in 1916 was 43,404 tons, which sold at an average price of about $3 at the mines, and it is not expected that the output during the past year will exceed that figure to any considerable degree. The productive mines of the state are limited almost entirely to Coos County, in the vicinity of Coos Bay, where five properties were active during 1917.

The Beaver Hill mine, owned by the Southern Pacific Railway Co., is the largest and best equipped mine in the district. It is located about 12 miles south of Marshfield and is managed by L. A. Wherat. The equipment consists of an up-to-date tipple and a screening and washing plant, which turns out about 150 tons daily of lump, nut and pea grades. At present this mine has about 50 men on its payroll.

The Henryville, or C. A. Smith, mine, owned by the Smith-Powers Logging Co. and leased by R. M. Jennings and associates of Portland, is located 6 miles southeast of Marshfield. The mine has good equipment and produces, normally, about 100 tons daily, 25 men being employed.

The Libby mine, located 3 miles southwest of Marshfield, is operated by the Coos Bay Fuel Co., with George Doll as manager. This mine has produced for 65 years and now employs about 20 men.

The Kay mine, located at Riverton, and formerly operated by the Riverton Fuel Co., has been taken over by J. R. McGee. It has been a steady producer; some 30 men are employed. The only casualty noted during the past year was at this mine and that in February, last, when a miner was killed by falling rock. Another mine is the Pansy Hill, owned by the Coos Bay Water Co. and leased by J. C. Swanson.

The coal mined in the Coos Bay district has been classed by the United States Geological Survey as a good grade of sub-bituminous. The average of 18 samples taken is as follows:

Air-Dried Sample:	Per Cent.
Moisture	9.6
Volatile matter	36.3
Ash	13.2
Fixed carbon	40.9
	100.00
Sulphur	2.05
Calories	5,399
British thermal units	9,720

The North Pacific States, and especially Oregon, are now experiencing general critical conditions in the fuel supply. California oil producers, who have formerly supplied this section with crude oil for heating and steaming purposes, are refusing to make further shipments to meet new demands and decline to renew contracts after present ones expire. Considering the fact that crude oil has been the great competitor of coal, the situation is such as to make conditions more favorable to coal mining. Likewise the scarcity of wood as fuel has favored the same condition. It seems almost incredible that with cities located in the heart of such magnificent forests as Oregon possesses that wood should be nearly prohibitive in price and scarce in quantity. The shortage of labor has made it impossible to get wood to market.

The Federal Bureau of Mines, in cooperation with the Oregon Bureau of Mines and Geology, is conducting experiments on fuel briquetting in an effort to utilize the fines produced by the screening plants in this district which are now being wasted.

The area of Coos County, which is underlain with coal, is about 300 square miles, with an average thickness of coal beds of 4 ft. It is estimated that the district contains over a billion tons of coal which, at the present rate of production, makes the supply almost inexhaustible. A closer study of market conditions and transportation, together with better methods of mining and management, might well be adopted to make this region a greater source of fuel supply. Conditions are generally improving and innovations being made to operate more cheaply and with greater capacity.

Pennsylvania

By Frank Hall
Chief Deputy, Department of Mines, Harrisburg, Penn.

THE output of the coal mines of Pennsylvania in 1917 is estimated at 267,735,001 net tons, of which 97,525,770 tons were anthracite and 170,209,231 tons bituminous. The production of coke reached a total of about 26,000,000.

The year is without parallel in the entire history of the coal-mining industry, not only on account of the unprecedented output of coal and coke, but also on account of the conditions more or less chaotic that prevailed, due to war demands and restrictions. These conditions were so abnormal and impelling in their character as to make it impossible for the operators to cope with them with entire success. New conditions are always difficult to deal with, and when they come as a result of an imperative demand from which there can be no exemption, they place a strain upon even the greatest resourcefulness and highest efficiency.

In spite, however, of the confusion that existed in all the mining centers and the drawbacks of car shortage and labor troubles, the coal and coke production exceeded by many millions of tons the output of any previous year.

In producing the great tonnage of the year the mines employed 335,323 men, and the number of fatalities among the workers was 1062. This may seem like a heavy toll of life, but comparatively, and with the unprecedented conditions considered, it is a good record. In 1915, with a production of 246,797,774 net tons, the fatalities numbered 1030, and in 1916, with a production of 256,804,012 net tons, they numbered 1001. In 1917, notwithstanding the tremendous activity that characterized mining operations and the almost universal disregard of the ordinary rules of safety by the mine workers, the percentage of fatalities shows only a slight increase over those of 1915 and 1916.

J. E. Roderick
Chief, Department of Mines, Harrisburg, Penn.

It must obviously be taken as a tribute to the superb equipment and efficiency of the hundreds of great mines in Pennsylvania and the skill of the workers that no catastrophe of magnitude occurred. When it is recognized that rapid work, long hours and a continual drive tend greatly to a lack of discipline and to increased danger, the small number of fatalities gives evidence of unusual preparedness and of most careful operation of the mines.

The year's activities were hampered somewhat by labor shortage, strikes, disturbances over wage scales and by an inadequate car supply.

ANTHRACITE

District	Production, Gross Tons	Employees	Fatal Accidents	Coal Consumed at Mines

24	3,062,696	5,163	18	309,459
25	2,730,000	5,200	16	570,000
Totals,	87,076,580	155,615	572	8,265,746

Strikes occasioned very little trouble, but in most districts the shortage of labor and cars was keenly felt, although in some instances the handicap of labor shortage was overcome by increasing the number of working hours.

A few districts for some unknown reason seemed to be entirely immune from all untoward conditions and passed through the year without loss of trade or inconvenience of operation. The output, had all conditions been favorable, would probably have reached 300,000,000 tons.

The coke output, great as it was, would have been several million tons greater had labor been more plentiful. During the summer months it was almost impossible to obtain coke drawers, and the conditions became so acute and the prospect seemed so hopeless that some of the companies changed their ovens from hand- to machine-drawn types. The hindrances to the trade, however, serious as they were at times, had the effect merely of reducing somewhat the unusually large profits of the operators.

One of the improvements in mining conditions is the gradual adoption of electricity as a means of power and for illuminating purposes. Several of the larger companies are replacing steam power with electric power, hoists are being placed on shafts and slopes with automatic brakes to check over-speed or over-hoists, and electric lights are being placed in the mines along the gangways and at all other places where lights are required. Gasoline motors are being replaced by electric haulage.

The beneficent effect of the recent child-labor legislation is being felt very appreciably in the mining communities, and the good results are not confined alone to the children, who are now in school acquiring an education instead of wearing their young lives out at the hard task of breaker work or in the mills and factories, but into the homes and to the parents have come new ideals and loftier aspirations, brought to them by the children who are daily being taught higher standards of life and the desirability of finer moral and mental equipment for the struggles of the future. It is reported from some sections that the lessons inculcated in the young minds regarding the evils attending the use of alcoholic beverages are being carried home and so impressively presented to the other members of the household that many fathers and brothers are being weaned away from the greatest enemy to health and domestic happiness.

There were very few innovations of note in connection with the mining operations or in the social conditions of the mining communities. Some of the anthracite operators have installed improved breaker machinery by which the number of persons employed in the preparation of coal has been greatly reduced. In the different mining communities many modern houses have been erected for the employees. Equipped with modern conveniences and the additional attraction of yards and gardens they are in every way most satisfactory dwelling places. The educational advantages and social conditions of the communal life of the mine workers and their families are gradually but assuredly improving.

The year has been one of great prosperity to both the operator and the miner. Prices for coal were exceedingly high until near the close of the year when the prices were fixed by the Federal Government, lessening to a great degree the vast profits that were being garnered by the operators. Even under the Government prices, however, the well-conducted mine is profitable and no fear need be entertained as to the results of the coming year. The wages of the miners have risen to almost unreasonable heights and reports of unheard-of earnings are received from all sections of the regions.

The war has called attention to the really modern science of coal mining, particularly in the United States. Pennsylvania, the great leader in coal production, had scarcely an organization as a coal community during the civil war, 1860 to 1865. In 1860 the output of anthracite was about 8,000,000 tons, less than one-tenth of the present production. The output of bituminous coal which was just beginning to make itself felt as a factor in industrial circles was 10,000,000 tons, or about one-seventeenth of the great production of the present time.

With the extraordinary demand for fuel and the stimulus of extremely high wages, the outlook in Pennsylvania is favorable for a record-breaking production in 1918 provided the car supply and car distribution can be maintained with necessary efficiency, and further provided that the men can be kept steadily at work instead of indulging in the too-frequent vacation periods for the purpose of enjoying their munificent earnings.

Texas

By B. S. Gentry
State Inspector of Mines, Rockdale, Tex.

IN TEXAS, during the year 1917, the total production of coal is estimated to have been about 2,650,000 tons, of which 1,400,000 tons was bituminous and 1,250,000 tons lignite. There were in operation during the year 16 bituminous and 30 lignite mines. No new bituminous mines were opened, but the close of the year sees a number of new lignite mines under construction.

Some of the mines have suffered from car shortage and there has been some labor shortage. The bituminous mines, which are located in the northern part of the state, employ principally American and Italian miners, while the workers in the lignite mines are principally Mexican miners. All the mines have been practically free from strikes during the year.

The high price of fuel oil is creating a large demand for lignite, and it looks as if the year 1918 will find most of the large steam plants using lignite. Fuel oil has always been a strong competitor of lignite, and with this competition largely removed there should be an enormous development throughout the lignite fields, which extend practically across the state, beginning in the northeast corner and extending in a southwesterly direction to the Rio Grande, or Mexican border. The seams along this formation are not workable at all points, in many places the seams are too thin, etc. At many points there are known to be three or more seams overlying one another and all of workable thickness. The average cover between seams is between 40 and 50 ft., while the seam nearest the surface has from 10 to 200 ft. of overburden. The largest deposits are probably located in Milam and Bastrop Counties. Other counties where lignite is mined are Titus, Hopkins, Wood, Henderson, Leon, Houston and Robertson.

Each year sees many improvements in the lignite fields, and the primitive methods of a few years ago are giving way to modern systems. Many well

equipped mines have been opened recently. Most of the lignite produced in Texas is pick-mined, and of the bituminous production about one-half is shot off the solid. There are no mining machines in use in the lignite mines, though a few machines are in use in some of the bituminous mines. The lignite mines should offer a good field for future use of mining machines, it being necessary only to find the type of machine adapted to these particular seams.

There were few fatal or serious accidents in Texas mines during the year, little hazard or risk being connected with the mining industry of the state, as there are no gaseous seams of coal and the roof conditions are usually good. The indications are that the output of both bituminous and lignite mines during 1918 will be the largest in the history of the industry in Texas.

Utah

By Robert Howard
State Mine Inspector, Salt Lake City, Utah

THE coal industry of the State of Utah, during the year 1917, has been peculiar in many ways. The year started out with the various coal companies having many more orders for coal than they could possibly fill. The demand was greater than at any other time in the history of the state.

Robert Howard

The mines were in shape to produce a large tonnage, but were handicapped by a shortage of railroad cars.

The slow work in our coal mines had caused many of the miners to leave the mines and go where work was more steady. This caused a shortage of men, which has continued all through the year until during the month of October, when men began to come back, and at the present time most of our coal mines have all the men they can use and some are refusing to hire more men.

The shortage of men was a good thing in that it gave those men who were working a chance to earn more wages, as the miners usually got all the cars they could on workdays, and on idle days they could go in the mine and put their working places in good shape, and probably load some empty cars left from the previous day. Daymen, both in the mine and on the outside, were given as much work on idle days as the companies could find for them, thus helping to hold this class of labor at the mines.

During several months of the year the railroad-car shortage was so bad that the mines worked but little more than half time.

Utah Coal Has Wide Market

Besides furnishing the coal for our own state, the market for Utah coal is found in the States of Idaho, Nevada, Washington, Montana and California—these states looking to the mines of Utah for a large part of their coal supply. In some districts, during the early part of the year, the shortage of coal was felt so keenly that fences, shade trees, etc., were cut down and used for fuel. During the entire year there has been no let-up in the demand for Utah coal. Delegates from the State Council of Defense of Idaho and from other states have visited the various coal companies to check up the coal production and see if it was not possible to get more coal shipped to their respective communities, all to be met with the same cry, that the railroads could not furnish the mines with cars, and the mines were only working about half time.

During the month of November, the Utah Coal Road (which has been under lease to, and had been operated by, the D. & R. G. Ry.) commenced to handle its own railroad and take care of the United States Fuel Company's mines at Hiawatha, Blackhawk, Mohrland and Panther, and, as this railroad is using its own cars and engines, it has taken this amount of work from the D. & R. G. Ry., which is now better able to take care of the balance of the coal mines which are located on its lines. At the present time the mines are working better and a much larger tonnage of coal is being produced than at any other time during the year.

There has been very little labor trouble at the mines during the year. At three mines demands were made for more wages; these demands were settled by giving the men an increase. Wages at the mines have been increased four times during the year, and at the present time wages are from 60 to 70 per cent. higher than they were on Jan. 1, 1916. It is not uncommon to find miners earning $12 to $15 per day, and making between $300 and $400 per month, in the various mines.

The coal mines of this state are chiefly in Carbon, Emery and Grand Counties, and are located on the Denver & Rio Grande Ry. On June 26 the dam of the Mammoth Reservoir, located several miles above Scofield, and built for the purpose of storing water to irrigate about 30,000 acres of land in Carbon County, Utah, broke, and the water rushed down Pleasant Valley, washing out 15 miles of the Scofield ranch of the D. & R. G. Ry. At Colton the water ran into Price River and washed out parts of the main line of the D. & R. G. Ry. between Colton and Helper, Utah, causing a loss of probably more than one million dollars to the D. & R. G. Ry. and cutting off the state's supply of coal.

This caused a delay of two months to the mines located at Scofield, Clear Creek, Utah Mine and Winter Quarters, and the balance of the mines located in the Helper District were delayed about a month as a result of this flood. The loss in the production of coal due to the D. & R. G. tracks being washed out by this flood of water is estimated at 400,000 tons of coal, but notwithstanding this, and the fact that the mines worked little more than half time during a large part of the year, we find that the tonnage has increased and our mines have produced 4,051,210 tons of coal, this being 429,275 tons, or 12 per cent., more than was produced during the year 1916. From the coal produced 668,058 tons was made into coke at the Sunnyside coke ovens.

An average of 3434 men was employed at the mines, and 325 men were employed at the coke ovens, this being approximately the same number as was employed during the year 1916.

There were 20 fatal accidents during the year, this being one fatal accident for each 203,060 tons of coal produced. During the year 159,700 lb. of black powder and 583,166 lb. of giant and permissible powder were used, or 1 lb. of powder for each 5.47 tons of coal mined. The average time worked at 14 of the largest mines was 207 days for the year.

Many "Snow Birds" in State

There are a large number of country banks and wagon mines in the state, some of these having an output of several thousand tons each. This coal is hauled to the railroad and loaded into railroad cars. The tonnage from these mines is estimated at 30,000 tons, but will exceed this figure.

In addition to the number of men actually employed in producing coal, there has been a large number of men at work making improvements, among these are 60 new houses and 84 coke ovens, which have been built at Sunnyside, 20 new brick houses built at Standardville and 25 houses built at Rains. The present mines have been developed for a much larger production, and the operators are looking forward to the year 1918 being a banner year.

There are several new mines being opened up, development and construction work having been going on for several months past. These are the Liberty Fuel Co., the Wattis Coal Co. and the Peerless Coal Co. If the railroads furnish cars, as it is hoped they will, the 1918 production of coal in the State of Utah should be 50 per cent. greater than that of this year.

State-wide prohibition went into effect on Aug. 1, and so far as the mines are concerned it is working out in good

shape. The miners are at work the day after payday, and the output of coal is kept up to normal instead of being reduced for several days after payday, as it was before prohibition went into effect.

Washington

By James Bagley
State Mine Inspector, Seattle, Wash.

PRODUCTION of coal in 1917 promises to be the largest in the history of the state, with the possible exception of 1910, when the production was 3,979,569 short tons. Owing to floods during the present month, the coal production will fall considerably during the current month. According to reports received and an estimate for December, the output will be about 3,965,000 short tons, an increase of over 945,000 tons, or about 32 per cent., as compared with 1916. Approximately 5400 men are employed at the mines at the present time as compared with 4746 in 1916.

The outlook for the industry in 1918 is bright. The demand for coal in the state is due principally to the shortage and high price of fuel oil, and consumers of oil are changing over to coal. There have been no new mines opened during the present year, but some of the old mines have been reopened. No labor troubles occurred during the present year. All the mines in the state are now organized.

Twenty-eight fatal accidents have occurred to Dec. 24 as compared with 21 in 1916. Of this number six bodies have not been recovered, and rescue operations are now proceeding to recover the bodies of six men caught by a cave-in of the pillar workings at the Wilkeson Mine, Wilkeson. This accident occurred on Dec. 17.

West Virginia

By Earl A. Henry
Chief, Department of Mines, Charleston, W. Va.

DURING the past year the coal industry of West Virginia has been in a very unsettled condition. The lack of railroad facilities and shortage in the supply of railroad cars have retarded the progress to such an extent that the production has remained practically at a standstill. A large number of new companies have been organized and quite a few consolidations have been made. The statistics contained herein are for the fiscal year 1917, which began July 1, 1916, and ended with June 30, 1917. During this period 665 companies operated within this state and reported 1186 operating mines, which produced 79,806,652 gross tons of coal as against 79,612,298 gross tons last year—this being an increase of 194,354 gross tons. Two counties, Webster and Wetzel, were added to the coal-producing counties, thus making 35 counties in the state in which coal is mined. Eleven counties within the state producing more than 1,000,000 tons each are as follows:

McDowell	18,671,942
Fayette	9,555,518
Logan	8,859,122
Raleigh	6,304,282
Kanawha	5,577,677
Marion	5,125,390
Harrison	4,675,411
Mercer	3,225,429
Mingo	3,207,162
Barbour	1,306,983
Taylor	1,270,182
Tucker	1,214,964
Marshall	1,119,827
Preston	1,106,378

From this it can be seen that McDowell still heads the list of producing counties in this state with a production of 18,671,942 gross tons, which is a decrease under the production of last year of 327,137 gross tons.

During the year 90 companies within the state produced more than 200,000 gross tons each and seven companies of this number produced more than a

Earl A. Henry

million gross tons. The United States Coal and Coke Co., of McDowell County, has taken first place among the coal-producing companies, it having mined 4,552,132 gross tons. The seven companies mining more than a million gross tons each are as follows:

United States Coal and Coke Co	4,552,132
Consolidation Coal Co	4,021,808
Pocahontas Fuel Co., Inc	2,443,160
Island Creek Coal Co	1,843,742
Davis Coal and Coke Co	1,658,335
New River and Pocahontas Consolidated Coal Co	1,649,876
Solvay Collieries Co	1,102,655

During the period covered by this report, 79 coke plants within the state manufactured 2,533,314 net tons of coke, which is an increase over the previous year of 575,682 net tons, or 29.41 per cent.

During the year there were employed at the mines and coke ovens within the state 88,665 persons, an increase over the previous year of 8607 persons. The total number employed were distributed as follows:

Pick miners	17,839
Machine miners	25,634
Machine runners and helpers	4,905
Inside laborers	21,987
Outside laborers	15,730
Coke workers	2,570

While this shows a large increase in the number employed, yet the number of days worked was reduced to 215, which is a decrease under the previous year of 17 days, and which accounts in a great measure for the small increase in production. These employees were classified as to nationality as follows:

American (white)	48,237
Negroes	18,128
Italians	7,388
Hungarians	4,346
Polish	2,117
Slavish	1,215
Austrian	1,833
Russian	1,362
Other nationalities	4,039
Total	88,665

The mines of the state during the past year worked but 215 days as against 232 days last year, which accounts in a great measure for the small increase in production. The equipment of the coal companies of the state is such as to warrant the production of at least 125,000,000 gross tons annually. I am convinced that this production would have been made had it not been for the lack of transportation facilities and shortage of railroad cars which continued throughout the entire year.

The average price received by pick miners during the year for run-of-mine coal was 69c., which is an increase over the previous year of 17c. per ton. The average tonnage produced by each pick miner was 1649 gross tons, a decrease of 50 tons under the year 1916. The average annual wage of pick miners (all pick miners included) was $1137.-81, an increase over last year of $254.33. This shows that while the miners worked fewer days and produced less coal, yet their wages were increased 28.80 per cent.

The average selling price of coal shipped from the mines in the state was $2.26 per gross ton, an increase of $1.17 over last year. At this price the value of coal produced amounted to $180,363,033.52, an increase over the previous year of $87,969,481.03. During this same period coke was sold f.o.b. at the ovens at an average price of $4.77 per net ton, an increase over the previous year of $2.76 per ton. The total value of coke produced was $12,-083,907.78, an increase over last year of $7,972,880.58, thus making a total increase in value of the production of the state of $95,942,361.61.

During the year there were 394 lives lost in connection with the mine operations. Of this number 348 were killed inside and 46 outside the mines, this showing a decrease in the number of fatal accidents of 22 inside and an increase of accidents occurring outside the mines of 17, making a net reduction in the number of fatalities of 5. During this time there were 993 nonfatal accidents at the mines, 826 of which were inside and 167 outside, which is a decrease under the previous year of 184.

Two explosions occurred within the state, one inside and one outside the mine. On Oct. 19, 1916, a gas explosion at Jamison No. 7 mine of the Jamison Coal Co., in Marion County, killed 10 persons; and on Apr. 18, 1917, five men were killed at Linden mine of the Hutchinson Coal Co., in Mason County, when lightning struck the powder mag-

azine from which they were getting their daily supply of powder.

For each life lost within the mine during the year there was 229,329 gross tons of coal mined, which is an increase over the previous year of 14,650 gross tons for each fatality. The 348 lives lost inside the mines occurred at 262 mines, employing 29,530 persons inside, which produced 36,299,057 gross tons of coal; while the remaining 924 mines worked the entire year without the loss of a single life and produced 43,507,595 gross tons. The causes of fatal accidents are summarized as follows:

Killed by explosions (all forms)	12
Killed by fall of roof and coal	218
Killed by mine cars	51
Killed by electrocutions	20
Killed by other causes	47
Total	348

The ratio of persons killed per 1000 men employed inside the mines during the year was 4.95.

The past year has witnessed considerable improvement in the general condition of the mines of the state. Statistics are not kept of these improvements and it is therefore impossible to give them by item. The coal companies have not only added greatly to their equipment and sidetrack facilities, but have spent millions of dollars during the year for the betterment of the sanitary and safety conditions of the mines, which I am safe in saying places the mines of West Virginia second to none in this country.

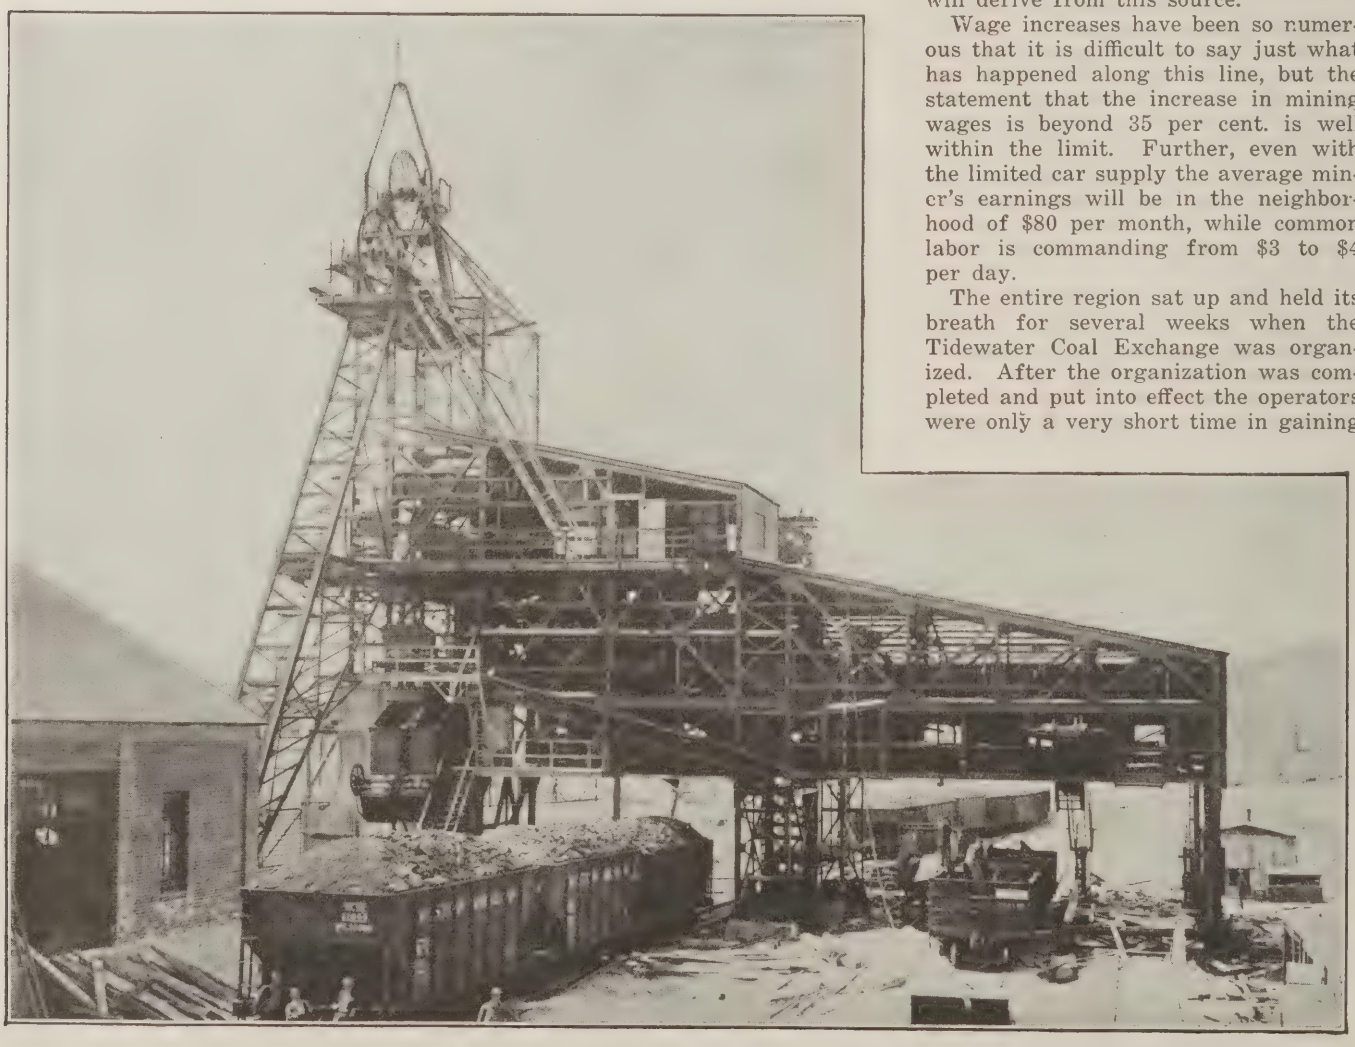
In conclusion I desire to say that this department throughout the entire year has received the hearty coöperation of all the coal companies, miners and mine laborers, which has been the chief factor in placing this state in the position it now occupies among the coal industries of the country.

Northern West Virginia

By H. A. Williamson

Fairmont, W. Va.

WRITING a résumé for northern West Virginia for 1917 is like digging a jigger out of your leg—the harder you dig the deeper he goes.



It is unnecessary to enlarge on the car shortage—everyone knows about it. Had there been even a fair car supply the labor shortage would have been serious, but under the circumstances few or no steps have been taken, or needed to be taken, to get the men to work. From present indications it looks as if this condition would continue indefinitely. Should the railroads or Federal Government find means to supply cars, there is no doubt but that the region could and would double its present production, and as the coal is so badly needed it appears to be squarely up to someone to furnish cars. Should these cars be furnished there would immediately exist a shortage of labor, but this could be overcome and in any event does not look imminent at this time.

In regard to Federal price regulation much has been written but little said. It is possible that some small wagon-loading mines or mines working at particular disadvantage may have been forced out, or some disgruntled operator may have curtailed his output. On the whole the output of the region is just as great as the car supply will allow it to be, and the operators are getting out all the coal they can ship. It might be mentioned in passing that there are in the region about 50 mines now loading coal exclusively by use of horse teams or auto trucks.

On the part of labor, the wage regulation so far appears satisfactory. What would happen if there were plenty of work and the Government regulation to fine men $1 for each day they did not work was carried out, is a question, but it is probable that men who did not work their best would get little sympathy; with present scarcity of work, however, it will probably be a small income the American Red Cross will derive from this source.

Wage increases have been so numerous that it is difficult to say just what has happened along this line, but the statement that the increase in mining wages is beyond 35 per cent. is well within the limit. Further, even with the limited car supply the average miner's earnings will be in the neighborhood of $80 per month, while common labor is commanding from $3 to $4 per day.

The entire region sat up and held its breath for several weeks when the Tidewater Coal Exchange was organized. After the organization was completed and put into effect the operators were only a very short time in gaining

TYPE OF MODERN TIPPLE BEING ERECTED IN NORTHERN WEST VIRGINIA

FLOOR OF ONE OF THE DEPARTMENT STORES IN NORTHERN WEST VIRGINIA

confidence, and at present practically everyone seems to be at least sufficiently satisfied as to consider serious objection to any of the commissioner's rulings unnecessary. There are still, however, many details for the Exchange to work out, but this appears to be progressing smoothly and, all in all, one might say that up to the present time the Exchange is a success.

Government control of railroads and mines has been discussed, but in reality has never been seriously considered; and before such an event can actually take place there will have to be many developments not now anticipated. Much more to the point would be some method by which the Government could stimulate river coal traffic. This has been discussed in the past, and to the sorrow of certain parties, attempted. At present no effort is being made to load river coal, and no serious plans of such nature appear under way. Undoubtedly quite an appreciable quantity of coal could be moved in this manner, but every attempt of this nature has failed in the past and there is no wild rush of operators to lose more money on such a venture. It would, therefore, appear to be up to the Federal Government to figure out some plan if such coal would help the situation any.

The Fairmont Lake trade probably suffered as severely as any line of outgoing coal, but here again it has been due to lack of cars. Certain special offers were made if the mines would work continuously on Lake coal for specific periods and then either no effort, or at least no successful effort, was made to furnish such mines with cars. So that after a very short time the matter drifted back to where it had been before the special offer was made. If there is a shortage of coal in the Northwest during this winter it is not to be blamed on the operators, because it is absolutely true that the operators made desperate and continued efforts to get coal to the Lakes.

The coke trade has been revived by the enormous demand for this character of fuel. Every coke oven in the region that was at all possible of repair has been put into operation. The coke tonnage of 1916 increased by half over 1915, and 1917 will probably double 1916. This, of course, is largely due to the high price coke is commanding. Should coke prices be regulated to anything like normal it is probable this production would almost entirely disappear as the region does not appear to be interested in the manufacture of coke except under abnormal conditions.

More or less activity has continued in coal lands and there has continued the strong tendency for this to extend beyond the Pittsburgh seam and take in the Sewickley coal. This Sewickley, lying above the Pittsburgh and running from 5 ft. thick down to nothing, has, in the past, been considered either as worthless or at best a dangerous venture in which to place money. Now, however, purchases of Sewickley coal have been made and several companies are producing this coal. Under present conditions there is ready sale for all the Sewickley that can be mined, but it is a question in the minds of many as to what will happen to these mines in the future, both on account of the general quality of this coal, the erratic natural conditions of the seam and also the possible damage it has suffered, and will continue to suffer through removal of the Pittsburgh seam below it.

Probably the largest single sale of Pittsburgh coal was the transfer of some 11,000 acres in what has been known in past years as "The Empire Field"—this field is largely tributary to the Monongahela Railway.

The Monongahela Ry. has now been opened for over a year, and there are 16 mines operating on it between Fairmont and the Pennsylvania state line. These are mostly in the Pittsburgh seam, although some Sewickley and some Red Stone coal are being produced. There are also some eight or ten "wagon loaders," or "snow bird" mines, operating on this line at and near Fairmont.

On the two branches of the Western Maryland Ry., built during the past two years and connecting with the Baltimore & Ohio R.R., there have been opened some 17 mines, some of these being the finest mines of the region, notably Mines Nos. 86 and 87 of the Consolidation Coal Co. at Ida May and Carolina, and the same company's mines Nos. 88, 89 and 90 at Wyatt.

The continued work along the "safety-first" idea is showing results, and the region is getting into better condition steadily. Unfortunately, however, one accident occurred during the year to which special attention should be called. Two men, supposedly thoroughly trained and of sufficient experience, were killed within one of the mines while wearing an approved type of rescue, or oxygen, helmet. It is said that these men remained underground beyond the time limit of the apparatus. Aside from the deplorable loss of life, this accident serves a good purpose in calling attention and pointing out that entirely too much confidence is placed in this class of equipment and that far more care should be exercised in using

such equipment, no matter how efficient it may be.

The exhaustion of the natural gas of the region is causing some concern, and talk of a byproduct plant still continues. Along this line the Monongahela Valley Traction Co. is erecting a Lymn producer-gas plant, or what is possibly better known as a byproduct-producer plant. The initial plant will consist of seven units, consuming about 75 tons of coal per day and producing the equivalent of 1,500,000 ft. of natural gas in addition to the byproducts. This plant is the second of the kind to be erected in the United States, and if it proves successful will probably lead to large developments along this line. The electrification of the mines of the region continues, and the same company (Monongahela Valley Traction Co.) is adding another unit to its power plant at Hutchinson. This plant being gas driven, it would appear that eventually it will have to be supplied with artificial gas. The Monongahela Valley Traction Co. also has under construction a steam turbine-driven power plant which will produce 100,000 kw. when complete. The building for this plant, 170 x 200-ft., is located at Rivesville, W. Va., and is well under way.

In lines closely connected with the coal trade are noted the Monongahela Powder Co., a new concern located near Fairmont, manufacturing explosives for use in the mines; also the Fairmont Chemical Co., located east of Fairmont, producing sulphuric acid from sulphur balls, or coal brasses. These brasses, formerly a waste product and object of more or less expense at the mines, are now sold to the acid plant. The acid in turn is largely used in byproduct plants and will be available for such a plant should one be erected in the neighborhood.

To undertake to make a statement as to what will happen in 1918 in northern West Virginia coal circles is beyond the power of human mind. Should a way be found to furnish adequate car supply and to move the cars to destination after they are loaded, it appears that the region will be able to supply the demand for its coal. There will, of course, remain the serious question of labor shortage, but this is not nearly so bad as the car shortage and can probably be largely overcome.

By and large, while there is a certain amount of pessimistic talk, there appears to be an undercurrent of confidence that business will continue good in coal lines. It is also to be noted that every man and boy, from the youngest trapper to the most successful operator, is boosting the coal business and striving to make it go. Here there are no unpatriotic speeches or publications, no attempts to keep men from working, no efforts to destroy property or to hamper the Government. It is plain that the entire region is straining at the harness in one mighty effort to do its "derndest" to help win the war.

Wyoming

District No. 1

By George Blacker

State Mine Inspector, Cumberland, Wyo.

THE year 1917 is the banner year in my district, and with the increased tonnage goes the matter of improvements so vital and necessary to the successful management of the coal industry. The demand for coal, especially of the kind produced in this district, has been unprecedented, taxing the capacity of the mines to their utmost and not being able to supply it, with the result that other concerns seeing the unlimited opportunities of these coal fields are investing their capital in the development of new mines in order to meet the present and future requirements of the trade. Therefore new mines are opening on well established coal seams; old prospects are being cleaned out with a view to their development, and the activity all along the line must result in a production of many hundred thousand tons more than our present record shows.

The high cost of living and the mutterings of dissatisfaction incident thereto happily found a solution when the representatives of the United Mine Workers of America and the managers of the different companies met for the purpose of adjusting the wages in this district. The result of the convention was a general and generous increase from the top to the bottom, and I venture to say that the present scale of wages is as great as, if not greater than, that in any district in the Union. The settlement of the wage question has brought about an era of good will and contentment and a further desire on the part of the miners to do their ut-

George Blacker

most toward the production of coal, and in this manner satisfy the demand made upon their energies, with the certain knowledge that in doing so their pay check will read bigger and will be ample to cover all their wants.

Shortage of labor has compelled, in some instances, in order to keep up the output, withdrawing of pillars, which had better be left in under ordinary conditions. To try and reach a higher point of economy and efficiency, the Kemmerer Coal Co. has this year installed a battery of Stirling boilers to replace its old plant, with all modern improvements known to the manufacturers of these boilers for economy and efficiency. Locomotive haulage is being installed in No. 6 Mine, sublet.

PLANT OF THE BIG HORN COLLIERIES CO., CROSBY, WYOMING

By use of a counterbalance at No. 5 main hoist, sublet, the monthly consumption of power has been reduced from approximately 30,000 to 9800 kilowatt-hours.

The tonnage by counties in District No. 1 during the past year, the figures for which were furnished by various operators, is as follows: Lincoln County, 2,651,093; Uinta County, 70,269; Carbon County, 844,331; Sweetwater County, 3,082,055. The number of men killed in 1917 totaled 36; the number of men injured, 194; the number of wives made widows, 14; the number of children made fatherless, 32.

The causes of fatal accidents in the coal mines of this state for the year were attributed as follows: Falls of rock, 14; falls of coal, 11; mine cars and haulage motors, 5; railroad cars, 1; blast, 2; electrocuted, 1; miscellaneous, 2.

The number of men employed in each county is as follows: Lincoln, 1905; Sweetwater, 2576; Carbon, 630; Uinta, 65.

SUMMARY OF COAL PRODUCTION IN DISTRICT NO. 1, WYOMING

Year	Tons	Men Employed	Number of Fatal Accidents	Total Coal for Each Life Lost	Number Employees for Each Life Lost	Number Killed per 1,000 Employed
1911	4,865,761	5,446	22	221,170	248	4.1
1912	5,500,253	5,673	35	157,150	162	6.1
1913	5,229,817	5,670	21	249,038	270	3.7
1914	5,137,843	6,069	43	123,670	141	7.7
1915	4,460,169	5,363	18	247,787	298	3.3
1916	5,526,832	4,838	22	251,220	222	4.5
1917	6,047,748	5,176	36	167,993	144	7.0

SUMMARY OF THE ITEMS SHOWN IN THE REPORT, DISTRICT NO. 1, WYOMING

Number of counties producing coal	4
Number of shipping mines	36
Number of coal miners	2,231
Number of loaders	841
Total number of employees	5,176
Average days of active operation all mines	244
Number tons of coal undercut	3,527,053
Number tons of coal blasted from the solid	2,520,695
Total tons of coal produced	6,047,748
Number of fatal accidents	36
Number of nonfatal accidents	194
Tons of coal produced to each fatal accident	167,993
Number of employees to each fatal accident	144
Ratio of fatal accidents per 1,000 employees	7

Wyoming

District No. 2

By George N. Akin
State Mine Inspector, Sheridan, Wyo.

A CONSERVATIVE estimate of the total coal production in the district for the calendar year 1917, based upon the annual report of Sept. 30, 1917, would be about 2,800,000 tons, exclusive of a large number of small mines, employing less than 10 men, which make no report to the inspector.

This was distributed on the basis of about 43 per cent. to the railroads, 49 per cent. to commercial channels, the remainder being slack shipped or coal consumed locally.

The year has been a prosperous one for the industry in every way, the figures showing an increased tonnage, higher rates of compensation to employees and increased market values. The shortage in railroad cars has greatly reduced the net output. The mines were operated on an average of 18 days per month for the year, with a production of 1247 tons per man employed per year.

Many improvements have been made, and are under construction, at the various mines that will give greater safety to employees and more economical production for the mines. Present indications point to a prosperous period of activity in the industry for the district, and new mines are under development and others are in prospect of development. The success of the industry will depend largely upon the ability of the railroads to furnish enough cars for the output.

The total number of men employed during the fiscal year was 2197, being an increase of 138 over the previous year. The men shared in the general prosperity, there being an increase of 26 per cent. in the number of days worked, and of 19 per cent. in the number of tons produced per man employed.

There were seven fatal accidents during the year, making one man killed for every 391,608 tons produced and 3.18 killed for each 1000 employed. There were 51 nonfatal accidents reported for the year. Of these 44 per cent. were due to fall of rock or coal and 27 per cent. to moving cars. There was one man injured for each 49,850 tons produced, and 25.13 injured for each 1000 employed.

Alberta, Canada

By John T. Stirling
Chief Inspector of Mines, Alberta, Can.

IN THE province of Alberta, Can., the quantities and values of the various coals entered at the ports of entry, for consumption for the first three quarters of 1917, are as shown in Table I.

John T. Stirling

TABLE I—PRODUCTION FOR THREE QUARTERS OF 1917

Quarter	Lignite, Tons	Bituminous, Tons	Anthracite, Tons
First, ending Mar. 31, 1917	744,700	649,318	37,817
Second ending, June 30, 1917	227,879	177,579	11,387
Third, ending September 30, 1917	619,467	670,935	33,643
Totals	1,592,046	1,497,832	82,847

The figures which are given in Table I make a total of 3,172,725 tons of coal from all fields for the first three quarters of 1917.

The following table shows the number of tons of anthracite and bituminous coals sold and their value for the first three quarters of 1917:

Quarter	Tons	Value
First	571,739	$884,574
Second	525,807	1,569,224
Third	1,115,955	3,987,979
Totals	2,213,501	$6,441,777

British Columbia

By George Wilkinson
Chief Inspector of Mines, Victoria, B. C.

DURING the year 1917 there was mined in the Province of British Columbia 2,408,027 long tons of coal, a decrease of 77,553 tons in comparison with 1916. Of this amount 1,696,235 tons was mined by the collieries of Vancouver Island, 151,817 tons by the collieries of the Nicola Princeton district and 557,975 tons by the collieries of the Crow's Nest Pass district. The following are the comparative tonnages for the various companies and districts for 1917-16:

COAST DISTRICT VANCOUVER ISLAND

	1917	1916	
Canadian Collieries (D), Ltd	800,348	705,966	94,382*a*
Western Fuel Co	658,001	554,610	103,391*a*
Pacific Coast Coal Mines, Ltd	150,517	153,112	2,595*b*
British Columbia Coal Mining Co	61,547	78,443	16,896*b*
Nanoose Collieries, Ltd	27,822	630	27,192*a*
Totals	1,698,235	1,492,761	205,474*a*

(*a*) Increase. (*b*) Decrease.

The production of the Vancouver Island collieries for 1917 was increased 205,474 tons over the output of 1916.

COAST DISTRICT, SUB-DISTRICT OF NICOLA PRINCETON

	1917	1916
Middlesboro Collieries, Ltd	83,459	49,005
Merritt Collieries, Ltd	14,000	338
Inland Coal and Coke Co., Ltd	7,349	31,295
Pacific Coast Colliery		453
Princeton Coal and Land Co	46,919	29,458
	151,727	110,549

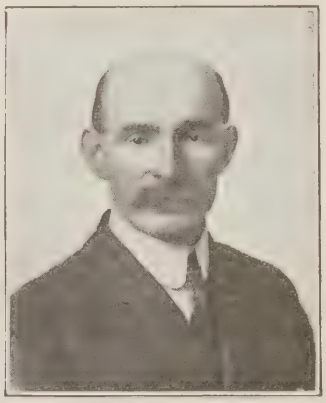
An increase of 41,268 tons.

CROW'S NEST PASS DISTRICT

	1917	1916
Crow's Nest Pass Coal Co	451,652	813,250
Corbin Coal and Coke Co	106,323	69,020
	557,975	882,270

A decrease of 324,295 tons below 1916.

Of the total amount of coal mined, approximately 291,755 tons was converted into coke. The total coke production for British Columbia was approximately 175,053 long tons. Of this amount the Crow's Nest Pass collieries made 144,654 tons. The Canadian Collieries (D), Ltd., made 30,399 tons at its ovens at Union Bay, Comox.



The prospects of a large production of coal in British Columbia were bright at the beginning of the year, and the

maximum tonnage for any month of the year was reached in March, when 244,145 tons was mined. In April a strike was declared at the Michel colliery, and on Apr. 5 a disastrous explosion occurred in No. 3 mine at Coal Creek colliery whereby 34 lives were lost. The men of the Coal Creek colliery were thereby thrown idle, and when operations were ordered to be resumed in the unaffected mines of the Coal Creek Colliery the men refused to report for work and joined the other parts of the Crow's Nest Pass district in a general strike. This strike was not settled until July and was responsible for a large reduction in the output of the Crow's Nest Pass collieries. No. 3 mine, Coal Creek, was unproductive for the balance of the year through the damage caused by the explosion.

Coupled with the explosion and strike as a factor in reducing the output is the shortage of labor, which has existed all the year. This has resulted in the closing down of some of the mines and the working of only single shifts in many of the others. The loss of output through various causes was very large.

Accidents for the Year

The number of fatal accidents for the year is great, due to two explosions, 34 being killed in one accident in the No. 3 mine of the Crow's Nest Pass collieries on Apr. 5. Six bodies yet remain in that section of the mine to which indications point as being the point of origin of the explosion. It will take several months to penetrate into this district as the roadways are badly caved and completely blocked. Wolf safety lamps were used exclusively in this mine and no blast was allowed, so that origin of the explosion remains a mystery.

George Wilkinson

Another explosion occurred in the No. 6 mine of the Canadian Collieries (D), Ltd., Cumberland, B. C., whereby four lives were lost. This mine was a naked-light mine, explosive gas rarely being found. Three surveyors went out on Sunday morning, June 3, to make a survey of the mine, a fireboss being detailed to accompany them and examine any of the places they wished to enter. In going into one of the places, one of the surveyors followed too closely on the heels of the fireboss and ignited a small accumulation of firedamp, which in turn started the dust, the place having been freshly cut the night before by a Sullivan chain cutter. None of the men was burned sufficiently to cause death, but all four died from carbon monoxide poisoning.

The other fatal accidents for the year are as follows: By falls of roof and rock, 3; by mine car and haulage, 2; by electricity, 1, making a total of six by other causes than explosion and a total of 44 in all.

The Canadian Collieries (D), Ltd., is opening a new mine at South Wellington which will be known as No. 5 mine. This mine is being opened in the Douglas seam and should be a large producer during 1918.

In the same district the Granby Consolidated Mining, Smelting and Power Co. has acquired a large area and is proving by diamond drilling. The Douglas seam has been proved in this area, and a large mine will be opened. This mine should also be a large producer during 1918.

The coal produced in this mine is to be coked for use in the company's own smelter at Anyox, where the company is erecting a large battery of byproduct coke ovens at an estimated cost of a million and a half dollars.

During the year the Western Fuel Co. reopened the Harewood mine. This mine is producing an average of 600 tons daily. Several other properties are being looked over by prospective purchasers and the outlook is good for Vancouver Island during 1918.

No. 1 Shaft and Pithead, Reserve Mine, Western Fuel Co., Nanaimo, B. C.

The Nanoose mine increased its output from 630 tons in 1916 to 27,822 in 1917, and should considerably increase its production the coming year. In the Nicola Princeton district the Tulameen mine and the Coalmont mine are both being reopened.

Many improvements were started in the mines of British Columbia in 1917. Some 2000 new Edison electric cap lamps were installed. The Burrell gas detector was introduced into the Crow's Nest pass mines for testing for small percentages of methane. A series of tests were made with the detector and samples for analysis taken at the same time, the detector checking very closely with these analyses. In no case was there a difference of more than three-tenths of 1 per cent., and in most cases there was no difference whatever. A good deal of work was done toward the treatment of coal dust. Rock-dust barriers were erected at the entrances of the districts of many of the mines, many of the roadways were treated by second burned ashes and sprinkling systems were installed.

Concrete Headworks, Morden Mine, Pacific Coast Coal Mines, Vancouver Island, B. C.

New Zealand

By Peter A. Yast

Melbourne, Australia

THE full report of the New Zealand state coal mines for the year ended Mar. 31 last is as follows: Two properties are being worked—namely, Point Elizabeth and Liverpool. The Point Elizabeth is now almost exhausted, and prospecting work is being carried on in other localities with a view to opening up a new mine. The probabilities are that an area at Charming Creek, Leddonville, will be selected. A seam of coal over 20 ft. in thickness has been proved and samples show the following average analysis: Fixed carbon, 55.14; volatile hydrocarbons, 41.89; water,

1.61; ash, 1.36. The sulphur content averages 5.04, but this is not greatly in excess of other coals on the market.

The gross output of the mines for the year ended Mar. 31 was 265,782 tons, as compared with 249,839 tons for the previous year. Of this total Point Elizabeth contributed 132,769 tons and Liverpool 133,013. The net tonnage was 252,810 tons. The total sales for the year amounted to 256,558 tons, value $1,209,251. The average price per ton was $4.71½, an increase of 64½c. The bulk of the coal is disposed of to the Government railways and for retail distribution through Government depots.

The net profit for the year, after making full provision for interest, depreciation, war bonus and all annual charges, amounted to $90,012. The bulk of this profit was earned by the Point Elizabeth colliery, and the official report states this "is partly due to the decreased amount charged as depreciation as compared with former years, and to the cessation on development work in view of the approaching exhaustion of the mine."

The property stands at the nominal book value of $7222, so that it was unnecessary to allow for further depreciation; but it hardly seems right under the circumstances that the expenditure so saved should be classed as profit for the year. In regard to the Liverpool property the profit was only $1239.30 as against a loss for the preceding year of $44,138. In this connection the report states: "While the figures indicate a good recovery, the result is disappointing in view of the tonnage produced and the large capital expenditure ($843,150) on which interest has to be earned. In order to place this colliery on a sound footing it is imperative that the present f.o.b. rates for coal should be increased to such an extent as to provide a reasonable net profit on the undertaking and to permit a sufficient sum to be set aside annually as a sinking fund for the redemption of the debenture and loan capital. It must not be overlooked that Point Elizabeth colliery is rapidly approaching the exhaustion stage, and when it ceases operations the whole of the interest charge, at present apportioned between the two mines, will have to be borne by Liverpool."

Nova Scotia

By D. A. Anderson
Halifax, N. S.

THE coal trade of this province continues to be hampered by the scarcity of men and shipping, as evidenced by the great falling off in coal shipments to the St. Lawrence River and the United States. The production for the fiscal year ended Sept. 30 is about 5,804,000 long tons, about 693,000 tons less than in the last previous year.

The price of soft coal has advanced to $7.75 a ton in Halifax, and a shortage for consumers is at present imminent.

A number of coal seams were opened during the year, notably in Cumberland County, where the Fenwick Coal Co. opened the Blight mine on the Chignecto seam, and the Sterling Coal Co., a mine on areas held by Sherwood & Swanson. The Strathcona Coal Co. and the Fundy Coal Co. (successors to the Atlantic Grindstone and Coal Co.) and the Eastern Coal Co., which have been idle for a few years, are again operating.

In Pictou County the Greenwood Coal Co. appears in the list of producers for the first time. In Inverness County much prospecting has been done about St. Rose and Chimney Corner. The latter mine, which has been idle since 1873, will produce coal this coming year.

An explosion on July 25 in No. 12 mine of the Dominion Coal Co., at New Waterford, by which 65 men were killed and one side of the mine damaged, and the destruction of the Bankhead by fire at No. 1 mine belonging to the same company, tended to decrease materially the production of coal in 1917. Pictou County increased its output over the previous year by about 73,000 tons.

Obituary in 1917

E. L. Shepley, of St. Paul, Minn., vice-president, Northwestern Fuel Co.

Jones G. Moore, of Birmingham, Ala., general superintendent of coal mines, Sloss-Sheffield Steel and Iron Company.

J. L. Wentz, of Philadelphia, former active member of J. S. Wentz & Company.

Benjamin Braznell, of Pittsburgh, Penn., coal operator.

William S. Hughes, of Scranton, Penn., safety-lamp inventor and manufacturer.

Charles M. Dodson, president, Weston Dodson & Co., producers of anthracite and bituminous coal.

George W. Schuederberg, of Pittsburgh, Penn., general manager Pittsburgh Coal Company.

Thomas D. Jones, of Hazelton, Penn., independent anthracite operator.

Joseph Milton Christy, of Moline, Ill., inventor of the box-car loader.

James Pease, of Chicago, president of the Chicago & Carterville Coal Company.

James F. Beavers, of Matewan, W. Va., vice president and general manager, Matewan Coal and Coke Company.

W. H. Wain, of Calgary, Alta., mining engineer and former manager, Georgetown Collieries.

Thomas M. Wilden, of Lansford, Penn., general inside superintendent, Lehigh Coal and Navigation Company.

Dennis H. Sullivan, of Coshocton, Ohio, former president, United Mine Workers in Ohio, former commissioner state board of arbitration and deputy mine inspector.

Andrew C. Bryden, of St. Louis, one-time operator of Murphysboro and Harrison mines, which are now the property of the Big Muddy Coal and Iron Company.

Alexander Bryden, of Scranton, Penn., consulting engineer, Pennsylvania Coal Co., the Hillside Coal Co., and New York, Susquehanna & Western Coal Company.

Thomas Russell, of Michel, B. C., mine manager, Crow's Nest Pass Coal Company.

E. Franz Roeber, of New York, editor *Metallurgical and Chemical Engineering.*

John McBride, of Columbus, Ohio, one-time president, United Mine Workers of America and one-time president of the American Federation of Labor.

Alex. Richards, of Esserville, Va., coal operator.

William Donald, superintendent, Stockton collieries, of Lehigh Valley Coal Company.

D. C. Roberts, of Marion, Ky., mine operator.

Marshall Sangrelet, of Belleville, Ill., superintendent of St. Louis & O'Fallon Coal Company.

Joseph V. Birtley, of Scranton, Penn., formerly superintendent of Pancoast mine of Price-Pancoast Coal Company.

Frederick F. Saward, of New York, editor of *Coal Trade Journal.*

P. J. Rogers, of Ensley, Ala., president, board of convict inspectors and formerly superintendent, Pratt City division of Tennessee Coal, Iron and Railroad Company.

J. Blair Kennerly, of Johnstown, Penn., mine operator.

Joseph B. Woodward, of Birmingham, Ala., president, Woodward Iron Company.

Williams H. Davies, of Hazelton, Penn., superintendent in Lehigh region of Lehigh Valley Coal Company.

Paul B. Cosgrove, of Johnson City, Ill., partner of firm, Cosgrove & Company.

James A. Phillips, of Cleveland, Ohio, one-time manager, Windsor Coal Co. and Steiner Coal Company.

John Thomas Morgan, of Birmingham, Ala., president, East Pratt Coal Company.

Lafayette Lenz, of Mauch Chunk, Penn., coal operator and railroad builder.

Anthracite Industry in 1917

By EDWARD W. PARKER
Director, Anthracite Bureau of Information, Philadelphia, Penn.

AS IN many other lines of industrial activity, the year 1917 in the anthracite industry was of such an abnormal character and was affected by so many conflicting conditions that a comprehensive discussion of it in the space permitted in an annual review and statistical number of even so elastic a medium as *Coal Age* is scarcely possible. It is necessary, therefore, to limit this review to the more important features to touch, as it were, the high spots only, and leave the preparation of a more detailed history until later.

It is common knowledge that the production of anthracite in 1917 exceeded any previous record in the history of the industry, for the monthly reports of shipments issued by the Anthracite Bureau of Information have kept the public informed on this subject and never before, probably, has there been so much interest taken by the public in the "statistical situation" of coal, both anthracite and bituminous. There were six months in 1917 when the shipments exceeded those of any month in previous history, and in three of these months the shipments amounted to over 7,000,000 tons, a record hardly deemed possible until it was accomplished. At the end of November the shipments of anthracite had exceeded by nearly a million and a half tons the record made in the twelve months of 1911, the year of previous high water mark in anthracite shipments. The total shipments for the year amounted to 77,133,305 tons, as compared with 67,376,364 tons in 1916, and with 69,954,299 tons in 1911. The increase in 1917 was accordingly 9,756,941 tons, or 14.5 per cent., over 1916, and 7,179,006, or 10 per cent., over 1911. Estimating the colliery consumption at 9,200,000 tons, the local sales at 2,000,000 tons, and the Sullivan County semi-anthracite production at 600,000 tons, it is found that the total output amounted to approximately 89,000,000 tons, an increase of more than 10,700,000 tons over 1916 when, as reported by the United States Geological Survey, the production was 78,195,083 tons. The production in 1917 was within less than 1.2 per cent. of the maximum (90,000,000 tons) output, estimated as obtainable in any one year from the anthracite mines. The shipments by months as reported to the Anthracite Bureau of Information is shown in the following table:

Month	Tons	Month	Tons
January	5,940,725	July	6,724,252
February	5,178,432	August	7,013,996
March	6,989,075	September	6,372,756
April	5,592,299	October	7,110,950
May	6,917,525	November	6,545,313
June	7,049,037	December	5,698,945

The total shipments for the last ten years have been as follows:

Year	Tons	Year	Tons
1908	64,665,014	1913	69,069,628
1909	61,696,885	1914	68,342,601
1910	64,905,786	1915	67,883,776
1911	69,954,299	1916	67,376,364
1912	63,610,578	1917	77,133,305

The record production of anthracite in 1917 was made in spite of a dwindling labor supply which, other conditions being equal, would have resulted in a decreased instead of an increased output. High wages and favorable conditions of employment offered by munition and other manufacturing establishments and by the Government in the construction of cantonments, shipyards, etc., caused many, particularly of the younger men, to desert the mines, and this migration combined with the voluntary and compulsory enlistments in the army and navy reduced the labor force in the anthracite region. At the close of the year the number of employees in the anthracite mines was absolutely at the irreducible minimum if the rate of production secured in 1917 is to be maintained.

There is, of course, some graduation from the mines every year, but heretofore this has been offset by new recruits drawn from the surplus labor market in Europe. In 1917 there was no inflow of foreign labor, and all the labor movement at the mines was outward. To have obtained the tonnage won in 1917 with the seriously depleted labor supply is almost to have achieved the unachievable, and the coal-consuming public owes a debt of gratitude to the operators and to the loyal anthracite mine-workers who have bent every effort during the trying months of 1917 to meet the needs of the country in fuel supply. The results were accomplished, and could only have been accomplished, by keeping the mines and breakers at work every possible working day, the mine workers denying themselves many customary holidays, and by having a practically adequate supply of railroad cars which prevented any serious broken time on that account.

"Community of Interests" Favors Anthracite

The "community of interests" between the anthracite carriers and the mining operators gave that branch of the coal-mining industry, so far as transportation is concerned, a decided advantage over the bituminous operators, many of which it was stated by officials of the mining companies, had not been able to work more than two or three days a week because of lack of cars, when the demand was such that, provided with ample car supply, they could have worked six days a week. In the anthracite region "the stone (that community of interest) rejected by the (political) builders became the corner stone of the temple."

Early in the spring, the anthracite operators, realizing the seriousness of the lure of higher wages offered by other lines of employment, met the representatives of their employees and, on Apr. 26, after a comparatively brief conference, reached an agreement, supplemental to the agreement of May 5, 1916, by which wages were advanced from 10 to 20 per cent. in different classes of labor, the aggregate effect of which was to increase the cost of production by an average of about 30c. a ton, which was, with the approval of the Federal Trade Commission, added to the price at the mines. The commission, after a thorough investigation of the anthracite industry, had found that the prices obtaining were not extortionate nor were profits, on the average, unreasonable, and on Aug. 23, when the President by proclamation fixed the prices for prepared sizes of an-

thracite, he practically adopted those then prevailing for the larger companies and allowed the "individuals" a differential of 75c. a ton. The prices fixed by the President's order were as follows:

	White Ash Company	White Ash Individual	Red Ash Company	Red Ash Individual	Lykens Valley Company	Lykens Valley Individual
Broken	$4 55	$5 30	$4 75	$5 50	$5 00	$5 75
Egg	4 45	5 20	4 65	5 40	4 90	5 65
Stove	4 70	5 45	4 90	5 65	5 30	6 05
Nut	4 80	5 55	4 90	5 65	5 30	6 05

The price of pea coal was fixed at $4 per ton for white ash with equivalent differentials for red ash and Lykens Valley and "individuals," and this was probably very near the average price obtaining in the region; but by a later order (Oct. 1) of the Fuel Administrator, who had in the meantime been appointed, the price of white ash pea coal was reduced to $3.40, the differentials for red ash, Lykens Valley and the "individual" operators being maintained.

In the fall of the year, as conditions became aggravated, further concessions to labor were found necessary in order to provide for the increased costs of the commodities they bought and to prevent further desertions from the mines, and a conference was held at Washington, the result of which was a further supplemental agreement by which wages were advanced to an extent that increased the average cost of production about 45c. a ton, this agreement being predicated upon the approval of the Fuel Administrator to an equivalent advance in the selling price. The proposition was submitted to the Fuel Administrator immediately upon the signing of the agreement, Nov. 17, and on Nov. 28 he submitted his recommendation to the President. As this incident is somewhat of a history-making character, the letter of Doctor Garfield to the President, the President's order, and the acknowledgment thereof by the committee representing the anthracite operators is given in full.

The following is Doctor Garfield's letter to the President on which the order was based:

Nov. 28, 1917.

Dear Mr. President:

The labor problem in the anthracite mines is not different in any material respect from that in the bituminous fields. Most of the comment in my letter of Oct. 26 is applicable to the anthracite situation. It is therefore unnecessary to repeat it here.

On Nov. 17, after a conference of about two weeks, the anthracite operators and miners reached an agreement, a copy of which I inclose.

In response to my request, the operators' association furnished statements showing in detail the tonnage and actual labor costs since the last wage increase, May, 1917, and the additional cost per ton if the increase of Nov. 17 is added. These figures were based upon an examination of over 68,000,000 tons, or 85 per cent. of the total tonnage estimated for 1917. If the proposed wage increase becomes effective, the increased cost placed upon the operators will range from 26c. per ton to 56c. per ton. A small high-cost tonnage shows additional costs per ton as high as 70c. The weighted average of the above-mentioned tonnage, accurately figured, is 37.2c. per ton. The increased cost to operators producing about 41,000,000 tons, or substantially one-half of this year's tonnage, will be 35c. and upward per ton.

I, therefore, respectfully recommend that the prices fixed by your proclamation of Aug. 23, 1917, as modified with respect to the price of pea coal by my order of Oct. 1, 1917, be uniformly increased in the sum of 35c. per ton, provided, however, that these increases shall not apply to any coal sold at the mine under existing contract containing a provision for an increase for the price of coal thereunder, in case of an increase in wages to miners.

In this connection, I desire to say that it is my expectation to order the reduction in anthracite prices which has been regularly given beginning Apr. 1, 1918.

I desire also to call attention to the fact that the Board of Conciliation created by the Commission appointed by President Roosevelt in 1902, has performed its tasks so acceptably to all concerned that there is no occasion for the introduction of an automatic penalty clause as provided in the case of the bituminous field, nor was the inclusion of any such clause provided for in the agreement of Nov. 17 between the operators and the mine workers.

Respectfully submitted,

H. A. GARFIELD,
United States Fuel Administrator.

PRESIDENT WOODROW WILSON,
The White House,
Washington, D. C.

THE PRESIDENT'S ORDER

Dec. 1, 1917.

Acting on a recommendation from Dr. Harry A. Garfield, Fuel Administrator, the President has issued the following executive order:

THE WHITE HOUSE,
Washington, D. C.,
Nov. 28, 1917.

The scale of prices prescribed Aug. 23, 1917, by the President of the United States for anthracite coal at the mines, adjusted as to pea coal Oct. 1, 1917, by order of the United Statess Fuel Administrator, is hereby amended by adding the sum of thirty-five (35) cents to each of the prices so prescribed or adjusted, provided, however, that this increase in prices shall not apply to any coal sold at the mines under an existing contract containing a provision for an increase in the price of coal thereunder, in case of an increase of wages paid to miners.

This order shall become effective at 7 a.m. on Dec. 1, 1917.

WOODROW WILSON.

ACKNOWLEDGEMENT BY OPERATORS' COMMITTEE

New York, Dec. 3, 1917

HON. H. A. GARFIELD,
United States Fuel Administrator,
Washington, D. C.

Sir:

Although our committee has received no formal notice from you respecting the advances in prices of anthracite authorized by the President upon your recommendation to offset the proposed increases to labor, we have observed the press announcement which we assume to be accurate. In the present crisis we have felt it incumbent upon us to act promptly and have today held a meeting of as many as possible of the operators affected by this price order.

The great difficulty we have encountered, you can well appreciate, arises from the fact so well stated in your letter to the President that "the increased cost to operators producing about 41,000,000 tons, or substantially one-half of this year's tonnage, will be 35c. and upward per ton"; or, in other words, that the permitted increase compels these producers to assume from their own pockets without possibility of recoupment, the excess allowed to labor above 35c. per ton.

This posture of affairs, so clearly and frankly indicated in your letter, left us only one ground of appeal to those producers whose demonstrated increased costs exceed the allowance—namely, an appeal to their loyal spirit of cooperation in the public interest even in the face of a substantial financial loss to themselves.

We are pleased to say that that appeal has been successful, and we are in a position to advise you that those operators have undertaken to sell at the prices named in the President's published order notwithstanding the fact that they dissent from your conclusion as being without justification on the record submitted to you.

Mindful of the period of uncertainty which followed the bituminous settlement, and believing that our employees and the consumers of our product are entitled to prompt information of this settlement, we are giving this letter to

the press simultaneously with its dispatch to you in the confidence that you will approve our course in this respect.

Respectfully,

(Signed) S. D. WARRINER,
W. J. RICHARDS,
J. B. DICKSON,
Committee.

No changes were made in the differentials for red ash or Lykens Valley coal, nor to the individual operators, and the prices for prepared sizes, including pea for the last month of the year, were as follows:

	White Ash Individual	White Ash Company	Red Ash Individual	Red Ash Company	Lykens Valley Individual	Lykens Valley Company
Broken	$4.90	$5.65	$5.10	$5.85	$5.35	$6.10
Egg	4.80	5.55	5.00	5.75	5.25	6.00
Stove	5.05	5.80	5.25	6.00	5.65	6.40
Nut	5.15	5.90	5.25	6.00	5.65	6.40
Pea	3.75	4.50	3.85	4.60	4.10	4.85

The prime factor in producing the abnormal conditions that affected the anthracite industry, as well as all other industries in 1917, was, of course, the entrance of the United States into what is now the world war, but this factor, however powerful as it was, was indirect in its influence on the demand for and production and distribution of anthracite. Anthracite is now relatively unimportant as a manufacturing fuel. Including the steam sizes that are used for the heating of office buildings, hotels and apartment houses as domestic coal (and where so used they really are domestic fuel) and considering all the lump and broken coal, most of which is used in the manufacture of water gas, as industrial fuel, probably 70 per cent. of the output may be considered as used for domestic purposes.

Naturally, therefore, anthracite would not be so immediately and directly influenced by the sudden expansion of our manufacturing industries, due to the war's demands, as would bituminous coal. But the bituminous mines, the coke ovens and the railroads were not prepared for, and could not respond to, the unexpected demands upon them, and these conditions have created an industrial demand for anthracite, particularly from brass foundries and similar industries, that could not secure needed supplies of coke. It is not believed, however, that the quantity of anthracite which was used to make up the deficiencies of bituminous coal and coke for industrial fuel has been equal to or even approximated the increased production of 10,000,000 tons over the output of 1916.

Other causes contributed more significantly to the shortage that prevailed in anthracite-consuming communities throughout the year. In the first place it must be remembered that at the close of the winter of 1916-17 the storage yards of the larger companies were practically bare, whereas at the corresponding period in 1916 there were from 4,000,000 to 5,000,000 tons of coal on hand. The "coal year" of 1916 opened with a good surplus in stock; that of 1917 opened with storage yards empty, and the same conditions obtained in the bins of the consumers. The winter of 1916-17 was unusually severe, and was followed by a "late" spring, coal-burning weather continuing in the principal anthracite-consuming territories until well into June. In the Upper Lake region, which is an important anthracite market, there is ordinarily carried forward some 400,000 to 500,000 tons from one year to the other; in the spring of 1917 the docks at the head of the Lakes were bare, and navigation was not opened until a month later than usual. The year, here, then began with a shortage and with a shortened season of navigation in which to make it up. The failure of the supply of natural gas in Ohio created a demand for anthracite from the residents of the affected districts, while of no small importance along the same lines has been the suddenly expanded populations of such manufacturing cities as Detroit, Mich.; Bridgeport, Conn.; Bethlehem and Chester, Penn., and the capital city of Washington. In practically all of these cases the increased demands for anthracite has been for household use. The chief augmentation in demand except for domestic purposes has been from gas companies which, unable to secure their customary supplies of coke for use in the manufacture of water gas, have called upon the anthracite mines to make up the deficiency.

Complaints have been made that undue quantities of anthracite have been taken by the Government to provide for the officers and men at the army posts and cantonments. The total quantity of anthracite requisitioned by the Government up to Dec. 31, including orders from the Navy Department for delivery during the entire fiscal year, had not amounted to 500,000 tons, and there has not been a time since the anthracite operators volunteered to see that the Government needs should be promptly filled that any of the camps have had more than ten days' supply on hand. No injustice has been done to the public by this action of the anthracite operators.

Enough has been said here to show how and why the 10,000,000 tons of increased production has been absorbed. If the mild weather of November had proved a forerunner of similar temperatures for the remainder of the year, little inconvenience on account of coal supply would have been experienced. Unfortunately the last two weeks of the year were made notable by blizzards and by almost unprecedented low temperatures for that season. There was, as a result, much suffering from lack of fuel in some quarters and from apprehension of not being able to obtain supplies in other quarters. There was, however, an abundant supply of coal in transit or tied up at junction points or on sidings to have met the emergency if it could have been moved to destinations and distributed. On Dec. 27 the Government took control of the railroad, and it is now hoped and believed that a freer movement of coal cars will be maintained; it is also hoped that by coöperation of dealers with local administrators an equable distribution to consumers will be effected and panicky conditions brought to an end.

In a review of the anthracite industry in 1917 one action on the part of those in control of the greater part of the production should not be overlooked. And that was the holding down of prices at a time when, if the general tendency had been followed, consumers might well have had cause for complaint. As it was, however, anthracite price circulars were not only not advanced more than the cost of production had increased, but the usual spring discounts were put into effect when there would have been no difficulty in obtaining full circular prices. The United States Bureau of Labor Statistics in its monthly review for October, 1917, presents a table in which it is shown that out of a total of 50 necessary commodities only one shows a lower percentage of advanced price than anthracite, and that exception is one for which the demand is on the decline.

Coal-Mine Accidents in 1917

By ALBERT H. FAY
Mining Engineer, U. S. Bureau of Mines
Prepared and published in "Coal Age" through the courtesy of the Director of the Bureau

THE abnormal conditions under which the coal mines were operated during 1917 are reflected in the accident records to the extent of an increase of about 20 per cent. in fatalities over 1916. There has been and is still an unusual demand on the operators for an increase in coal production, which has been hampered by a congestion in freight traffic and a shortage of labor.

ALBERT H. FAY

Complete data are not available to show definitely whether or not the increase in production will equal the percentage of increase in accidents, nor is it possible to give the number of men employed in 1917. Preliminary reports to the United States Geological Survey indicate that in some states there is a slight increase in the number of men employed, but for the United States as a unit, it is doubtful whether the total number employed will equal the number employed in 1916, which was 734,008. Those mines which were able to secure cars to market their coal were operated on a full-time basis, which adds to the number of days the individual miner could work, thus lengthening the time he was exposed to the mining hazard. The risk encountered by the individual is proportional to the time exposed. Other mines which were not so favorably situated as to dispose of their coal operated only part time. This condition results in an increase of certain dangers, especially those due to gas and falls of roof, which would not obtain in the case of the mine operating full time.

Cause of Labor Shortage

The shortage of labor at the mines is due to the attractive wages in munition factories, enlistments and drafts into the army, a relaxation in immigration and to emigration of many miners early in the war. It has been necessary, therefore, to employ new and inexperienced men from other fields to replenish this shortage.

Many of the experienced mine foremen and safety engineers have either enlisted or been drafted into the army, or secured more remunerative employment elsewhere, with the result that less experienced foremen have been placed in charge of some of the workings. With the exceedingly large demand for coal it has not been possible for the operators and others concerned to give as much attention to accident prevention at the mines as was being done in previous years under normal conditions.

The reports of the coal-mine inspectors to the Bureau of Mines to the close of October show 2104 fatalities at the coal mines of the United States, as compared with 1748 for a like period in 1916, representing an increase of 20 per cent. There were four explosions in November and December which killed 65 as compared with two in 1916 which resulted in the death of 50 men. The returns so far received for the last two months of the year indicate that the percentage of increase will hold for the entire year. The total number of fatalities in 1916 was 2226, to which must be added 20 per cent. for 1917. During 1916 there were 11 mine disasters in each of which five or more men were killed, while in 1917 there were eight such disasters. The 11 disasters in 1916 killed 154 men, while the eight in 1917 killed 256. Table I gives a list of the above disasters.

Table II shows the actual number of fatalities reported to the bureau in 1917 during the first 10 months of the year, together with the fatalities for the corresponding period in 1916. Falls of roof show an increase of 116, or 13.7 per cent., while mine cars and locomotives underground show an increase of 19.75 per cent. Haulage on the surface, which includes both mine cars and railway cars and locomotives, shows an increase of 68.63 per cent., while the total increase for the entire coal-mining industry is 20.37 per cent. The foregoing figures indicate clearly that eternal vigilance is the price which must be paid if accidents are to be kept at a minimum. The least relaxation of safety measures, inspection and supervision; the disorganization of the industry, or an unusual demand for coal, immediately result in higher accident records as shown by the experience of 1917.

TABLE I. COAL-MINE DISASTERS IN THE UNITED STATES IN 1916 AND 1917 IN WHICH FIVE OR MORE MEN WERE KILLED

Date	Name of Mine	Location of Mine	Nature of Accident	Killed
1916 Feb. 8	Lance	Plymouth, Penn.	Mine explosion	7
1916 Feb. 11	Jefferson and Clearfield No. 2	Ernest, Penn.	Mine explosion	27
1916 Feb. 29	Davis No. 42	Kempton, W. Va.-Md.	Mine explosion	16
1916 Mar. 9	Hollenback	Wilkes-Barre, Penn.	Mine explosion	6

Bituminous Coal in 1917

By C. E. LESHER
United States Geological Survey, Washington, D. C.

C. E. LESHER

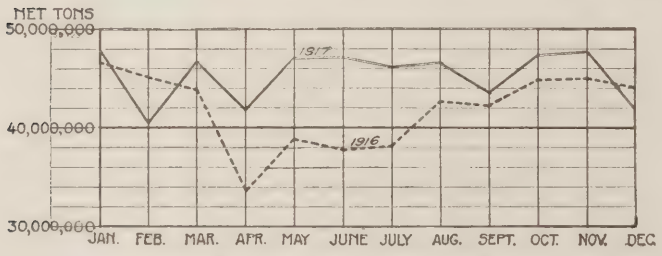
THE production of bituminous coal in the United States in 1917 is estimated at 544,000,000 net tons, an increase of 41,000,000 tons, or 8.3 per cent. over 1916, thus establishing a new high record. Early in the year the mark was set at 600,000,000 tons, and for the first three months after the United States entered the war the increases in the rate of output were such as to warrant the belief that that mark might be attained. Beginning in July, however, a number of factors were introduced that adversely affected production, and by the middle of October it was apparent that the most that could be expected would be 550,000,000 tons, which record would have been reached had it not been for the extremely severe weather in December, affecting not only transportation but to some extent surface operation at the mines. The estimated output in December was the lowest in any month of 1917, except April.

A quantitative measure of the increase in demand for bituminous coal is, of course, difficult to obtain. The largest consumers of coal are the railroads, and their increase in consumption was between 15,000,000 and 20,000,000 tons over 1916, of which from 2,000,000 to 3,000,000 tons was taken up from storage on hand at the beginning of 1917. The increased demands for coal by the railroads may be considered to have been supplied.

Coal used in making coke increased 3,100,000 tons, the estimated output of coke in 1917 being 56,600,000 tons, of which 22,600,000 tons, or 40 per cent., was byproduct, and 34,000,000 tons, or 60 per cent., was beehive. This increase in production does not, however, measure the increase in demand, for throughout the year the output of Connellsville coke was below that for 1916, and the byproduct output was at times seriously curtailed through lack of coal.

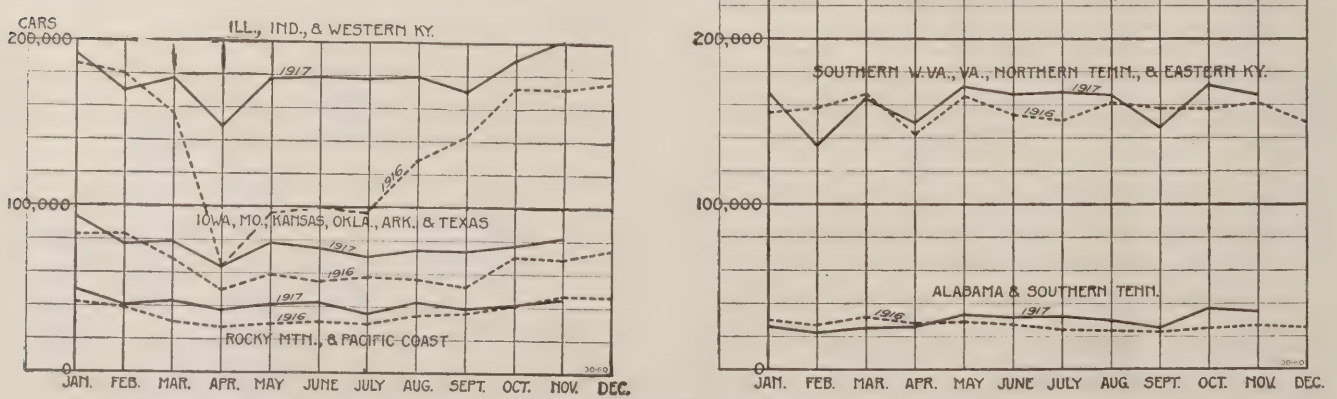
The largest increase in demand and in consumption was in general industry. Comparable figures collected and compiled for the United States Fuel Administration show that the increase in consumption in 1917 over 1916 by manufacturing and industrial plants consuming about 60 per cent. of the bituminous coal in that part of the country east of Illinois and north of Maryland (exclusive of New England) was between 14 and 15 per cent.

The percentage increase shown by these figures, by states, are as follows:



State	Percentage	State	Percentage
New York	4.9	Maryland	21.4
Pennsylvania	21.6	Ohio	15.4
New Jersey	16.8	Michigan	6.9
Delaware	31.4	Indiana	9.1

Weighted average increase, 14.6 per cent.



These figures are of course subject to modification as more complete returns become available.

It is significant that the territory reporting the largest increase in consumption—namely, the Atlantic seaboard from Baltimore to New York—is the region in which the shortage of coal, during the past few months, has been the most acute, and that the coal fields on which this territory depends mainly for its supply; that is, those in central Pennsylvania, Maryland and West Virginia, did not show a gain in proportion to that of the country as a whole.

In explanation of this it is to be noted that the

MONTHLY OUTPUTS IN 1916 AND 1917

COMPARATIVE PRODUCTION IN DIFFERENT COAL-PRODUCING DISTRICTS BY MONTHS

coal for consumption in the region supplied by Pennsylvania, Maryland and West Virginia was about 4,000,000 tons in excess of the gain in production in those fields because coal for the Northwest via the Lakes, and coal for foreign export and foreign bunker from the producing districts of Pennsylvania, Maryland and West Virginia was less by that amount in 1917, compared with 1916.

The most notable gain, and the greatest in total tonnage, was in Illinois and Indiana. In Alabama production beginning in May was greater than in the corresponding months of 1916; in all the coal-producing states west of the Mississippi production in 1917 was at a higher rate than in 1916, and Michigan recorded an increase.

The World's Coal Production

Much interest attaches to a comparison of figures on world coal production compiled in the normal period just preceding the war by the Research Division of the Bureau of Foreign and Domestic Commerce.

These figures show that Belgium, small as it is in territory, had the second largest per capita coal consumption. This evidences the wonderful industrial activity of Belgium, especially as a great deal of its industrial work involves hand labor.

The United States has been producing practically twice as much coal as the next largest producer, the United Kingdom, and more coal than the United Kingdom, Germany and France combined. England and Germany were important exporters of coal before the war period, supplying much coal to the West Indies and South America who now obtain it from the United States.

Canada has imported heretofore more coal than it has produced. Austria-Hungary has also been a heavy importer of coal as well as Italy, Sweden and Spain. Japan has been a fairly heavy exporter, and Belgium in its earlier days both imported and exported in considerable quantity. The production and per capita coal consumption of the nations of the world is as follows:

Countries	Annual Production Tons	Consumption Per Capita Tons
Australia	11,730,000	1.17
Austria-Hungary:		
Austria	15,544,000	
Hungary	1,269,000	0.52
Belgium	22,603,000	3.35
British India	14,706,000	0.50
British South Africa:		
Cape of Good Hope	67,000	
Natal	2,469,000	
Orange Free State	469,000	0.95
Transvaal	4,243,000	
Canada	12,958,000	3.32
France	39,745,000	1.48
Germany	172,065,000	2.12
Italy		0.28
Japan	17,349,000	0.24
New Zealand	2,178,000	2.23
Russian Empire	25,998,000	0.19
Spain	3,605,000	0.31
Sweden	355,000	0.96
United Kingdom	260,416,000	3.83
United States		

The Bureau of Foreign and Domestic Commerce also notes that the definitely known coal deposits of the world total 716,154 million (metric) tons, and the probable and possible coal deposits are 6,682,139 million (metric) tons.

The total of the definitely known deposits, the probable, and the possible deposits, is therefore 7,397,533 million (metric) tons. Of this total, Australia has 170.41 billion, Asia 1,279.58 billion, Africa 57.85 billion, America 5,105.53 billion and Europe 784.19 billion metric tons. Thus, America has about seven tenths, Asia not quite two tenths, and Europe about one tenth of the world's coal supply.

The following figures represent coal deposits of Europe in millions of metric tons:

Country		Country	
Germany	423,356	Bulgaria	388
Great Britain	189,530	Italy	243
Russia	60,106	Sweden	114
Austria-Hungary	59,169	Denmark	50
France	17,583	Greece	40
Belgium	11,000	Roumania	39
Spain	8,708	Portugal	20
Holland	4,402	Spitzbergen	8,750
Serbia	529		
		Total	784,190

The principal coal deposits of North America are held by the United States with 3,838,657 and Canada with 1,234,209 millions of (metric) tons. It is calculated that the entire coal supply of the world will be exhausted in 2000 years.

Workmen's Compensation Awards Are Higher Than in 1916

Accident reports indicating the injury of 232,425 workers in Pennsylvania were received during the year 1917 by the Department of Labor and Industry, according to an announcement made by Acting Commissioner Lew R. Palmer. Of the total number of injured workers, 3152 died from their injuries, an average of approximately one death for every 74 industrial casualties reported.

From the accident records compiled in the Bureau of Statistics and Information, and Bureau of Workmen's Compensation of the Department of Labor and Industry, up to Jan. 1, the total amount of workmen's compensation awarded and paid for industrial fatalities and disability cases in 1917 amounts to $7,161,094. The same total in 1916 was $4,224,875.

The total amount of compensation paid in nonfatal cases during 1917 was $2,480,581, while $645,281 was paid in fatal cases. Compensation awarded in fatal cases during 1917, and payable during a term of years, was $4,680,513, an average of $2272 compensation cost for each industrial accident.

Compensation costs for permanent disability of workers during 1917, according to agreements filed in accordance with the compensation law, are as follows: Loss of hand, 182 cases, total cost, $259,943; loss of arm, 52 cases, total cost, $84,866; loss of foot, 71 cases, total cost, $108,616; loss of leg, 49 cases, total cost, $81,753; loss of eye, 447 cases, total cost, $475,954.

The total number of workmen's compensation agreements approved during 1917 was 75,076. The same total in 1916 was 54,500. Of the 1917 agreements, 73,016 covered nonfatal cases, while 2060 were for fatal cases. Claim petitions for compensation filed in 2964 cases during 1917 were referred to referees and disposed of as follows: Awards, 799; disallowed, 650; dismissed, 993; withdrawn, 228; pending, 294. During the year 1916 there were 1730 claim petitions filed. Other petitions filed during 1917 include 612 for termination; 337 for modification and a total of 112 for reopening of cases.

The National Coal Association

By J. D. A. MORROW
General Secretary, National Coal Association, Washington, D. C.

A CONCRETE realization of a long deferred hope is the National Coal Association. For years coal men felt that a national organization would be distinctly beneficial, but it was not until the industry came under Government control that such an association was formed. The National Coal Association began its work about Oct. 1, 1917. Its membership is composed primarily of local associations of operators such as the Indiana Coal Trade Bureau, the Pittsburgh Coal Producers' Association, the Central West Virginia Coal Operators' Association, and other similar organizations throughout the producing fields. In addition it has individual members in fields where there are no local associations or where it is not practicable for some good reason for a company to hold membership in a local association. It is the desire of the association to include every coal operator in the United States, and the door to membership is always open. When first organized its members had a total annual production of approximately 120,000,000 tons; at the present time, the annual output of its members is 300,000,000 tons, and this total is increasing every day.

The affairs of the association are managed by a board of sixteen directors, intended broadly to represent the larger producing districts. Its purposes are two-fold: First, to give the United States Fuel Administration and other agencies of the Government the fullest coöperation and assistance in the present national emergency; and second, to carry on constructive work of definite and substantial benefit to the industry.

With peace it is now expected that the industry will return to private control, as before the war, but it is hoped that a better understanding will have been established between the coal producers and the authorities in Washington which will be lasting, and it is certain that in the readjustment of industrial activity in the United States after the war the National Coal Association may be of great value to every producer of coal.

Information Service to Members

One of the most important features of the association's work is its information service. This service endeavors to inform the members accurately as to developments in Washington which affect their interests. They are informed of Fuel Administration rulings and announcements, reports of the Federal Trade Commission, the Internal Revenue Bureau, the Interstate Commerce Commission, and of other governmental agencies which affect the industry, through the *Daily Digest*, which publication is mailed to each member every day.

The information service also undertakes to answer specific inquiries of members for information. Another branch of its work is the dissemination of facts of general educational value to the public. The association collects from its member associations telegraphic advice daily as to the car supply and car shortage, and conditions of railroad transportation in their respective districts. This information is assembled daily into a report which is utilized by the Fuel Administration, the Director General of Railroads, the Interstate Commerce Commission, and other Governmental bodies, in the effort to obtain improvement. This material is also utilized in press announcements and statements emphasizing the causes of the coal shortage, giving an accurate portrayal of the conditions in the coal-producing districts and impressing upon the public the all-important fact that the failure to obtain coal is not due to any fault or incapacity of the mine operators, but has been directly and solely due to the failure to furnish sufficient transportation to the mines.

This is typical of the educational work which the information service is carrying on. It is undertaking to make the public understand the difficulties and costliness of coal production under present conditions so that the consumer will have a better understanding of the fact that mine prices for coal must be, of necessity, higher than heretofore, and that after all the price paid to the mine operator is but a small proportion of the final cost to him.

Association Has Traffic Department

It is the conviction of every enlightened coal operator today that the unfortunate public sentiment toward coal operators is due largely to a misunderstanding of the conditions under which they are now working, and that the only cure is to give the fullest publicity to the facts. The National Coal Association is undertaking this work.

In order to obtain better treatment for the coal-mining industry from the railroads the association has organized a traffic department. It has been contended by coal producers for months that the industry was being discriminated against in favor of other classes of shippers. The traffic department has been instrumental in bringing convincing facts in support of this contention to the attention of Dr. Garfield, Judge Lovett, the Director General of Railroads and the Interstate Commerce Commission. Moreover, many matters relating to embargoes, mine supplies, mine ratings, car distribution, railway fuel supply, priority and other general transportation and traffic features are being constantly brought to the attention of the various Federal, state and local boards and commissions, all for the purpose of assisting in increased production of coal.

One of the fundamental causes of the extremely difficult competitive conditions which have previously prevailed in the coal business was the lack of proper cost-accounting methods on the part of the producers. That condition still prevails, and unless remedied will be the cause of as much trouble in the future as in the past. The National Coal Association has had a splendid committee of coal cost accountants and practical coal men devising a cost-accounting manual for the use of the industry. It is desired to make this manual conform as closely as possible to the form of report required by the Federal Trade Commission. When that report form is issued the committee will publish its manual and the association will establish a cost-accounting department to assist local associations and individual operators.

Connellsville and Byproduct Coke Industries in 1917

By B. E. V. LUTY
Pittsburgh, Penn.

SYNOPSIS—*The year 1917 was at once profitable and unpleasant. The production from the Connellsville region has steadily decreased because of insufficient transportation. The byproduct production on the other hand steadily increased with good prospects of still further large advances to be made in the coming twelvemonth.*

THE Connellsville coke industry had a remarkable career in 1917—one that was profitable indeed, but not altogether pleasant. It was late in November, 1916, that the railroads first failed to move all the Connellsville coke that required movement, and from then until the end of 1917 there was no time at which the coke movement was adequate to the requirements of consumers, chiefly the blast furnaces of the Pittsburgh Valley and Lake front districts.

By the beginning of 1917 spot furnace coke had already advanced to $10 a ton, and at no time in the early months of the year did it drop much below that figure. Just after Independence Day there were sales at $16, the top point not only in 1917 but in the whole history of the Connellsville coke industry. There were a few contracts in force for the first half of the year at $2.75, secured by consumers who had had the courage, the preceding September, to enter into contracts at such a high price. Those who did not have the courage paid the other prices.

Why Was There a Shortage of Coke?

There was a question all the year why there was not more coke and the various interests answered the question each according to his fashion. Consumers were strongly inclined to the opinion that the operators were purposely restricting production and the only flaw in the argument was that that would be the first time Connellsville operators had ever been able to agree among themselves on anything. The operators attributed the scant production at one time to labor shortage and at other times to car shortage.

In June the priority authorities at Washington issued an order on the railroads in favor of the movement of Connellsville coke, but there were no discernible results. The railroads insisted that when they furnished more cars the coke operators did not load them, the coke operators rejoining that their labor had migrated to other employments when there were not enough cars, and that the only thing to do was to continue full car supplies until the labor could be gotten back. Toward the close of the year the operators insisted that they had ample supplies of labor, but by that time the railroads were powerless to do anything, all divisions being badly congested.

Statistics presented by the Connellsville *Courier* of shipments from the Connellsville and lower Connellsville region will show how the movement fell off in 1917. The figures refer to net tons:

	1916	1917
First quarter	5,613,831	4,422,714
Second quarter	5,641,215	4,821,399
Third quarter	5,326,192	4,574,772
Fourth quarter	5,073,264	3,987,296
Year	21,654,502	17,806,181

The decrease from 1916 to 1917 was 17.7 per cent., while the decrease from the best quarter of 1916 to the poorest quarter of 1917 was 29.4 per cent.

Decreased Pig-Iron Production

In 1916 about 45 per cent. of the coke consumed by iron blast furnaces was Connellsville. The blast furnaces of the country operated practically full, the total production of pig iron, including small quantities of anthracite and charcoal iron, being 39,434,797 gross tons. In 1917 the production was about 38,600,000 tons. There should have been a large increase, for in 1916, in May and later, four new blast furnaces were completed, and in 1917 14 additional furnaces were finished, the major portion of them in the middle months of the year. The 18 new furnaces had a capacity to produce more than 3,000,000 tons of pig iron, and it is safe to assert that if there had been a full supply of coke throughout the country the 1917 pig-iron production would have been 41,000,000 tons.

There was some shortage of coke apart from the shortage of the Connellsville product, but if the Connellsville region had shipped as much coke in 1917 as in 1916 there would have been plenty for all the furnaces. The region was not really required to ship altogether as much, because a number of furnaces that had been depending on Connellsville coke completed byproduct ovens. In several cases, however, they took Connellsville coal instead, and the railroads had to haul that coal, so that it would not be fair to blame the shortage of coke entirely upon the railroads, even though it were proved that the coke works would have been able to ship the coke if the cars had been provided.

Government Prices

The Lever, or "food control," act approved Aug. 10, 1917, empowered the President to fix prices on coke. He had no such authority with respect to iron and steel, except such as would be bought by the Government. An agreement was sought with the iron and steel producers, on the basis of their naming "one price for all," the Government, its Allies and the general domestic trade. A meeting of the iron and steel interests was called for Sept. 21, the coke producers being also invited. The War Industries Board sought the lowest prices the producers would offer, and a schedule was drawn up covering certain prices for iron ore, pig iron and steel products, coke being included, at $6.50. This schedule was presented to the President, and on Saturday, Sept. 22, it was confidentially announced to those

who had remained in Washington that the President had approved the iron and steel prices, but had cut 50c. off the coke price. On Sept. 24 public announcement was made by the Government.

Thus it was the President who set the price of $6 on coke. It was not an agreement, as $6.50 was the price the coke producers had agreed upon. The Lever Act did not prescribe the manner in which the President should reach his decision, nor the manner in which he should announce it. The quibble that a few coke operators afterward raised, that they were not bound by the $6 price, did no credit to their intelligence, and still less to their patriotism.

On Nov. 10 the Fuel Administration made its own announcement, fixing maximum prices on beehive coke east of the Mississippi River, at $6 for furnace, $7 for foundry, 72-hr. selected, and $7.30 for crushed, over 1-in. On Nov. 21 byproduct coke prices were announced, except for New England, at the following base prices: Run of ovens, $6; selected foundry, $7; crushed, $6.50, the freight from the nearest competitive beehive production to the byproduct ovens to be added to these base prices to arrive at the price for byproduct at the byproduct ovens. On Nov. 27 a special rate was made for New England byproduct coke, there being an extra allowance of 7c. per ton of coke for each 5c. per ton of coal over 60c. per long ton of water freight on the coal used. On Dec. 31 it was prescribed that the prices already set should continue, with the mandate that "no producer or vendor of coke shall ask, demand or receive a higher price than the maximum price established by order of the Fuel Administration for any coke delivered on contracts or sales on or after Sept. 24, 1917."

Byproduct Coke Industry Growing

The following table shows approximately the growth of the byproduct coking industry in the past four years, the figures referring to the number of retorts:

	Increase	At Close
1914	321	5,809
1915	459	6,268
1916	488	6,756
1917	739	7,495

At the end of 1917 there were about 1700 byproduct ovens being built, fully three-fourths of them being expected to be completed during the first half of 1918.

In the past two years the average output per oven has been approximately 3000 short tons a year. Making allowance for lost time not caused by conditions at the byproduct plant itself the capacity would be several hundred tons greater. Inasmuch as some of the ovens are quite old, as byproduct progress goes, the most modern plants undoubtedly have a capacity of fully 4000 tons a year.

The largest byproduct plant in the world is being built at Clairton, Penn., by the Carnegie Steel Co., and yet the plant being built, comprising 640 retorts, is only one-half the size of the plant as contemplated eventually. It is expected that the 640 ovens will be completed about Apr. 1, 1918. The estimated output is 2,740,000 short tons of coke a year, equal to 4280 tons per oven. The coal consumption is figured at 4,100,000 net tons, showing the modest expectation of a 67 per cent. recovery. Apart from the standard coke to be made it is expected there will be produced 245,000 tons of coke breeze, 43,000 tons of sulphate of ammonia, 37,500,000 gal. of tar and 9,000,000 gal. of light oil. The surplus gas, which will be used at the company's steel works in the neighborhood, is set at 60,000,000 cu.ft. a day, or nearly 7000 cu.ft. per ton of coke produced, almost double the expectations of a few years ago on the basis of the coal then in favor.

Apart from its size this plant is of particular interest. The Steel Corporation, although it owns Connellsville coke ovens, and many of them, had lighter blast furnace operations in 1917 than almost any other important interest, by reason of there not being enough coke, the shortage being attributed to insufficient railroad service. The Clairton plant will provide much more coke than the amount by which the Steel Corporation has been short and it will provide it without requiring any service whatever on the part of the railroads, as the coal will be brought to Clairton by water and the coke will be moved by the Carnegie Steel Co.'s own railroad to its nearby blast furnaces.

Connellsville Coke in 1917

The Connellsville coke region never operated for a continuous twelvemonth under so great a stress as during the year 1917. The demand for its product exceeded in volume any previous experience, and continued for a longer period. Stimulated by phenomenal prices; harassed by a labor shortage; held down by inefficient operation of plants and by interrupted and inadequate transportation—under all these handicaps the region has made a record and maintained its supremacy as a producer of the standard metallurgical fuel of the world.

Although the Connellsville region's output of 17,806,181 tons of coke in 1917 was less by 3,848,321 tons, or 13.1 per cent., than in 1916, its value was $111,288,631, which is $55,520,016, or 99.5 per cent. more than the value of the output of 1916.

The Connellsville and Lower Connellsville regions produced coke in relatively the same proportions in 1917 as they did in 1916—namely, 54 per cent. by the former and 46 per cent. by the latter. The operating conditions which prevailed during the year may possibly be well expressed in the words of a plant manager who stated: "Have all our ovens fired and are running them the best we can."

The following table notes in detail Connellsville production:

PRODUCTION OF CONNELLSVILLE COKE—BOTH REGIONS—FOR 1917

	Merchant	Furnace	Total Tons	Connellsville Region	Lower Region	Both Regions
January	597,765	966,408	1,564,173	877,313	686,860	1,564,173
February	518,254	770,509	1,288,763	686,908	601,855	1,288,763
March	614,119	1,004,850	1,618,969	918,226	700,743	1,618,969
April	594,506	963,741	1,558,247	868,796	689,451	1,558,247
May	616,622	1,033,367	1,649,989	912,035	737,954	1,649,989
June	580,616	983,000	1,563,616	859,947	703,669	1,563,616
July	581,154	958,777	1,539,931	841,354	698,577	1,539,931
August	598,931	956,004	1,554,935	842,130	712,805	1,554,935
September	566,145	898,055	1,464,200	784,884	679,316	1,464,200
October	584,060	925,843	1,509,903	809,667	700,236	1,509,903
November	535,583	814,791	1,350,374	721,190	629,184	1,350,374
December	481,255	740,002	1,221,257	680,468	540,789	1,221,257
Total	6,869,010	11,015,347	17,884,357	9,802,918	8,081,439	17,884,357

As regards oven activity, both the merchant and furnace interests began the year with 89 per cent. of their ovens in blast, increasing slightly to a maximum in midsummer and dropping off gradually toward the close of the year.

Never before in the history of the Connellsville coke trade has coke been delivered at such widely varying

prices as during 1917. The average price realized for the furnace and foundry coke shipped from the Connellsville regions during 1917 was $6.25 per net ton at the ovens. Compared with the average of $2.58 for 1916 output, the increase was $3.67 per ton, or 142.2 per cent. over the previous year.

The transportation situation dominated the oven activity, for only once did the car supply really catch up with the region's capacity to produce; and that satisfactory state of affairs was merely a matter of about ten days. The car supply maintained from month to month an average rarely exceeding 65 to 70 per cent., some months falling to 54 per cent. and lower. Because of the chronic shortage of cars the actual operating efficiency of the coke plants was rarely above 70 per cent. and most frequently around 60 to 65 per cent. of the region's capacity.

Governmental regulation of the price of coke was effected on Sept. 24 when it was announced on behalf of the President that the coke price would be $6. It was not until Nov. 10 that the Fuel Administration settled the question of a differential on foundry coke announcing $6 for furnace, $7 for foundry coke (72-hour selected).

One of the most important achievments in the history of the Connellsville region was brought about after numerous hearings before Government commissions. This was the removal of all differentials against the Connellsville regions eastbound and westbound on both commercial and Lake cargo coal—thus securing more equitable freight rates on coal shipped to the byproduct coking plants in both eastern and western sections of the United States.

Coal Production in the United States in 1917

The following table has been compiled largely from data communicated by the various state mine inspectors, estimates having been made only where no such statistics were available, but in all cases upon the basis of reliable information:

PRODUCTION OF COAL IN THE UNITED STATES

States	1916* Quantity, Short Tons	1917 Quantity, Short Tons
Alabama	18,086,197	21,000,000
Alaska	13,073	61,000
Arkansas	1,994,915	1,867,802
California, Idaho and Nevada	7,240*	5,000
Colorado	10,484,237	12,433,129
Georgia	173,554	135,000
Illinois	66,195,336	(e) 85,700,000
Indiana	20,093,528	25,013,021
Iowa	7,260,800	7,500,000
Kansas	6,881,455	7,500,000
Kentucky	25,393,997	26,125,000
Maryland	4,460,046	4,000,000
Michigan	1,180,360	(a) 1,308,947
Missouri	4,742,146	5,000,000
Montana	3,632,527	(c) 4,400,000
New Mexico	3,793,011	(b) 4,113,544
North Dakota	634,912	689,000
Ohio	34,728,219	38,000,000
Oklahoma	3,608,011	3,861,697
Oregon	42,592	43,000
Pennsylvania, bituminous	170,295,424	170,209,231
South Dakota	8,886	10,848
Tennessee	6,137,449	6,500,000
Texas	1,987,503	2,650,000
Utah	3,567,428	4,051,210
Virginia	9,707,474	(c) 9,000,000
Washington	3,038,588	3,965,000
West Virginia	86,460,127	(a) 79,806,652
Wyoming	7,910,647	8,847,748
Total bituminous	502,519,682	533,796,829
Pennsylvania anthracite	87,578,493	99,604,960
Grand total	590,098,175	633,401,789

* United States Geological Survey figures. (a) For fiscal year ending June 30. (b) Fiscal year ending Oct. 31. (c) Fiscal year ending Nov. 30. (e) Estimated.

Minecdotes

The Story of the Helpless Helper

The superintendent and the master mechanic were in the shop arranging for the repair of a broken casting when they were interrupted by a helper asking information over a trifling detail in regard to the repair job he was working on. After the master mechanic had explained at length, and the man had left, the former remarked with a sigh: "I declare, I wish I knew what to do with such fellows as that. He is a hard worker; always does what I tell him, but I swear he can't screw a nut on a bolt without I make a plan of it for him."

"Let me tell you a little story," replied the superintendent, "and maybe it will help you out. Several years ago I had a job as mine boss in a mine in New Mexico, and as it only rained down in that country about once every two years, the company had a couple of men—*mozos* they call them down there—to water the grass and take care of the yards around the houses.

"Well, the fellow I had was an old Mexican who would do anything in the world you told him—provided you told him often enough. I suppose he had watered the grass for 20 years, but nevertheless I would still have to tell him every day to water it.

"Finally, I got peeved at him one day when I found him piddling around instead of doing his work, and proceeded to bawl him out. I told him that the first day I had to tell him to water the grass again I was going to get rough with him, and I meant it.

"Well, everything went along smoothly for a month or so and old Poncho was as regular as a clock. I did not have to tell him once. Then a miracle happened one day; it started to rain, a good soaking downpour, and when I went home about five I be dog-goned if the old sinner was not out in the yard in all the wet still watering the grass!

" 'For the love of the Virgin, Poncho,' I told him, 'what in the world do you want to water the grass for when it rains?' "

" '*Pues, Senor,*' he says, 'didn't you tell me if I didn't water it every day you would knock my block off?' "

"I told him that maybe I had, but that the Good Lord had provided him a head, even if it was empty, to use in such emergencies. So you see Poncho was like lots of men who get the habit of allowing the other fellow to do their thinking for them. That is the trouble with your helper. I expect if you would refuse to allow him to depend on you for every little detail and make him work out his own problems, even if he makes mistakes some times, it would make a better man of him."

[*Coal Age* will pay for and publish anecdotes such as the foregoing, provided the stories are of the mine and have the proper coal-mining "flavor." If they point a moral, so much the better. Dig down into your experiences and share with the many readers of *Coal Age* the humorous incidents you have witnessed in your duties around the mine, whether it be above or underground.—Editor.]

The 1917 Coal Trade of the Northwest

By W. L. KIDSTON
Seattle, Wash.

SYNOPSIS—*The Northwestern coal industry during 1917 rose from the estate of pauper to that of prince and was then dethroned, through Government price fixing. The year was an active one and scarcely ever did the supply equal the demand.*

WHILE the coal trade was probably the first industry in the Northwest to feel the effects of the world war, the stimulation of greater demands did not make itself apparent until well along in 1916, or until the orders for manufactured goods which flooded the Eastern markets began to overflow toward the West. It was not therefore until the commencement of 1917 that coal mine operators in the Northwest began to materially increase the production of their mines in order to meet the ever-increasing orders for fuel from new and enlarged manufacturing plants and transportation companies.

New flour mills were established and existing ones were enlarged, the shipbuilding industry in Seattle alone increased from $5,000,000 in 1916 to $150,000,000 worth of ship contracts in 1917; the copper and other metalliferous mines of the Northwest increased their production tremendously, practically the entire cycle of industry suddenly found every wheel turning and the consequent demand for the fuel to turn them as suddenly increased. Railroads were taxed to capacity and every available car and locomotive was placed in service. High rates for coastwise and overseas tonnage drew idle ships from their berths and brought every hull which would hold together from the tideflats of the Coast to be converted into steam cargo carriers. The increased coal consumption of railroads and ships alone taxed the operators and the early months of the year witnessed demands greater than the supply. This was accompanied by a steady increase in coal prices.

Coal Has to Compete with Fuel Oil

For years it has been freely predicted that the coal mines of the Northwest would go out of business as a result of the development of hydro-electric energy and fuel oil, and as a matter of fact coal production has shown a reduction from year to year. With coal from British Columbia entering the Northwest duty free and selling at lower prices than local operators could produce it, added to the encroachment upon its natural field by oil and electric energy, and the gradual increase of wood as a fuel, the coal business of the Northwest previous to 1917 faced a doubtful future.

Coal was an enigma. Late in 1916 the California oil fields began to experience a greater demand than they could supply and gradually curtailed their shipments to the Northwest. The placing of huge orders for fuel oil for the Navy caused a sudden withdrawal of this fuel and this section suddenly realized it was in for a cool winter if sufficient coal could not be secured. As a result there was a wild scramble for what was then literally "black diamonds." Apartment houses, industrial plants and others hastily converted their boilers to coal burners, pocketing their chagrin, and in some cases huge expense, with as good grace as could be expected under the circumstances.

Labor strikes in British Columbia tied up production, the Canadian coal surplus was needed at home and shipments across the border ceased almost entirely. Northwest users of British Columbia coal were cut off from supplies at a time when their plants were running to capacity and making greater profits than ever before.

"Local Mines Will Come To Rescue" stated a headline in a Seattle newspaper, and the Washington coal operators enjoyed another laugh for already their mines were producing to capacity. The demand on Northwestern mines increased over 50 per cent. in the first three months of 1917 and this had mounted to 100 per cent. in the first six months and the prophecy of *Coal Age*, in the July 21 issue, that "The Washington coal field soon will be asked to supply eight or ten million tons of coal annually instead of three or four million" appeared a fact.

Coal Comes Into Its Own

Prices began to climb with the indication of a certain shortage. Lumber mills were tied up by a strike for weeks and wood for fuel became scarce. Wood burners began to look to the coal operator, as had all other fuel users who had contributed to the precarious position of Northwestern coal mines in years previous. The coal operator who did not enjoy the humor of the situation thrust suddenly upon him was indeed a sober one unless his sense of the fitness of things had been dulled by months of worry, continual trouble and the constant contemplation of a future which was doubtful in the extreme, or because of the gravity of the situation which early manifested itself.

From the depths of dejection over the ever-decreasing demand, narrowing lines of their markets, labor troubles, increasing cost of production and lower prices for coal, to a full flood of prosperity, with high prices, mines operating full time and orders far in excess of production is the brief summary of the advance of the coal trade in the Northwest in the past twelve months. Verily Old King Coal, after many years of ups and downs came into his own with a vengeance during 1917.

The coal business had hardly recognized its new prosperity when the contract with labor in Washington, with several months yet to run, was broken. The demand was met only to be again broken in a few months and met again until Washington mines were paying a higher scale of wages than any other state in the union and before the year was through Government orders permitted a general wage advance to hit the operators again. During this time two wage advances were made in Montana and one in British Columbia.

Not content with absorbing most of the extra profit in this manner fate decreed that the war demand and quarrels of railroads should take every available railroad car out of the Northwest, and coal production

began to decrease to such an extent that toward the close of the year many mines were operating at 50 per cent. capacity. To put the finishing touch to ups and downs the Government regulation of coal prices came along and administered the knockout punch—almost. Coal, once a pauper, then a king, with all paying homage, is once again at the bottom of the heap, with the consumer, the Government officials and the railroads occasionally delivering a healthy wallop for good measure.

Harassed by all, its profits negligible, it continues to do its "damndest" to get busy, for the operators realize that coal is the one product upon which practically every industry in the Northwest depends and upon these depend, in no small measure, the ships, the food, the clothing, the steel and the supplies the Government needs to prosecute the war.

Operators in a State of Quandary

While the coal operator in the Northwest is being stood on his head until he does not know whether he is running a coal mine as a business proposition or as a charitable institution, he continues to do his bit, the while asking only that he be not legislated out of business entirely for he can see that with a cessation of hostilities in Europe there will be an unprecedented expansion in the coal industry in the Northwest. The enormous expansion of industry will continue to draw upon the coal mines for power during years to come and the coal business will again be back upon the plane from which it has been denied for many years.

While the foregoing is a general resumé there are matters which transpired during the year which deserve special mention such as the adoption of a new mining code in the State of Washington.

As a result of an understanding between representatives of District 10 United Mine Workers of America and the associated coal operators of the state the legislature adopted a new mining code which became effective during the year. It provided sweeping reforms in the coal-mining laws and its adoption marked the achievement of an end to which many years of effort had been devoted.

Previous attempts to secure the adoption of a mining code had been defeated because the mine workers sought to add to it provisions for an 8-hour day "from bank to bank" and a 2,000-lb. ton as a basis of payment. At the last session the Coal Operators Association interposed no opposition to the various mine-safety provisions for the exclusion of the eight-hour provision. This secured its speedy passage. While it has not been in effect long enough to give a report on its success it may be said that it has proved satisfactory so far though the expense to the operators has been enormous.

Evidence of a coal shortage in the Northwest began to manifest itself as early as last April and a more acute shortage was indicated in Oregon, Washington, Idaho and Montana than in any previous year. Dealers in Oregon were forced to turn to Utah mines for adequate supply but owing to the fact that Australia had ceased to ship to California that state began to take 85 per cent. of its needs from Utah instead of 15; higher prices prevailed in California and Oregon consequently suffered.

Washington mines which had produced 2,400,000 tons of coal in 1915 and 3,038,000 in 1916 bid fair to pass the 4,000,000-ton mark with demands approximating 8,000,000 tons, and where before Utah and Wyoming mines as well as those in Montana had been able to supply the Idaho, Montana and eastern Washington markets, shipments from the first two states to California and to points east of Salt Lake City resulted in Idaho and eastern Washington looking to western Washington for their supply. In the third week in November 4,000 tons of Washington coal were shipped out of the state, 73 cars during that week were shipped to Oregon, 10 to Idaho, 4 to California and one to British Columbia.

The state fuel administrator in Idaho estimated that 680,000 tons of coal were shipped into that state from the Utah and Wyoming mines between May 1916 and May 1917 and during the first five months of 1917, 338,000 tons, but shipments were greatly reduced during the next five months. In November 1916 Idaho received 50,800 tons of coal from Utah and Wyoming but in last November this had fallen to 9,400 tons, as a result of California's demands on these mines. In other words, the year's demand in Idaho increased from a little more than 700,000 tons to 850,000 tons with less than 600,000 tons being shipped in 1917 to meet the larger figure of demand. It is likewise estimated that the demands next year will be increased 30 per cent.

Winter needs of eastern Washington, which are between 90,000 and 110,000 tons, are usually met by the Utah and Wyoming mines, but owing to the discontinuance of shipments from that district the demand will have to be met by Montana and western Washington mines.

While the 1917 production of British Columbia coals will equal if not exceed the production of 1916, the demands were greater by 40 per cent. last year. The production for the first ten months of last year follows: January, 197,636 tons; February, 212,050; March, 244,145; April, 167,033; May, 155,617; June, 150,870; July, 192,610; August, 218,037; September, 195,487; October, 230,996, a total for 10 months of 1,962,481 tons as compared with 2,026,672 tons for all of 1916 and 1,611,130 tons for all of 1915. Production for 1917 is considered remarkable in view of the fact that the coal mines in the Crow's Nest district were tied up wholly or in part during April, May and June.

Union Pacific Withdraws from Market

During the early summer the Union Pacific Railway Co. withdrew from the commercial market, stating that it would use for its own engines practically all the output of the Rock Springs district of Wyoming. This threw a greater burden upon the Montana mines whose output has been estimated as being almost 800,000 tons above the output of 1916. In April the Oregon Short Line refused to supply the Denver & Rio Grande Ry. with its cars, and while action was taken to compel their release nothing definite was done and the car shortage became acute. Without cars the mines of Montana toward the latter part of the year had to curtail production, some as much as 50 per cent. The Rock Springs district of Wyoming during the month of October operated to but 30 per cent. of capacity. It is variously estimated that had the car supply been adequate the mines of Montana would have produced

over 1,000,000 more tons last year than the year previous.

Although coal was selling for $2.40 a ton at the Utah mines in May an offer of $3.50 a ton for 10,000 tons to supply western Idaho was refused because of the lack of cars. Prices in Boise at that time were $9.70 a ton for lump coal and $5.75 per ton for screened slack delivered.

Prices in Washington at the mine in May were: Carbonado steam stoker, $3.25; Mendota mine-run, $2.88; South Prairie mine-run, $4.85, steam, $4.75; Wellington steam, $3.03; Roslyn pea, $3, mine-run, $5; Renton mine-run, $4.70.

Government officials in Oregon in June placed orders for Washington coal at the following mine prices: Black Diamond steam, $3.50; Carbonado steam, $3.50 per ton.

Estimates made in that month gave the 1917 value of coal to be used in Washington as $8,000,000 as compared with $5,000,000 in 1916 and as a result of demand all dealers went on a cash basis June 1 and the railroads announced that coal for retail would not be forwarded after Aug. 1, which immediately resulted in another upward boost to price. An order for Nanaimo Wellington lump was placed at $6.25 and one for Carbonado lump at $6.65 per ton at Everett, Wash.

Prices in Seattle at the time which did not include delivery charges of from 75c. to $1 were as follows: Newcastle mine-run, $5.50; Renton steam, $4.10; Renton lump, $6; Wingate steam, $4.90, lump, $7.75; Grand Ridge, mine-run, $4.25, lump, $5.40; Black Diamond steam, $4; South Prairie, $4.50. Prices the year before in June were: Renton steam, $3.85, lump, $5.50; Newcastle mine-run, $5; Wingate steam, $4 and lump, $5.55.

Prices in Idaho rose 60c. a ton between May 1 and June 1, and on the last-mentioned date dealers announced a further advance of 50c. a ton, effective July 1. The cheaper grades of coal on June 1 were selling at from $5.50 to $8 a ton as compared with $4.50 and $6 the same month in 1916. On July 1 prices went to $6, $8.50 and $8.75 a ton.

Dealers Refuse to Make Long-Time Contracts

Coal in Seattle advanced 50c. a ton on July 1. Portland dealers quoted the city departments the following prices on that date: Tono lump, $7 per ton; Carbon Hill fire engine coal, $12; Carbon Hill steam, $8. At the same time the year before prices on the above were from 50c. to $1.50 less. On this date coal dealers throughout Oregon announced that thereafter no orders would be taken for any coal on specified amounts or delivery nor would the price be guaranteed for more than 10 days.

During July the price of coal in British Columbia advanced $1 a ton, the second advance of that sum since May 1. Lump coal sold at $9 and nut at $8 a ton.

On Aug. 1 steaming coal advanced $1 a ton in Seattle at the bunker tips, going from $4.50 to $5.50 a ton as compared with $3.50 at the end of the winter of 1916.

On Sept. 22 C. S. Magrath, fuel controller for the Dominion of Canada, fixed coal prices at Vancouver as follows: Screened, delivery in sacks, $8.50 a ton; screened at wharf, $7.50, delivery in bulk, wagonside, $8; at wharf in bulk, $7 a ton. Lump prices were the same.

Reports during July and August in the Northwest of the proposed fixing of coal prices discouraged the purchasing of coal until some definite announcement was made by the Government, the impression being general that prices would be much lower with the result that at a season of the year when consumers were usually laying in their winter's supply of fuel little if any coal found its way into the consumers' bins. The panic communicated itself to the dealers who refused to store in the face of possible lower prices with the further result that less coal was on hand in the Northwest during July, August and September than in any other like period in its history.

Fixed Prices Cause a Wild Scramble

With the announcement of coal prices as fixed by the Federal Government a wild scramble resulted but few orders were filled because of lack of supply. Some orders then placed were only being cleared up in December. Mines in the meantime had curtailed production because of the lack of demand and at a time when hundreds of railroad cars could have been made available few were used. But in August when cars were unavailable for coal, as they were then carrying perishables, the demand for coal suddenly mounted as the result of price fixing. The operators were then unable to secure enough cars to meet the demand.

To further complicate matters the Government indicated its intention of further changing the price scale and as the public was ready to believe the revision would be downward it again withheld its orders at a time when it might have been supplied without undue trouble. Instead of prices being lowered they were raised. The original prices for Washington of $3.25 for mine-run, $3.50 for prepared sizes and $3.20 for slack or screenings were increased to $3.70, $3.95 and $3.45 respectively, with prices in King and Pierce Counties of $4.15, $4.40 and $3.75. Montana prices were increased from $2.70, $2.95 and $2.45 to $3.15, $3.40 and $2.90. Still later prepared sizes advanced to $4.05, a price higher than had ever prevailed in the state before.

The Government disregarded entirely the difference in prices that has been attached to the various grades of coal. While fixing the price at the mines for run-of-mine, the premium commercially placed on lump, egg and other prepared sizes was reduced. Simultaneously, the price chargeable by the mines for slack and screenings which formerly was almost nominal was radically increased under the Government rates. The theory no doubt was that the householder would be given the benefit of increased charges to industrial plants and establishments which have used the lower grades of coal at nominal prices. The mines unable to get the higher price with consumers demanding prepared sizes, which were but little more in price, practically discontinued shipping anything but run-of-mine. In consequence the fuel user is getting a much inferior grade of coal than formerly and is paying a high-quality price. The Government price fixing on coal is not a popular subject with the Northwestern man who pays the bills this winter.

Following the Government price setting local com-

mittees throughout the Northwest set the retail prices for the various cities based on the price of coal at the mine, plus transportation charges with a margin of profit no greater than obtained in July and in no case to exceed 30 per cent.

The final adjustment of coal prices in the Northwest resulted as follows in Seattle, the prices quoted being delivered to the nearest district from the bunkers. The top price is that set for the district difficult of access and prices for other districts ranged between:

Black Diamond lump, furnace mixture, $7.68@8.75; Carbonado lump, $8.75@10.25; furnace, $7.70@8.70; Gale Creek lump, $7.45@8.50; Grand Ridge lump, $7.55@8.35; Issaquah lump, $7.55@8.65; pea and screenings, $5.70@6.60; Renton lump, $7.55@8.75, pea and screenings, $5.70@6.65; Roslyn lump, $7.30@8.45; South Prairie lump, $7.50@8.50. The above do not include stowage.

Owing to the great demand for coal during the year and before Government regulation of prices more development of existing mines was undertaken and more new properties were started in the Northwest than probably in any other year in the past 15. Particularly is this true in Washington. Some of this work may be briefly noted as follows: The Washington Portland Cement Co. purchased the Cokedale mine in Skagit County and started development work the latter part of the year. It will use the output in the operation of its large mill at Concrete. The Wenatchee Orchards Land Co. has started the development of a recently discovered coal bed at Moses Coulee. The Pacific Coast Coal Co. of Seattle is reopening the Issaquah mine at Issaquah, Wash. Denny & Denny of Ellensburg, Wash., leased the Tanum coal property near that city and have started a crew reopening the workings which have been idle for several years. Development work has been started by L. R. Abraham T. Jones and John Waugh on a coal property on the White River near Auburn, Wash. The Washington Collieries Co., owned by Frank Waterhouse & Co. of Seattle, has started the development of a newly discovered property near Newcastle said to contain 12,000,000 tons of high-grade coal.

The Anaconda Copper Mining Co. is opening a new coal mine at Tracy, Mont., and will have 100 men at work by Feb. 1. A Great Northern Railway Co. subsidiary, the Cottonwood Coal Co., is doubling the output of its mines at Lehigh, Mont., which are expected to be producing 3500 tons daily by the end of January. New electrical machinery is being installed at the mines of the Merkle Coal Co. at Belt, Mont., which will increase the output from 400 to 1000 tons a day. Robert Smirl has started to open a coal field near Roundup, Mont., and is already selling coal to the farmers in the neighborhood for $3.50 a ton.

The projects noted have all been undertaken within the past four months.

Anthracite in New England in 1917

By G. G. WOLKINS

Boston, Mass.

SYNOPSIS — *Slow and inadequate deliveries, especially by water. Shippers of "independent" coal gradually reduced their tonnage for this market. Many barges diverted into other trade. Some sections well served all-rail. Federal regulation. Increased costs.*

DURING the whole of 1917 shipments of anthracite were slow and in most parts of New England inadequate. The trade no longer had the benefit of the large storage pile that had saved the country from extreme shortage in 1916. It was a case of depending upon the distributors to give this territory a fair quota of the output from day to day. A series of price advances, the considerate attitude of the Government toward anthracite, and the increasing difficulty of getting water shipments were the chief developments.

In general, all-rail deliveries were far better than those by water. On the Boston & Maine R.R. most retailers received 100 per cent. of their average tonnage for 1914-16. The New England railroads handled a considerable tonnage that moved to dealers who had normally depended upon delivery by water. Domestic sizes were railed as far as eastern Maine to make good the deficit, but it was soon found that cars could be more serviceably employed on shorter hauls. One of the largest shippers was able to deliver by water only about 70 per cent. of what had been its normal allotment for New England, although rail shipments from the same source were larger than ever before.

Shipments were exasperatingly slow. The prudent part of the public was so well aware of this that hoarding was typical the first six months. Early in the year broken and pea were the sizes in shortest supply, but by fall it was a question of getting anything. Deliveries from the regular companies on the "circular" basis were entirely inadequate and retailers were obliged to pay the premiums asked for what "independent" coal was available. Water freights were so high that most of the inquiry for individual output was for rail delivery. The volume of other traffic increased so heavily during February and March that anthracite dribbled through in discouraging fashion. At Tidewater, for the same reason, barges were detained at loading ports a week at a time and the assortment of domestic sizes was irregular and unsatisfactory.

New England suffered, too, through enormous demands of the Government and of cities like Philadelphia and New York, and frequently coal intended for this territory was diverted. The Tidewater dealers here leaned so heavily upon water delivery from Philadelphia that interruptions were most disappointing. The cold spell in February was the worst since 1904, eight inches of ice forming on Boston Harbor. It was apparent there would be no chance for dealers to accumulate stocks, at least until mild weather, and probably not then. By April the outlook was poor for anything like normal requirements by water, and there began a wide-

spread scramble to get rail coal. With conditions as they were, it was hard to see how the deficiency could be made up and all sorts of expedients were resorted to in the effort to get supply in any volume. Small tonnages of "independent" were offered. The dull spot near the end of March quickly disappeared, and the "ultimate consumer" tried hard to get his dealer to bind himself on season supply.

During the spring individual operators were selling at the full winter circular on prepared sizes, and the way prices were tending it was felt certain the Government would step in. There were brokers making 50c. per ton on large consignments that involved practically no risk. Egg coal was getting short because of large shipments to gas companies and iron foundries, not to speak of certain railroads, all of whom were using it in place of broken. A large tonnage of hard coal was also diverted for purposes where bituminous would normally be used. Retailers would only accept orders for delivery if and when the coal could be had and at the price current at time of delivery.

The accident to the Mahanoy plane curtailing Reading shipments to Tide and the commandeering of three Reading tugs were heavy blows to this market. Receipts decreased rapidly. All-rail cars were not to be had in quantities required, and the railroads would have been powerless had the cars been forthcoming. Most of the serious aspects were in evidence early in the season. The conservative part of the public was alarmed. By May there were only four companies delivering in barges with any regularity. Through embargoes a large part of northern New England was unable to get domestic sizes. The price of anthracite screenings at retail advanced in Boston from $4 to $6 per net ton, and "independent" stove sold at $7 gross, f.o.b. mines. There was also an advance in Reading barge rates from 75c. to 85c. from Philadelphia—the first advance in more than 20 years.

A large number of dealers in Maine were down to bare boards. Those whose usual sources of supply had withdrawn found it difficult to get cargoes forward. "Independent" shippers preferred to accumulate for small boats in New York harbor rather than try to accomplish shipment in larger bottoms; movement to Tide was erratic. By June 1 several of the "independent" factors that had been active were scarcely heard from, this being largely due to the attitude of the Federal Trade Commission.

The dealers hardest hit were those whose usual shippers had disposed largely, if not altogether, of the barges through which they were in position to name competitive prices. So much coal from these sources had been withdrawn, and the dealer had so little standing with the companies that still continued to ship, that he had been obliged to buy speculative coal to keep in business. Now even this source was failing.

During the rest of the year the situation got progressively worse. A certain percentage was maintained by the larger shippers until October, when there was a marked falling off, both rail and water. December was the lightest month of all.

The strong arm of the Government was evident early in the year through the broad authority granted the Federal Trade Commission. Prices and distribution of anthracite were closely scrutinized through weekly reports, and some pointed questions were asked. The investigation with retail costs was particularly thorough, although mistakes were made in abundance. It was well known, for instance, that the reserves of the larger companies were all that prevented famine a year ago, yet the commission stopped at a comparison of actual mining, drawing inferences therefrom that coal supply would be ample. There were various local flurries over reports as to retail prices, and these paved the way for the appointment of fuel committees under the Lever Act. By the end of the year retail prices had been established officially in most of the cities.

The New England Coal Committee did good service in facilitating rail deliveries during the summer through the so-called "solid train" movement. The aggregate tonnage was not large, but it helped the all-rail territory.

April prices of the Philadelphia & Reading Coal and Iron Co. were 50c. less than the Nov. 1, 1916, circular, but quotations were not so comprehensive as in other years. Broken and pea prices were not announced at that time. The other companies did not follow so closely as in other years. Notice was given that sales were thereafter to be f.o.b. barge at loading port, delivery being at risk of consignee. The wage advance in April foreshadowed a material advance May 1, followed by the usual monthly scaling up month by month to Sept. 1, when the Government-prescribed schedule went into effect. This latter was increased Dec. 1, when a 35c. wage increase was granted. Beginning Sept. 1, operators other than the larger companies named in the order, were allowed to charge 75c. more on domestic sizes.

APPROXIMATE COST OF READING COAL ALONGSIDE BOSTON DURING 1917

White Ash	Jan. 1, 1917	Apr. 1, 1917	May 1, 1917	Sept. 1, 1917	Dec. 1, 1917
Broken	$5.60	$6.13	$6.63	$6.93	$7.61
Egg	6.10	5.63	6.23	6.83	7.51
Stove	6.35	5.88	6.48	7.08	7.76
Chestnut	6.40	5.93	6.53	7.18	7.86
Pea	3.85	4.23	4.73	6.18	6.86

New rules governing demurrage went into effect on Reading barges Nov. 1. On cargo capacity of 1500 tons or less but two days were allowed for discharging, demurrage being 7c. per ton per day, no premium allowed.

Reading barge rates again advanced Nov. 2 from $1 to $1.25 on anthracite to Boston points, and Nov. 1 a war tax went into effect, amounting to more than 7½c. per ton.

Pittsburgh District in 1917

By B. E. V. Luty

Pittsburgh, Penn.

As the Pittsburgh district produces a considerable proportion of the country's total coal output, it is not altogether easy, in a review of the district, to cover the developments that were strictly local in character and exclude those that were of national importance. Indeed, there is no generally accepted definition of what is included in the Pittsburgh district. There are two concrete conceptions as to "Pittsburgh coal." One is coal mined from the Pittsburgh seam, the other is coal originating within the Pittsburgh freight district. One is a genealogical, the other a railroad definition, but in common parlance the term "Pittsburgh" takes on a broader and a much vaguer interpretation. The Geological Survey does not attempt to differentiate. It calmly adopts, when referring to the bituminous coal

production of Pennsylvania, the convenient geographical lines, and gives the state's production by counties.

At the beginning of the year operators were considering the naming of a "circular price" for contracts for the twelvemonth beginning Apr. 1 and were disposed to settle upon $2.75. This price did not seem attractive to buyers, considering that it was about double the normal price and deliveries would not end until a date nearly 15 months distant. Operators were not encouraged to name a price and as time passed and the railroad congestion continued they became less disposed to seek buyers at all, feeling that perhaps the spot market would afford them larger profits and would certainly relieve them of worries, transportation conditions being such that no operator would be safe in selling anything like his entire output.

It can hardly be said that any regular circular price was set at all. Some old contracts were renewed at $2.75, but not as open market transactions, the operators picking those customers who had been the most indulgent with them in the latter part of 1916, when it was impossible to fill contract requirements in full. Other contracts were made at $3 and higher prices as Apr. 1 was approached, the spot market generally ranging from $4 to $5, while toward midsummer it was $5 and higher. When Apr. 1 arrived contracting, as a regular market operation, practically stopped, and such contracts as were made thereafter represented special cases, where buyer and seller chanced to be able to get together. There was considerable contracting after the so-called "Peabody agreement" in June, operators claiming it was no agreement as the Secretary of War and the Secretary of the Navy both repudiated it, and these contracts remained in force after the Fuel Administration set prices.

On Aug. 22 the Fuel Administration fixed prices, the Pittsburgh district price being $2, per net ton at mine, for mine-run, with 25c. less for slack and 25c. more for screened. The revision of prices made in connection with the general wage advance carried all these prices 45c. higher.

Lake Coal Contracts Went Begging

A particularly difficult matter was that of contracts for Lake coal. Operators did not want them, as they foresaw that by far the strongest coal market would fall during the Lake shipping season, and the Lake interests in many cases had to content themselves with contracts for fixed tonnages, settlement to be made against the spot market from week to week, whatever it might be.

One of the causes of the continued high price of coal was the fact that the buyers, in the case of Pittsburgh district coal, were largely steel interests which were making fabulous profits and had to operate, no matter what the coal cost, and in their buying operations they made no effort to conceal the fact that they would pay any price necessary for fuel. Much of their coal they bought through brokers, whose margin was likely to be larger the higher the price. Usually the instructions to brokers were to secure a certain number of carloads on a certain day. To the broker thus instructed there was no tomorrow, and prices had no opportunity to recede. Occasionally the steel mills would stay out of the market a few days, but only long enough for their needs to accumulate, not long enough for coal to accumulate. Operators and brokers had sufficient courage—it did not require a great deal—to hold coal for a few days, and the railroads seemed to be content with the demurrage they received. The condition presented was certainly such as to invite Government interference.

Various opinions may be held as to the Lake trade. For many years Pittsburgh operators had claimed the railroads discriminated against them, by charging them rates that figured out much more, per ton-mile, than were accorded West Virginia and southern Ohio operators, but these rates had been equalized, and one of the complaints of the Pittsburgh operators in 1917 was that they were given altogether too much of the Lake trade. The interests of the Northwest and the Lake vessel interests early reached an understanding, whereby they went to Washington and secured a priority order in favor of the movement of Lake coal on the railroads. When the West Virginia operators were unable to ship as much Lake coal as they had contracted to ship, the Pittsburgh district was called upon for more. The railroads carried out the priority order in favor of Lake coal quite fully, but coal operators charged that they found means to do so because the long haul was particularly profitable, as compared to the haul to Youngstown and other important points of line consumption.

The Pittsburgh district, quite irrespective of what Connellsville did, shipped a great deal of coal in 1917 for byproduct coking. Only a few years ago Pittsburgh coal was not supposed to count in the matter of byproduct coking, but the byproduct industry has advanced and while it does not even now know nearly as much about coal as it should, it knows much more than formerly, and Pittsburgh coal is being used more and more for byproduct coking. It is a relatively new thing to consider coal marketwise in connection with coking. Before the byproduct oven practically all the coke coked was mined at the site of the ovens, and the common conception was that the district produced coke, not coal.

One of the stimuli to the erection of byproduct ovens was the fact that since the ovens were naturally built at the blast furnaces, in order that the surplus gas might be used, and for other reasons, it was unnecessary to carry large reserves of coal land, and thus while the byproduct ovens cost much more than beehive ovens, there was a saving in capital investment because the ovens did not need to be built on extensive coal holdings. The byproduct ovens buy coal where they like, and can experiment. Some have made three-year and five-year contracts for coal, while others have preferred to buy for shorter periods. Several millions of tons a year of Pittsburgh coal is now going into byproduct ovens under various sales contracts.

More Review Articles Next Week

Every effort was made this year to get all of the general reviews in this special number of *Coal Age*. Notwithstanding that additional pages were added, it has been impossible to accomplish this aim. Our next issue will contain a number of the most interesting reviews that were prepared for us. Most of these articles that were necessarily held over cover the mechanical and operating end of the industry for the past year. One such article reviews developments in the anthracite industry and was prepared by H. M. Crankshaw, mine manager, Hazleton, Penn. Another article covering anthracite was prepared by John Haertter, division superintendent of the Lehigh Valley Coal Co. An extremely interesting résumé of Western coal mining has been written by A. C. Watts, chief engineer of the Utah Fuel Co. Other reviews will cover St. Louis coal trade, market conditions in New England, etc. Be sure and bind up the next issue of *Coal Age* with this one, and you will have the full story of coal mining in 1917.

Southern Illinois in 1917

By E. J. WALLACE
St. Louis, Missouri

SYNOPSIS—*In spite of many uncertainties and labor troubles the year was a prosperous one. Many of the labor troubles and petty strikes and walkouts were found to have been of enemy origin and toward the latter part of the season the I. W. W.'s became unpopular even in districts containing many Teutonic aliens.*

INASMUCH as it is impossible to forecast the future, it is not a positive statement to put 1917 down as the greatest coal year on record in the Illinois field, but it is likely that its equal will never be.

It was a successful year, not as successful as some operators had expected, but it out-distanced all previous years as a money-maker for everyone in the operating end. It was a most uncertain kind of future that the trade looked forward to at the beginning. Record prices then prevailed—$4 to $4.50 for screened sizes in a general way. These prices had all winter been a thorn in the side of the miner. He didn't participate, and that is not according to the law that the socialistic leaders preached. There was unrest, and to the lay opinion, there was some justice in this. The operators pursued in many instances a policy of "gouge" and the miner learning of it adopted the system as his own. This began to assume concrete shape in February and March in the talk of more money.

The demand for coal was so strenuous that even in periods of mild weather there was no letup. It was a shortage of cars, minor labor disputes and many little things that in the whole made the work a problem, and while prices were high, the task was not congenial.

Operators in the southern Illinois field south of the Springfield district, which is known as the central Illinois field, began speculating in February with contracts and as time wore on they grew more optimistic until on Apr. 1 there were no contracts to speak of being discussed.

Several big operations, however, had sold their outputs before this time for the year ending Apr. 1, 1918, on a mine-run basis to railroads for engine fuel. These prices were about $1.75 for mine-run, cars furnished by the buyer.

On Apr. 1 came the demand for a further increase and the demand to annul the wage agreement which was good for another year. About the middle of the month the men got about a 20 per cent. increase to machine miners and 13 per cent. to pick miners. This did not increase production; there was congestion on the railroads and embargoes tied up traffic.

Reports that the French and Italian governments were after millions of tons of Illinois coal set the field aflame with anticipation of one glorious reign of unbridled and unlimited prices. Owing to strikes in fields west of the river there was always the incentive to reach out for business in these sections that the railroads refused to furnish equipment for.

There were no serious accidents in the first quarter in the southern Illinois field. The few minor affairs here and there helped in a measure to keep down the figures that loomed up as a record breaker for the year.

Only one fully equipped mine in the Williamson-Franklin County field (hereinafter called Carterville) remained idle and it was being put in shape for work. This was the Keystone mine at Pittsburgh. Strip and slope mines along the outcrop of the No. 6 seam all the way from Belleville south to Marion blossomed forth to add their mite, and all secured good prices.

The old C. & C. mine at DeSoto was taken over and work started on it. Several changes of ownership came about in the various districts south from Springfield. This was especially so in the Standard field adjacent to East St. Louis on the east and south. These old, small shafts began to get under the control of operators who took over several of them and their output sold to northern railroads. Every old shaft available was opened up, and the same thing pertains to the DuQuoin field south of the Standard district and north and west of the Carterville field. Options were taken here on several thousands of acres and strip mine operations prepared for. Later the Union Colliery Co. of St. Louis took over a large tract at the new town of Dowell and is now sinking a large mine.

New Developments in Many Counties

In Williamson County a few old abandoned shafts were prospected and plans made to bring them in. Franklin County was with one exception going full. This exception later opened up. There were many shutdowns in April and May for repairs and in some cases a rebuilt plant.

In Franklin County the Old Ben Corporation bought the four big mines at Christopher, giving this firm six mines producing about 25,000 tons daily.

The Harrisburg field in Saline County came forward with new mines and an increased tonnage. This is the only southern Illinois field that ships no coal to the St. Louis market. Its output moves up through western Indiana to Chicago and the Northwest. There was more activity in this field than in all of the others combined.

The matter of mine supplies was a serious one. There were delays of many months in securing equipment to fit up mines for the increased tonnage. Railroad coal was the order in the spring months for almost the entire southern end of the state. It is still a mystery at the end of the year as to where all of this railroad coal went.

With the opening of many mines there came an acute shortage of miners and mine help, and this has continued. Toward the last of the first half of the year the car supply became serious, but for the first time since last fall the operators except in the Standard field began to see the light of day over their order files. There was as a result of this a break in the market, but not for long.

An attempt was made by the U. M. W. of A. to have a bill passed by the Illinois legislature to prevent courts from granting injunctions in labor disputes. There still continued minor strikes here and there, and the miners began murmuring that the increase granted them was not sufficient in view of what the operator received. There was at the close of June a letup in the demand. This had been noticeable since May in domestic sizes.

The U. S. Government had in some manner promised the public lower coal prices, and inasmuch as coal was going up all of the time the papers got to kicking in, with the result that the Government intervened and the so-called "Peabody" prices went into effect. These had a tendency to stiffen up the market and it became as active as possible, considering that everything was against it.

July 1 saw Standard coal hanging on the ragged edge of production cost again.

Labor Troubles Were Numerous

There seemed to be a tendency to seek cause for strikes on the part of the miners throughout the midsummer. In Montgomery County they went out in an attempt to unionize a glass factory that used their coal. When ordered back and fined, they struck because the fine was deducted.

In the Springfield district labor troubles of this character were in the making and later came to a head in the street railway strike, when all of the miners went out. This attitude on the part of the miners, and contrary to the orders of their officers, was prevalent in a general way in the entire field.

Labor trouble in the mines of Montgomery County and in the Mt. Olive and Standard fields was evidenced by petty grievances. These were later traced to the activities of pro-German miners and others influenced by them. The I. W. W. movement was found to be getting a footing all the way from Springfield down to Franklin County. This was opposed at many places where socialism had a good start, and it was folly in a short time for an I. W. W. to show up in a mining town unless the workers were of German extraction. Even then it was not popular.

In the 5th and 9th districts, the Standard field, too much prosperity to many of the miners began to assume a serious aspect, and at a joint meeting of the operators and union officials the latter agreed to do everything possible to keep the miners at work. At Nokomis, the miners quit because of the unsafe condition of the North mine there. State inspectors verified this contention.

On July 1 the compulsory compensation act went into effect. The efforts of organized labor for years were directed toward this. Illinois is the second coal mining state and the fourth state in the Union to pass such a law. The Illinois U. M. W. of A. maintain a legal department where all compensation cases are handled free of charge.

These legal bureaus are maintained in all mining districts and about once a month the miners receive lecture instructions on the compensation and other laws relative to miners and their rights. This is the first and as far as is known the only labor organization in the world providing such service.

August saw much unrest in the Springfield and Standard districts. As a rule the employee does not know the market on coal. The uncertain prices of slack when lump is high usually makes it difficult for him to figure whether the operator is losing or making money. With the price of coal known, and higher than ever before at that time, the miners got the idea that there was some logic in the socialistic talk they heard. They felt underpaid; they wanted to participate in the general prosperity that they figured their labor helped to produce, and inasmuch as it was evident that there was no patriotic spirit in the manner that some operators played the market, they saw no reason why they should not get into the "self-centered" game too.

The mule drivers were the most aggressive and started a small strike in the Springfield and Mt. Olive districts that spread in a few days to nearly the entire field. The manager of a mine at Virden presumably gave the drivers nine hours' pay for eight hours' work. When other mines refused this, they all went down. Almost 60 mines were idle and over 100,000 tons per day was lost.

The officials tried to get the men back, but they went back when they got tired of loafing or at the insistence of their fellow workers. This was forced by President Farrington threatening to expel from the union all who failed to go to work. He notified the Coal Production Committee of the Council of National Defense and charged that the Illinois Council was to blame by claiming that the operators were making enormous profits, thus inciting the men. The operators stood firm against any concessions. It developed that President Farrington had been negotiating for a new day-wage scale when this trouble broke out. Settlement of this was delayed by the strike.

President Puts Stop to Speculating

President Wilson's proclamation of Aug. 21 broke up the tea party of high prices and also many other things. It put a stop to speculating in old and abandoned mines and brought the coal industry down to business with a jar that is still felt. It was a hard affair for many to get over, but in nearly every instance it was agreed as the beginning of a method that was right in war times. The jobber was hit hardest. Many mine agents who held verbal contracts were shut off and conditions were chaotic for a few days.

Sept. 1 saw peace in all of the fields. The movement for a new scale was well under way and the operators felt that this was in many respects just. Many of the younger men in the mines had previously left for factory employment, making munitions, where the pay was much better on account of steady work.

President Farrington of the Illinois U. M. W. of A. kept his men in line and proved one of the best aids that the Federal Government had in securing maximum tonnage, under trying conditions. Many locals had figured on a walk-out Sept. 1 for more money, but decided to wait. The miners at the old Hart-Williams mine at Benton refused to permit its reopening unless their future pays were insured by the Taylor Coal Co. They had lost through the failure over a year before of the Hart-Williams Company.

Attorney General Brundage appeased Governor Lowden by contending that the State of Illinois had the power to seize coal properties and operate them.

Governor Lowden complained that the new prices of Aug. 21 were not low enough. This caused a feeling of uneasiness in many places, both among miners and mine owners.

About the middle of the month while President Farrington was in Washington in an endeavor to get the Government approval for an increase the "I Won't Work" element in the Springfield district broke away and went out "until they got an advance." This displeased the authorities at Washington and put Farrington in a most embarrassing position. The Springfield affair was a continuation of the labor troubles in that city in other lines for many months. The union planned a big Sunday parade and when the authorities ordered police and militia to prevent it on account of the danger of riot, the miners became incensed over the "denial" of "their constitutional rights and free speech." They lost $18,000 per day while they stayed out and the public lost 25,000 tons of coal each day.

Farrington came back and ordered this irresponsible rabble back to work, contending that 4000 to 5000 miners in the ill-famed labor-ridden Springfield district should not override the rules made by 80,000 other members of the union in the state.

There were other strikes of various kinds for all kinds of causes throughout the field, and these seemed to spring up as fast as they were settled or overruled.

The acts of the miners in several places bordered on open disloyalty. At Nokomis, a miner who defamed the Government and talked against the continued production of coal was arrested. A deputy sheriff who assisted in the arrest was a member of the union. The 600 men went out until he was discharged. He stayed away from work so as to keep the miners working. There was a general "laying down" by the miners. A nice, quiet way of keeping down tonnage by staying at home, that kept the honest miner idle and meant a loss to everybody concerned.

New Scale Causes Strikes in Standard Field

The new wage agreement settled the matter except in the northern Illinois field where general dissatisfaction prevailed over the new scale. Up until now this had been the peaceable field. There were strikes over the new scale in the Standard field because it didn't go into effect when announced on Oct. 16, and in a few days the entire state almost was out without the authority of the union officials. This was the flagrant violation of all of their agreements and President Farrington was again forced to threaten expulsion to bring the men back to work. This lasted over a week and proved a serious handicap to the public. Any further delay in resuming work would have meant a coal famine to St. Louis and many other near-by cities.

It was evident through the recent strike that a well-trained group of agitators was at work. This became apparent after the new scale went into effect, when it became known that there was dissatisfaction over the penalty clause.

November was the most peace-loving month of the many that had passed. Only a few small occurrences disturbed conditions and then not seriously.

December found peace prevailing. There were a few arrests for the I. W. W. activities of the past few months and the Springfield local acknowledged the unworthiness of some of its members and backed up the union officials. Thus the year to the Illinois operator was one of labor troubles.

The few abandoned shafts that were not working at the dawn of 1917 were taken over during the year and fixed up at least temporarily. A few local mines were opened in Williamson County. Saline County was the greatest boom in new shafts, and Franklin County got a couple. The DuQuoin field "came back." There is a big mine going in at Dowell, a new mining town near-by, and much activity over some prospective shafts as well as strip mines. In the Mt. Olive field at the new town of Wilson, what will be one of the largest mines in existence will soon be complete.

There were no real serious accidents until the latter part of the year. A few small explosions resulted in the loss of one or two lives each.

The Christopher mines are dry. Dust and gas is the danger there and in November came the first mishap, with 18 lives lost. Shortly afterward the Zeigler mine at Zeigler suffered a series of explosions with the loss of three or four men.

Top works destroyed by fire were numerous throughout the state, and many of these fires were of suspicious origin.

Birmingham Coke Market, 1917

By H. B. McLaurine
Birmingham, Ala.

Coke producers in the Birmingham district during 1917 had the best year in their history. The market having attained a strong position during the latter part of 1916 and at the beginning of 1917, the demand was strong and steady. Quotations on spot foundry ranged from $10 to $11 per net ton ovens as against $3.75 and $4 during January, 1916. Furnace coke was quoted at $5 to $6 per net ton ovens in the spot market.

The anticipated production of foundry coke was practically covered by contracts, which did not expire until July 1, 1917. Almost all of these were renewed for another year for increased tonnage at prices ranging from $8 to $12.50 per net ton ovens, the price being dependent in a degree on the tonnage required and the length of time the customer had been on the books of the producer. The scarcity of this grade of coke continued throughout the year, being accentuated more and more as the demand strengthened with inquiries from every section of Southern and Western territory, and quotations gradually advanced to $14 to $16.50 per net ton ovens at the time Government figures were announced by Administrator Garfield. The regulative figures of $6 to $7 per net ton ovens did not affect market conditions materially on account of the scant supply of coke over contract requirements, and the full force and effect of Government regulation will not be felt in this market before the middle of 1918, when the majority of contracts expire.

The heavy consumption of furnace coke in the immediate district by the iron makers, who drove their plants at full capacity during the year, left little of this grade of coke available for the spot trade, quotations ranging from $6 to $8 per net ton ovens prior to the date Government schedules became effective.

The abnormal and unprecedented demand for coke

from every quarter in 1917 caused rapid enlargement in the producing facilities, and hundreds of old-style ovens which had not been operated since 1913 were repaired and placed in commission with as much dispatch as possible. Numbers of others were forced to remain idle on account of the inability to secure coal for consumption. During the latter half of the year batteries of byproduct ovens on which construction was begun in 1916, were placed in service by the Woodward Iron Co. at Woodward, Ala., and the Gulf States Steel Co. at its Gadsden plant. While these new and rehabilitated plants added a heavy additional tonnage to the normal output of the district it apparently had no relative bearing in lessening the inquiries, the needs of the trade being insistently pressed upon the attention of the producers to the end of the year.

Production was crippled to some extent by the shortage of equipment for loading, and consumers on the gulf coast and in Texas and Pacific coast territory, who depend on Alabama for practically their whole foundry coke supply, were unable to secure schedule deliveries on their contracts on account of an insufficient and irregular supply of foreign line equipment on which the movement to such territory was dependent. The output was also curtailed by labor shortage at the mines, where coal production was interfered with. Many ovens were thus lost on account of insufficient coal for regular charging.

It is estimated that the output of Alabama ovens in 1917 will closely approximate 5,000,000 net tons. Accurate figures will not be available for some weeks yet. The tonnage for 1916 was 4,385,493.

The Cincinnati Coal Trade in 1917

By KENNETH C. CRAIN
Cincinnati, Ohio

SYNOPSIS — *From the standpoint of price received the year was satisfactory to the trade; from the standpoint of supply it was unsatisfactory. The railroads hold the key to the situation and upon their ability to handle traffic depends the prosperity of the trade.*

THE current year's coal business has been characterized in Cincinnati, as elsewhere, by unprecedented conditions, calculated to make coal men remember 1917 for a long time to come. Outstanding among these conditions were the extraordinary demand for coal by manufacturers; the extremely high prices received up to the date when prices were fixed by Federal authorities; and, above all, the inability of the railroads to transport all of the coal offered. To crown the year, Cincinnati and the surrounding territory south of the coal fields of Ohio, west of the West Virginia fields, and north of the fields in eastern Kentucky, faced an actual fuel famine, for the first time in its history.

This condition, unique in its extensiveness, its severity, and the almost complete helplessness of the coal men, may well serve as a text from which to work back to conditions throughout the year, as well as to point the moral which may be drawn from the trade's experiences. This moral is, of course, the failure of the railroads to supplement the efforts of the mine operators to produce enough coal to meet the country's necessities, and the imperative necessity of seeing that it does not recur.

At the year's close measures were being taken which should have been taken months ago. These embrace the elimination of competition among carriers, and the accomplishment of pooling arrangements, designed to relieve congestion and to expedite the movement of loaded cars and the return of empties. Indications are that this plan of facilitating the movement of coal will be measurably successful, and that in 1918 the coal trade, the public and the railroads will not be forced to face such a condition as has existed during 1917.

It would require much labor to collect figures showing in detail the extent of the car supply, as compared with the capacity of the mines and full working time. Without such detailed figures, however, and from reports made from time to time through the year by various operators, especially in the several West Virginia fields, it can be said, with a fair degree of certainty, that the car supply throughout the year has averaged more than 50 per cent. of requirements; and this is said with full knowledge that the records of the railroad companies show loading figures surpassing those of former years.

In other words, the operators, in spite of Government prices lower than were desirable to stimulate production, have none the less been prepared to ship an amount of coal which would have kept every factory well supplied, and which would have given every domestic consumer all the coal required to supply warmth. That they have not been able to do so, while at the same time mining and shipping more coal than in a normal year, if not more than ever before, seems to be in no way the fault of the operators, but rather that of transportation.

It should be said, in turn, that the railroad companies have been severely handicapped by the necessity of handling record-breaking traffic of all sorts, without the opportunity, either as to finances or time, to equip themselves to meet the emergency. This is the opinion, based on generally-known conditions, advanced by local coal men and appears to be close to absolute fact.

Federal action has complicated the business of the year in more ways than one for Cincinnati. The effect of this action has perhaps been more strongly felt here than elsewhere on account of the fact that the city is the gateway through which passes the greater part of the coal destined for Lake ports. In particular, the so-called priority order by which coal destined for the Northwest was given preference both in loading and in transportation over coal for way points, has been charged by many with having operated to bring on the famine from which Cincinnati and the greater part of Ohio have suffered.

The principle of the order has not been widely controverted. It is generally agreed that it was reasonable to expedite Lake shipments while Lake traffic was open, and before severe weather drew seriously upon available supplies in the territory closer to the mines. Ohio state officials however have specifically charged that more coal than was necessary was shipped to Lake ports, and that, in the meantime, Ohio, including Cincinnati, has been prevented from obtaining even its minimum fuel requirements, with the result that widespread distress has been felt.

That this was actually the case remains a matter of controversy. The essential facts are that the Federal Fuel Administration has secured the movement to the Northwest of what is said to be an adequate amount of fuel, estimated to be 1,250,000 tons over the volume shipped last year, and that, unfortunately, early December weather in Ohio was of a severity unparalleled for 45 years. The inevitable result was a tremendous emergency demand for coal, which could not be satisfied; while the railroads, already struggling with an unmanageable congestion of traffic, wherein coal was an important factor, were confronted with the usual reduction in operating efficiency produced by heavy snow and severe cold. The net result was the coal famine referred to.

Prices High at Beginning of Year

The first half of the year will probably be long remembered for the prices received for coal, with bituminous screenings, the usual fuel of industry, bringing as high as $4.50 a ton f.o.b. mines. It was the continuous heavy industrial demand, which was never satisfied during the entire year, which drove prices to this figure, and placed screenings, for the first time, at the top of the list, above prepared grades. It will be recalled that this condition was clearly forecasted during the latter part of 1916, when the industrial call for fuel was steadily increased, and prices as steadily rose in response to this demand.

With current consumption approximating production, or, at least, the shipments forwarded, it followed that large consumers were unable to lay in any substantial reserves of fuel, and the peak of consumption, when cold weather arrived, unseasonably early in October, rapidly brought on the condition described above. At the same time, the unusually high prices prevailing led many dealers, wholesale and retail, to refrain from making commitments for future supplies, and from purchasing coal for storage during the summer months, until it was too late. This, again, was a prominent factor in bringing about famine conditions. It seemed, in fact, that everything combined to produce a situation which, although it might have been expected to result from the conditions prevailing, was rendered far more acute than it would otherwise have been by unseasonable weather and by transportation complications.

The anticipation of Federal regulation of prices was early a factor in the situation. It became evident during the summer that the Government would attempt to control prices, and this was done in August, when mine prices were announced. These prices were materially lower than those tentatively fixed at the meeting of coal operators with Secretary Lane, when he enthusiastically declared that the operators, in agreeing to prices materially lower than those prevailing in the open market, had made a patriotic sacrifice.

The public, naturally, waited to get coal at the prices thus announced. As coal men pointed out, however, the fixing of prices did not automatically produce coal, and there seems to be no doubt that many small operations found it unprofitable to do business at the Federal prices, and therefore closed down. However, in view of the inability of the railroads to handle the coal offered, and of the heavy shipments forwarded in spite of this, it cannot be said that this factor contributed materially to the general shortage of fuel.

As many large operators were fully sold up before the Federal order went into effect, they were obviously not affected by it, since this order could not invalidate existing contracts or alter prices for coal sold. On the other hand, much coal went forward, under the priority order, at prices not affected by the Government schedule. Thus while the trade did not attempt to evade the Federal figures, as to coal to which they could apply, conditions generally were such that the first season of Federal regulation was hardly a complete success. At the same time, prices would have soared to even higher levels had not some check been imposed, and the shortage would have occurred just the same, on account of transportation conditions.

Cincinnati profited, as it always does, by the fact that the Ohio River furnishes a transportation medium for coal which is independent of railroad congestion. The volume of coal moved on the river does not compare with that handled by rail, but it is none the less a decidedly useful addition to the amount received at this point. In 1917, however, unusual interest was attached to river shipments by reason of the use for the first time of the partially-completed system of Government dams as an active factor in facilitating traffic.

Make Ohio Navigable All Year Round

These dams are intended eventually to provide a river stage of not less than 9 ft. the year around from Pittsburgh to the mouth of the Mississippi. There will be no such thing as a low-water, non-navigable stage of the Ohio when the dams are finished. On the river above Cincinnati many of the dams are completed, and in 1917, for the first time, their services were called into use other than as means of providing a series of relatively deep pools. This is what is meant when it is stated that they were actively used.

The upper river dams were used on several occasions to neutralize a non-navigable stage. By carefully timing the movement of coal fleets, and releasing the water from dam to dam as required, artificial waves of several miles in length were created. On the crest of these waves good-sized coal shipments moved down the river to Cincinnati and other points, supplementing the limited supplies of coal on hand.

There were times when the river was so low that these artificial rises or waves were not possible. At the same time, they illustrated in a highly practical manner the usefulness of the Ohio River improvements and gave point to the assertions of supporters of inland waterway improvements that at least a partial solution of traffic difficulties lies in this direction.

What has been said above applies, in a general way, to the retail trade in Cincinnati as well as to wholesalers.

operators and operators' agents doing business in and around the city. The retail trade has had repeatedly the unusual experience of being entirely without coal to deliver to its customers, and of refusing orders because it could not fill them. The year's business for the retailers was entirely satisfactory as to price, as the first half of the year was without Federal or other restriction in this respect, and for some time after Federal prices were fixed, the retail trade was without coal bought at the new figures, and was therefore immune from compulsory sales at figures based on the Government mine prices. Conditions cannot be called satisfactory from a business standpoint, however, when the trade is prevented from doing business by lack of coal; and this was the position of the retail, as well as the rest of the trade, when the year closed.

Prospects for 1918 are that demand will continue on a heavy scale. It remains to be seen whether pooling and other forms of coöperation among the carriers, with Federal aid, will enable the coal trade to supply that demand. The key to the situation is now, as it has been for more than a year, the ability of the carriers to supply cars for loading, to move the loads promptly, and to return empties to the mines after delivery and discharge.

Baltimore Trade in 1917

There will probably be little regret in the coal trade here over the passing of 1917. The New Year has been entered with the fervent hope that business, under various Government regulations and restrictions, will soon work down to an equitable basis. The old year was not without its good points, but there was so much of uncertainty as to the entire situation, so much of mental and physical strain in many cases to meet Government demands or threatened acts that would have proved detrimental, that the coal men can get little pleasure from retrospection.

There were few business failures and changes were unimportant. And while the coal man had numerous slack periods because he could not get the fuel to dispense to the tremendous demand that faced him, he at other times made larger profits than ever before and the year worked down to a pretty fair earning basis, at least for the soft-coal interests. The hard-coal men, bound tighter by price regulations, had more of difficulty to overcome, but the majority managed to pull through in good shape.

The year 1917 was ushered in in unusual form for the bituminous interests, since even at that time the demand was running far ahead of the deliveries because of inadequate transportation, and prices for spot coals had mounted to $5 and $6 mine basis in many cases. Low- and high-grade coals all looked alike in this selling. Producers and middlemen held tight to high contract rates, and closings over the year between Jan. 1 and Apr. 1 mounted in many cases to $4.50, and even at these figures the consumers could not be given all they sought.

Around the first of April, while a number of usual contract makers proved price shy and decided to buy in the open market in the hope that the prices would break during the summer, there was no over-supply of offerings of contracts. Many of the consumers who remained out have since paid dearly for the move, both in high prices for spot coals before Government rates began and in enforced curtailment of work afterward by reason of inability to get fuel as desired.

The story of the trade here over-summer was about the same as with the rest of the country. The first Government request-price at the mines of $3 saw consumers rushing to coal offices demanding fuel at that figure, only to learn that the coal men, with transportation slow, were unable to cover even their contracts at much higher prices, and could not sell the new-price coal. Three-dollar coal was rather a myth in this section, as was also the $2 coal price later set by the Government. The summer and early fall, in fact, saw practically no movement outside of contract coal, or Government-priced coal, plus haulage and other charges, in order to "beat the devil about the stump" and make possible a production at the $2 mine basis. The coal men here were among the first to protest that many mines could not produce at $2 and the numerous closings in Maryland and West Virginia proved the case.

The fall and early winter proved a grand scramble to the trade. Much of the time was spent in readjusting office forces because of the military demands of the nation, and in working out numerous Government reports and schedules. Contract business continued the overpowering feature, where coal could be secured at all, although there was some little Government-priced coal, under the third price arrangement, disposed of in this territory.

Winter saw a big test of every energy, with coal men distracted, transportation interests plainly much at sea, and with Fuel Administration orders by the quarter of a peck to keep things bubbling. Throughout all the turmoil the coal men have kept the industrial works here supplied, at times with almost famine-like supplies it is true, but while there were plants that had to cut down service and lay off men, no actual closings for any length of time were recorded.

During the year the jobbers of Maryland formed an association, and they are waiting for the final Government-control plans, which may be delayed until April, to find out just what their status is to be. That these men are needed as a distributing factor has become more and more patent, and the final shakedown will probably give them official recognition.

The anthracite dealers here worked through the early months of 1917 without being able to get anything like the amount of coal they needed, and almost from the first paid considerable premiums for the fuel they desired promptly. The delay in the spring schedule of wholesalers caused June to roll around before there were any deliveries on spring orders. Meanwhile an unusual spring consumption had caused a distinct shortage and had wiped out practically all the yard reserves. Simultaneously the sales had been continued on the old winter basis, plus certain size advances at the mines.

During the summer there was a heavy receipt of hard coal here, despite the poor railroad conditions generally, and the winter might not have approached with so severe a shortage had it not been for an unusually early fall and a consequent early consumption. The receipts from Jan. 1 to Oct. 1 were about 57,000 tons in excess of 1916, but as there was an estimated additional consumption of 90,000 tons before winter set in here, the

trade found real cold weather at hand with a shortage of 37,000 tons or thereabouts, and with the receipts under the rail congestion down to about one-half of what they should be in normal times. In December the receipts dropped back to about one-third of normal, and yard supplies were so far depleted that the city faced a fuel famine. Only the most judicious work, with the retail coal exchange aiding the fuel administrators, prevented real hardship and alleviated much of the existing suffering.

With such a record, it is small wonder that the coal trade here says "Welcome 1918."

Birmingham Coal Trade in 1917

By H. B. McLAURINE
Birmingham, Ala.

CONDITIONS affecting the Alabama trade at the beginning of 1917 were most favorable, and gave promise of affording the largest volume of profitable business that the industry had enjoyed in several years. Heavy contract bookings made during the previous 12 months, on which deliveries extended over the first half of 1917, and some through the entire year (taken for the first time in quite a while at figures fairly remunerative to the operators), and undelivered tonnage on open sales, brought forward from the last quarter of 1916, during which prices reached an unusually high level, were factors which seemed to warrant an optimistic view. The shortage of equipment and labor, which had appreciably curtailed production for the past six months and held the output near a parity with the consumption, supplemented by the natural sequence of high prices, had discouraged—in fact precluded—the accumulation of any stocks in the hands of consumers. The abnormal industrial activity and heavy railroad traffic were additional factors which clearly indicated a continuous and increasing demand for fuel, which would further tax the producing and transportation facilities of the country, and maintain price stability.

The above-mentioned conditions, which augured well, materialized to a marked degree with a satisfactory period of business which extended through the first seven months of the year, and up to Aug. 21, when Government schedules carrying drastic reductions in prices at the mines were promulgated. Deficiency in equipment and labor supply were continuing factors in preventing the elimination of the disparity between production and consumption during the above period. The ever-increasing demands of industry and additional fuel requirements of the railroads above contract deliveries made inroads on the already limited free coal supply and precluded the possibility of any material recession in the prices, which never fluctuated more than 50c. one way or the other, on an average, from the mine-run quotations ranging from $3.50 to $4.50, which prevailed at the first of the year.

This situation confined the trade to practically spot channels. While of course some contracts were executed, they were based on prices closely approximating spot figures, and were intended primarily as a means of securing priority shipments over the spot customer, or securing for the mines a more liberal supply of cars, the lack of which caused much loss of time to operations during this period.

Domestic coal sales were confined rather closely to current and near-future requirements during the first quarter of the year, prices ranging from $4 to $5 per net ton mines for lump and egg grades. Unseasonable weather caused a spasmodic demand and a slight decline in prices during the latter part of this period, but inquiries stiffened sharply in April. The usual schedule on domestic coal issued Apr. 1 was not announced until about the first of May, prices being as follows per net ton mines:

	Lump and Egg
Big Seam	$2.40
Carbon Hill	2.65
Cahaba and Black Creek	3.40
Montevallo	3.65

Contracting by retailers at the above figures was more limited than in previous years, the usual eagerness to cover reasonable stocking requirements being little in evidence. In the meantime the steam market had taken on increased activity and a strong buying movement developed which could not be fully supplied. Domestic mines withdrew the above schedule and placed their free coal on the open market at prices ranging from $4 to $5 per net ton mines for lump and egg grades. This somewhat checked domestic inquiry, and much of the output was diverted to steam channels where mine-run was quoted at from $3.50 to $4.50 per net ton at mines. Stipulated deliveries on contracts through the spring and summer months could not be adhered to on account of shortage of equipment for loading, and labor shortage and disturbances which materialized more noticeably during the summer. As a consequence, accumulation of stocks in retail yards did not assume 50 per cent. of the usual tonnage.

On July 1 the first efforts of the Federal Government at price regulation in the coal fields were noted by the naming of the so-called "Peabody" schedule, fixing a maximum mine price of $3 per net ton on Big Seam and similar grades, $3.50 for Carbon Hill, Pratt and Corona, and $4 for Cahaba and Black Creek. These regulative figures were accepted by the mines with little or no complaint, and did not visibly affect trade conditions, as they closely approximated the current quotations.

However, much dissatisfaction was expressed by certain Government officials over the Peabody figures, it being claimed that they were too liberal to the producers, and steps were taken for a downward revision, which was announced by Administrator Garfield on Aug. 21, when the following mine prices were named:

	Mine-Run	Prepared Sizes	Slack or Screenings
Big Seam	$1.90	$2.15	$1.65
Pratt, Jagger and Corona	2.15	2.40	1.90
Cahaba and Black Creek	2.40	2.65	2.15

The effect of this schedule was to paralyze the trade, and during the period intervening between Aug. 21 and Oct. 1, when mines were reclassified and revised figures

issued, very little coal was sold. In the meantime the mines had ample business in hand to absorb their output, which had been curtailed considerably by labor troubles (culminating in a strike Aug. 20), and by car supply. Deliveries on contracts were much delayed, and only slight interruption to the output was occasioned by lack of new business.

Vigorous protests against the new schedule were immediately made to the Fuel Administration to the effect that its enforcement would cause the closing down of many mines where cost figures exceeded the selling prices named, and in other instances where the margin of profit would not justify operations. Mine owners were instructed to compile cost sheet data justifying their claims of the unfairness of the schedule, and such information was prepared and placed before the Federal Trade Commission and Fuel Administration by a committee of operators. This resulted in a reclassification of some of the mines and a revision of prices, as shown in the following schedule issued Oct. 1:

	Mine-Run	Prepared Sizes	Slack or Screenings
Big Seam	$2.15	$2.45	$1.85
Pratt, Jagger, Jefferson, Nickel Plate, Coal City	2.35	2.65	2.05
Cahaba, Black Creek, Brookwood, Blue Creek	2.85	3.10	2.45
Corona	2.40	2.75	2.05
Montevallo	2.40	4.00	2.15

The readjustments effected by these revised figures afforded in the main a fair measure of relief to the producers, and were accepted as satisfactory under conditions obtaining, except that in a few instances operations were carried on under peculiar conditions, which increased the cost over other mines in the same class. Also wagon mines claimed that provision should be made for absorbing in the mine price the expense of hauling their output to railroad cars. These complaints are now pending adjustment.

Trade Rapidly Readjusted Itself

The trade rapidly adjusted itself to the revised figures, but during the last quarter the shortage of steam grades was further accentuated by the ever-increasing demands, and efforts of both producers and distributors were taxed in taking care of contract obligations and, so far as possible, supplying the spot demand. Only a judicious and careful distribution of the supply prevented loss of time in plant operations and closing down of public utilities. Much confusion and perplexity were occasioned by the many regulatory instructions issued by the Fuel Administration affecting the handling and distribution of coal output.

The fixing of prices of coal at the mines was followed later by the issuance of instructions regulating the retail prices on domestic fuel, based on the gross margin of profit made by dealers in 1915, plus 30 per cent. This caused much confusion among the retailers as to the proper price to be charged householders under this ruling. Dealers were finally summoned before the local fuel boards, which were empowered to fix a schedule of rates to be charged by each yard, and the prices named by these boards were made effective. The further troubles of the retailers the balance of the year were confined to efforts to get a sufficient coal supply to fill orders of their customers. Yards were kept in a practically cleaned-up condition during the last quarter of the year, much suffering being occasioned by the scarcity of domestic coal both locally and throughout territory supplied from this field. The prices fixed by the fuel board on domestic coal only effected slight reductions in some grades, and served chiefly to prevent further increases in quotations on account of the acute shortage. Schedules ranged about as follows:

	Lump or Nut
Montevallo	$6.25@6.50
Cahaba and Black Creek	5.60@5.90
Carbon Hill and Corona	5.00@5.50

Production in the Alabama field for 1917 will approximate 21,000,000 net tons according to the estimate of Chief Mine Inspector Nesbitt. This is 2,750,000 tons in excess of the 1916 output, the previous maximum production of the state. The demands made upon this field caused great expansion in coal-producing facilities and scores of old abandoned operations were rehabilitated, improvements made at established mines to increase output, and many new operations started. New developments, other than those merely contemplated to meet present market conditions, were not material factors in adding to the output during the past year, due to the great delay experienced in securing material and equipment for permanent and substantial construction. A number of new mines will, however, be in position to add a heavy increase to the state's production in 1918.

Buffalo Coal Trade in 1917

By J. W. Chamberlain
Buffalo, N. Y.

The year 1917 created many and wide changes in the coal trade, especially the bituminous branch of it. Not a day passed without complaints of shortage, and the year closed with the situation worse than it had been before and the prospect that many branches of the manufacturing trade must speedily curtail operations.

For a long time the complaint was chiefly of lack of miners, but at the end of the year the car shortage was said to be responsible for the difficulty. The roads are not blamed, however, for they have not felt able to increase their equipment while fuel consumption is much greater now than ever before. Thus far Buffalo has contented itself with trying to urge coal forward and has not taken up devices for reducing the consumption in those cases where the need is a minor one. This, however, will have to be done soon.

The great difficulty at the close of the year was that the bituminous jobbers could not get coal at Government prices and practically will have to go out of business until a change is made in their favor. Some business is still being done with Canada, especially as the margin allowed to jobbers is larger there than it is here. The great scarcity of uncontracted coal will doubtless be a handicap while the present state of things lasts.

In anthracite the close of the year showed better conditions than formerly. Coal could be brought here by big train loads from the mines any day, and this was done often enough to convince consumers that no real famine is possible, even if natural gas failed.

With no figures to confirm it, the opinion is that Buffalo has handled and transmitted more coal in 1917 than in any former year, both anthracite and bituminous. The coal authorities still refuse or neglect to compile figures to show the actual movement.

In the Lake trade Buffalo has been more active than

usual, having shipped 4,106,598 net tons to the Upper Lakes as against 2,800,740 tons from home docks and 750,000 tons from Erie, Penn., in 1916. The season was closed by the big storm of Dec. 9, or the amount would have been increased considerably.

The year has made few changes in the trade personnel. Several new jobbing firms started up early in the year and did a heavy business till the Government price was fixed in August, when they dropped to a low level and are now waiting for further developments. They include W. B. Nicol & Co., the Century Coal Co., the Montour Coal Co., the Frontier Coal Co., and the Wistar Coal Corporation. All the active members of these concerns were already in the business before. No old firms have gone out of business during the year.

The only mining change of account was the organization of the Corson Byproduct Coal Corporation, of Buffalo, with property at Elkhorn City, Pike County, Kentucky. This company has completed its developments and is now ready to make shipments.

The New York Coal Trade in 1917

By R. W. MORRIS
Brooklyn, N. Y.

SYNOPSIS — *Hardships, uncertainties and disappointments characterized the year 1917. While receipts were heavier than during the previous year, yet the demand was such as to more than absorb all coal arriving. Never was bunker coal so scarce or so many ships tied up in New York Harbor awaiting bunker coal.*

THE year 1917 has been one of many hardships for the coal trade. In no previous year in the history of the industry has the coalman encountered so many difficulties. It has been a twelvemonth of trouble which kept the trade in a continual state of unrest and uncertainty, and it cannot even now be said that these troubles are near their end. And, facing these troubles, the trade has not had the support of the public which, not knowing the underlying reasons, took occasion to put the blame entirely on the dealers without investigation and without trying to learn the true facts before passing judgment.

At no time was the local trade able to get all the coal needed. The year started with stocks depleted and there have been days when not a cargo of either free anthracite or bituminous could be picked up in the harbor. This condition of affairs was aggravated when the Government in August fixed the price at $2 per net ton at the mines for bituminous fuel. Operators promptly diverted their product, which was already down to almost actual needs owing to labor and car shortages, to their contracts which had been closed early in the year at higher prices. This created a still greater shortage of spot coal.

In addition, priority orders issued by the Railroad War Board directing preferential shipments to the west and later to New England took more coal from this market.

The announcement that the Federal Government had fixed coal prices was no surprise to the trade, it having been the belief that such action would be taken. But when the price of $3 at the mines agreed upon at a conference with operators was upset and the $2 price fixed by President Wilson, the operators appeared to lose heart, as it was already costing some of them more than that sum to produce coal.

The anthracite industry fared better although there was a continual heavy demand during the entire year. Temperatures were below normal most of the time and fires which under ordinary weather conditions would have been extinguished early in April were kept burning until June. Bins were empty and the coal which would have been stored during May for the coming winter was consumed, thus creating an increased demand which the operators could not overcome.

At no time were the producers able to send to this market all the coal needed. While the tonnage figures showed shipments during some months larger than ever before, other sections of the country were just as anxious to get coal as was this market.

Market conditions were little affected by anthracite price fixing since the Government practically indorsed the existing prices for the domestic coals and advanced the price of pea to $4 per ton at the mine, an increase to some operators of $1 a ton. Later on this order was modified to the extent of reducing the price for pea coal to $3.40 per ton at the mines. Still later, early in December, following a series of conferences between the operators and representatives of the mine workers, wages were increased and the operators were permitted to add 35c. per ton to the prices as fixed by President Wilson.

There were several investigations during the year both of the wholesale and retail interests, none of which resulted in anything being accomplished. Almost throughout the entire year the local trade has been under the supervision in one way or another of representatives of the Federal Trade Commission or of the Fuel Administration, who have always received the hearty coöperation of the dealers, both wholesale and retail.

An indication of the seriousness of the coal situation here may be found in the fact that in April last when bids were asked by the Government for furnishing between 60,000 and 100,000 tons of bunker coal for the Panama R.R. no proposals were received.

The situation with regard to the smaller anthracite sizes used for steam purposes was extremely serious all year. There was a heavy demand and prices remained high. Operators were not inclined to make their usual contracts and retail dealers were thus unable to close their usual agreements with the owners of the office buildings and similar structures where the buckwheat coals are used in large quantities. It was a "hand-to-mouth" trade and in the early fall it became necessary to curtail consumption wherever possible. In November many of the owners of office buildings sent notices to

their tenants setting forth the situation and requesting that wherever possible electricity and heat be saved.

An important movement during the year was the organization of the Wholesale Coal Trade Association with a membership of more than half the wholesale dealers located in New York City. This organization, although newly formed, has already taken a prominent part in coal matters both here and in Washington.

The Anthracite Situation

The year opened favorably for anthracite consumption. Weather conditions, however, interfered greatly with the handling of coal at the docks and supplies were scarce. These conditions were reflected in the quotations for individual coals of from $8.75 to $9 for mixed domestic sizes. Offers to furnish the New York City departments with buckwheat No. 1 were submitted at a price of $7.69 per ton.

Low temperatures kept prices for individual coals up and supplies tightened to such an extent that when the city asked for bids for domestic coal the best it could get was from $9.98 to $10.87 and from $8.85 to $9.48 for pea coal.

In February conditions became worse. A heavy snowstorm caused a sharp advance and there was a general clearing out of all speculative coal at the New York Tidewater. Retail dealers who had been for several weeks finding it harder and harder to obtain coal began to get anxious as to their future supply. Few contracts for the buckwheat coals that were closed showed advances of from $1.25 to $1.50 per ton over the previous year's figures.

By March conditions outrivaled any previous situation with regard to supplies. Stocks were at their lowest ebb and individual coals were quoted at about $1 above the regular company schedule. Under ordinary conditions demand would have fallen and individual coal would have been selling below the usual April prices.

The coal year opened on Apr. 1 without the usual activity in coal movement, for the reason that there was none to move. Stocks were depleted and although the Spring discount had been applied to egg, stove and chestnut coals, the wholesale interests had none to offer for immediate delivery, although they were willing to accept orders subject to delivery up to May 1. Dealers' books were filled with orders and buyers were hard after deliveries. Prices for individual coals were governed almost entirely by the weather temperatures. There was a heavy call from the West and the producers diverted considerable tonnage to western points.

In May there was an advance of 25c. per ton for domestic coals to cover an increase in wages granted the mine employees although their agreement with the operators had three years yet to run. This was in addition to the usual monthly advance of 10c. made during the five summer months to cover the spring discount. This made the prices for white ash coal at the lower loading docks in this harbor as follows: Broken and egg, $5.30; stove, $5.55, and chestnut, $5.60.

Inquiries were plentiful but receipts were below normal. Coal was being sent into New England to meet the increased demand. Individual operators were getting more for their coal from inland dealers than they would have gotten on a Tidewater basis and their coal moved accordingly. The daily newspapers began to print scare articles of a possible coal famine and this resulted in a more urgent demand.

There was a let-up in demand in June but this did not relieve the situation sufficiently to head off an appeal from the up-state mayors to the President to make it possible to purchase coal at reasonable prices. In spite of the heavy production the law of supply and demand prevailed and the individual operators had no trouble in getting rid of every pound of coal produced by them. The retail dealers too were getting more than normal tonnage but were filling their customers' bins. Stocks were low at Tidewater and middlemen who depended upon free coals found little to pick up.

The first quarter of the coal year showed a good increase in production, much of which was attributed to the distribution and use of the small sizes. Market conditions were reversed for this time of year. Instead of a practically dead market conditions were as tense as they usually are in the middle of winter. There was no easiness in the trade. The mines were striving to get out a maximum tonnage and dealers were endeavoring to relieve themselves of the many orders on their books, some of which had been entered in April. The situation assumed a more serious aspect. Instead of the usual surplus of coal everybody was short and the bulk of the receipts were being stored in cellar bins. The steam coal situation continued to be strong but prices were easier.

Conditions did not show any improvement in August. Producers were making a record for themselves while the dealers were as busy as if it had been mid-winter instead of mid-summer. As was to be expected, there was a let up in the call for the buckwheat coals, but even at that there was little opportunity for the operators to place these sizes in storage.

On Aug. 23 President Wilson announced the prices at which the anthracite coals could be sold, permitting individual operators 75c. more than the prices for company coals. There was practically no change made in the existing schedule, which to many indicated that the Federal authorities were satisfied that the producers had not taken advantage of the public in setting their prices.

For several weeks dealers had been waiting for the Washington announcement and they were now satisfied. The industry seemed to take on greater activity and operators did their best to increase production. The situation in the bituminous market was being reflected in the demand for the buckwheat coals and the surplus of these sizes was soon removed.

Dr. Garfield Cautions Buying Public

About this time Dr. Garfield, in a statement, cautioned the public about buying too freely at the then existing retail prices but to wait for the announcement of the retail prices to be fixed under Government supervision. This advice was to all intents not followed, for consumers kept on clamoring for fuel.

With the approach of late fall conditions did not improve and it was apparent that the trade was to face a hard winter. The domestic coals were scarce and the authorities had ordered heavy shipments to relieve the western situation before the close of Lake navigation. This resulted in the receipts at New York Tidewater being further reduced and appeals were made to the Fuel Administration for relief.

Reports of factories and various other plants closing down because of the scarcity of fuel became current and some had to suspend operations temporarily. This relieved the situation with regard to barley coal but this relief was only temporary.

November and December proved to be active months. Supplies were extremely scarce and many middlemen had no coal to offer. The companies were scarcely able to take care of their regular customers here, much of their output being sent to the West and to New England.

Local conditions were extremely serious, particularly among those who live in the poorer sections of the city and who buy their coal by the pail or hundred-weight.

The year ended in a whirlwind rush. In the first place two heavy storms tied up shipping and deliveries, and one of these storms was followed by intensely cold weather for the early part of December, while during the last few days of the month the mercury registered near or below the zero mark, causing much suffering.

Early in the month the operators were given permission by the Federal Fuel Administration to increase their prices 35c. per ton, the mine employees securing an advance in wages at the same time which practically absorbed the entire increase in the price of coal.

Coal movement was at low ebb. No one had anything to offer and the retail dealers were being rushed for fuel. The situation became extremely serious and the fuel administrators called in the dealers to assist in solving the problem. Committees were appointed and it was agreed to adopt the fuel card system, whereby a buyer had to signify the actual condition of his bin. It was also agreed that the coal peddlers would be given a certain tonnage weekly.

Many yards were without stocks most of the time and there were intervals during which the city contained less than two days' supplies. Efforts were made in all directions to conserve fuel, such as keeping dark the electric signs along Broadway two nights each week, and tenants in the big office buildings and elsewhere were asked to be as saving as possible with heat and light.

The Bituminous Situation

Conditions in the bituminous market paralleled the anthracite situation in many ways. There was a shortage of coal nearly the entire year, together with a labor shortage and poor car supply. At the opening of the year there was a sluggish demand and congestion at the piers. Contract making was not brisk at the prevailing quotations of from $2.75 to $3.50, with most of the larger companies closing at the last named figure. Some buyers hesitated before signing for the year's supply believing that better bargains would be had later on.

The question of providing bunker coal was brought to the front early in the year by the crisis in international affairs. Congestion at the piers crippled the railroads and the lack of bottoms for export trade caused a serious blockade and numerous embargoes. The railroads began to pick up heavy tonnages of fuel for their own use. Manufacturers began to feel the pinch early in March and numerous complaints were made. There was a stiffening of prices.

The threatened railroad tie-up caught New York with less bituminous than had been on hand for some time. Shipments had been light for several weeks and operators were getting behind on their contracts. The settlement of the impending railroad labor trouble caused a downward trend in prices, car supply showed a slight change for the better and there was an easier feeling all around.

In May the high grades were scarce for the spot buyer, all of these coals being applied on contracts. Car supply showed a slight improvement but this was only temporary. Indications pointed to strenuous times ahead. Stocks were low and there were no prospects of production being increased until the railroads were able to supply more cars. The market was over-run with buyers, many houses having sent representatives to the mines.

Buying which had been largely governed by weather conditions began to ease up in June and there was a slight sagging of prices.

The question of pooling all shipments of coal to Tidewater was agitated at this time and the announcement was made that it would go into effect on July 1. At this time the towing rates were advanced, adding another burden to the shippers' troubles. The miners were also granted an increase in wages although their contract did not expire until April of 1918.

Revocation of Price Agreement Upsets Market

Two innovations to the trade, that of Government price fixing and the pooling of Tidewater shipments, which it was expected would be put into effect early in July, were temporarily postponed. The agreement as to the $3 coal and its subsequent revocation upset the market. Operators showed themselves dissatisfied with the outcome and the supplies did not increase. Middlemen, as a rule, were without coal early in August. Movement was slow and the railroads were confiscating everything they needed for their own use. Demand was on the increase.

Operators were asking the Government to fix a price of about $3.75 when the President announced the schedule of $2 per net ton at the mines. There was much confusion, many operators claiming they could not afford to mine coal at that price and many were already paying more than that to produce it.

Manufacturing plant owners were appealing to Washington because of the lack of supplies and those who had neglected to make contracts prior to the President's announcement realized that they would be hard-put later in the season.

The issuing of the priority order providing for shipments to the West tended to remove more coal from this market. Operators were taking care of their contracts as best they could and spot coal was a real scarcity. Poor car supply and the shortage of labor had become serious.

Labor conditions were relieved somewhat when the operators were allowed an increase of 45c. per ton which was at once absorbed in wage increases. But this did not increase the quantity of spot coal, the operators being no better off financially than they were with the $2 price.

A better car supply was promised early in November, but it was not obtained. The ruling of the Fuel Administrator permitting jobbers to add a 15c. commission to coal which they contracted to buy previous to Aug. 21 proved to be of some slight benefit to the market. At about this time the scope of the Tidewater Pooling Ex-

change was enlarged by an order including in its membership all shippers of bituminous. This resulted in about 10 per cent. of the shippers here, who had not already joined, becoming members of the Exchange.

Business was practically at a standstill the latter part of November. Middlemen who depended upon free coals had no business except to look after their contracts. Some light was seen, however, by the cancellation of the priority order on shipments to the Lake ports, which went into effect Nov. 30.

Bituminous Prices

The following table shows a comparison of prices for bituminous coal, f.o.b. at the various loading piers in New York harbor:

Month	George's Creek	Clearfield	Nanty Glo	Quemahoning	Fairmont	Mine Price
January	$7.25 to $8.25	$6.75 to $8.00	$6.75 to $8.00	$6.75 to $8.00	$6.75 to $8.00	$4.25 to $6.75
February	7.00 to 8.00	6.50 to 7.50	6.75 to 7.75	6.75 to 7.75	6.25 to 7.25	4.50 to 6.50
March	7.25 to 8.25	6.75 to 8.00	7.00 to 8.00	7.00 to 8.00	6.50 to 7.75	4.75 to 6.50
April	6.75 to 7.25	6.25 to 6.75	6.75 to 7.25	6.75 to 7.00	6.25 to 6.75	4.00 to 5.25
May	6.75 to 8.25	6.25 to 8.00	6.50 to 8.00	6.50 to 8.00	6.25 to 7.50	4.50 to 6.75
June	7.25 to 7.75	6.75 to 7.25	7.00 to 7.75	7.00 to 7.75	6.75 to 7.25	4.75 to 6.25

With the mine price at $3 net ton, the f.o.b. price to consumers, gross tons, for screened coal was $5.85; mine-run, $5.29, and slack, $5.29. Coal for bunker and export was selling on the basis of $6 to $7 alongside.

The fixing of the price at $2 by the President's order, made the f.o.b. prices for coal from Pennsylvania, Maryland and northern West Virginia, consumers, as follows: Screened coal, $4.83; mine-run, $4.53, and slack, $4.27.

The most notable feature during December outside of the extreme shortage of coal was the increase of $1.35 net ton allowed on coal for bunker or export trade.

At no time was there any free coals available at this market. Industrial plants were closed on account of having no fuel and conditions were unprecedented. Shipping conditions were unparalleled. Vessels aggregating close on to 1,000,000 tons were tied up in New York harbor because of the lack of fuel and among them were several transatlantic passenger steamers, some of which waited five days for supplies.

The hopes entertained by shippers that the close of navigation on the Lakes would bring more coal to this market were not fulfilled up to the end of the year.

The Retail Situation

The New York retail trade had anything but a rosy time in 1917. After going through several investigations out of which nothing developed, the year ended with conditions worse than at any previous time in the history of the trade. There was very little coal to be had, many yards were closed and there were reports that the drivers were ready to make demands for an increase in wages which if granted would result in changes being made in the calculations of the dealers upon which were based their contentions for the fixing of a gross margin, including profit, for handling coal and which was at the time, being considered by the Fuel Administration officials.

At no time during the 12 months did the dealers have sufficient coal to meet demands. Coal-burning weather continued well on to the first of June and the coal which under ordinary circumstances would have been in some consumers' bins was burned. Some dealers booked orders early in April, as usual, but carried them unfilled until well into the fall.

The shortage of coal began to make itself felt with consumers early in the fall and when the public got ready to light its fires and learned the true conditions, it became excited and demanded coal. Other sections of the country were in the same position as regards supplies as was New York, and the local dealers got no more than their share.

Government reports showed that the New York market from April to October had received from 6 to 8 per cent. more of the domestic sizes than during the corresponding period of 1916, but this increase had been absorbed by heavy consumption in April and May while heavier tonnages had been stored by house owners who had realized the conditions.

Conditions became such in November and December that efforts were taken by the fuel administrators and the dealers to protect the small buyer in the poorer sections of the city, and after several conferences it was stipulated that a certain tonnage would be sent into these sections each week.

New York Coal Exports in 1917

With the exception of coke, exports from this port were smaller for the twelve months ending Nov. 30, 1917, than for the twelve months ending Nov. 30, 1916. For 1916 there were exported 201,691 tons of anthracite with a valuation of $1,112,377; 40,181 tons of bituminous, valued at $154,102; and 17,311 tons of coke with a valuation of $128,996.

During the 12 months ending Nov. 30, 1917, the exports were as follows:

1916	Anthracite	Value	Bituminous	Value	Coke	Value
December	9,474	$62,298.00	4,430	$25,358.00	535	$9,317.00
1917						
January	7,934	65,068.00	2,049	9,246.00	1,660	10,972.00
February	4,981	35,362.00	1,731	6,796.00	1,211	11,383.00
March	13,720	105,657.00	3,224	19,649.00	505	6,273.00
April	8,339	53,106.00	171	1,774.00	1,325	18,107.00
May	16,714	133,327.00	995	7,147.00	1,900	38,063.00

November	10,856	75,502.00	1,229	9,830.00	304	7,709.00
Total	136,856	$1,002,222.00	17,819	$108,840.00	20,727	$272,245.00

The average cost per ton received for the anthracite coal was $7.32; for bituminous, $6.10, and for coke, $13.13, as compared with $5.52 for anthracite, $3.83 for bituminous and $7.45 for coke in the corresponding months of the previous 12 months.

Coal Carried on New York State Canals in 1917

During the season of 1917 there were carried on the canals of the State of New York 169,107 tons of anthracite and 65,834 tons of bituminous. During the 1916 season there were carried 163,647 tons of anthracite and 49,747 tons of bituminous. There is thus a slight increase in the carriage of anthracite and a decided increase in the carriage of bituminous.

Philadelphia Coal Trade in 1917

By W. D. HAMMER
Philadelphia, Penn.

SYNOPSIS — *The year just past was unsatisfactory from several standpoints. The demand was never satisfied and margins of profit were often small. Although more coal was received than ever before receipts were not sufficient to meet increased industrial and domestic consumption.*

Anthracite

THROUGHOUT the year 1917 the dominating factor in the anthracite trade was the question of supply. This was always behind the demand, even in the usually dull summer months. The year started with all interests clamoring for more coal, yet never being able to catch up with their needs. During the month of January the weather was somewhat mild and this helped the trade during what otherwise promised to be a trying season. The sizes in strongest demand were stove and pea, and at times the individuals were able to obtain premiums as high as $1.75 for these sizes. In the steam coals there was a particularly heavy demand for buckwheat, with many premium sales around $3.75, and some reported at $5 occasionally, as against the company circular of $2. During this month many of the individual shippers advanced their prices 25c. a ton to their regular customers.

With winter weather in February the demand became heavy and premiums became quite common, with a flat price of $5.50 being paid for egg, stove and nut coal. Pea was especially scarce and many dealers were unable to obtain anywhere near the quantity required. During this month the Philadelphia & Reading Coal and Iron Co., the leader in the trade, issued a new circular in which it eliminated quotations on all sizes except egg, stove, nut and pea coal. The quotations on broken and steamboat coal, together with all the steam coals, were given on application. A surprising feature was the advance of the buckwheat price to $2.50 per ton to those not covered by contracts. This brought this size close to pea coal at the circular price of $2.80, and gave the indication that the new contract prices on steam sizes would be considerably advanced.

During the month the District Attorney began an investigation to learn if collusion existed among the retailers to advance prices. The dealers were so busy trying to get coal that this investigation gave them but little concern. They had been investigated at least three times within the two previous years, the latest inquiry only showing that they were working on a narrow margin of profit.

The demand for buckwheat coal continued strong throughout the month, with many users of soft coal evidencing a desire to contract for this size.

March was a particularly exciting period in the trade. Early in the month all sizes were so scarce that the dealers were asking for coal regardless of size. In addition there was much speculation as to what the new contract steam prices would be for the year beginning Apr. 1. Premium prices, the highest of the season, were being paid for all domestic sizes; some of these quotations were as follows: Chestnut, $5.50; stove, $5.40; pea running from $4 to $4.50. Buckwheat continued to be heavily sold around $2.50, while reports were heard of several contracts being made for large tonnages at $3.

At this time there was a reduction of 25c. per ton in freight rates to Philadelphia, making the prepared coal rate $1.40 and that on pea $1.25. The demand for steam coal became so brisk that large quantities of pea were contracted for by manufacturing interests at a price of $3.50. This was 70c. in advance of the current circular price on this size. Toward the close of the month there was much speculation as to whether the companies would make the usual 50c. spring reduction from the circular prices.

Usual Reduction Shocks Dealers

During the last week of the month the dealers almost ceased buying prepared coal, seeming to want as little of these sizes on hand as possible because of the reduced freight rate taking effect in April. There was great surprise when the Philadelphia & Reading company announced its spring circular with the usual 50c. reduction, pea coal being offered by this company at $2.30 at the mines.

The individual shippers were shocked at this price. The other large companies followed the lead of the Reading except as to pea coal, which some priced at $2.80 and others at $3. It was felt, however, that there would be little coal for sale in view of the heavy contracts entered into by the large companies. As to steam coals the same prices that had been in effect all winter were adhered to. Several of the large companies announced that they expected to contract their coal to a very limited extent, something entirely new to the trade.

With the announcement of the 50c. reduction in April the retail men were flooded with orders. The general public had become convinced that coal was going to be scarce during the coming winter and therefore ordered for spring delivery in a greater volume than ever before. Yet within a week of the announcement of the new prices the shipments on the dealers' orders were so small that they refused to book any more orders until it was seen whether they would receive sufficient coal to fill them. Pea coal was particularly hard to get and as the retail price was based on the Reading company's figure of $2.30 many dealers faced filling orders at a loss. As the month wore on the demand upon the wholesalers became so strong that they no longer solicited business and most salesmen were withdrawn.

Toward the end of the month with war imminent the people became particularly anxious for coal, especially on early orders. The miners also demanded an increase in wages and the retail men feared if this were granted they stood to lose considerable money on orders booked during the first part of the month,

as there was small doubt that if the miners received an increase this would be added to the wholesale price of coal. Shipments to this market did not improve and the individual shippers in particular seemed to have deserted this district in favor of New England where dealers were willing to pay $1 above the winter circular in order to secure coal.

With the granting of an increase of 20 per cent. to the miners an entirely new circular was issued for May. This showed increases averaging about 30c. on all sizes, and made the new prices as follows: Broken, $4.90; egg, $4.05; stove, $4.30, and nut $4.40. Pea continued to vary, ranging from $2.70 to $3.10, with the individuals from 10c. to 40c. higher. Deliveries to dealers were so limited that some only took orders subject to delivery within a month or six weeks, while others refused to make a price at all. During this month some of the larger companies changed their attitude as to not contracting on steam coals and closed business with some large plants at good figures.

During this month there was a considerable reduction in the premium asked for coal by the individuals. This was solely because the Federal Trade Commission at this time made suggestions as to prices. While the commission did not have the power to enforce its suggestions, yet there was quite a tendency to heed its edicts. Even at that most of the coal mined was rushed to the New England market and the dealers here received but little tonnage. Dealers who for years had been accustomed to lay in a stock of pea coal now became considerably concerned since they had not as yet been enabled to store any of this size.

Trade Being Placed on Cash Basis

One of the few cheering features of the trade was the fact that business was rapidly being placed on a cash basis. Shippers were insisting that accounts be paid when due and dealers in order to meet obligations refused to make deliveries without prompt payment.

With the coming of June and the first warm weather there was some slackening in the demand from the consuming public, but dealers did not slacken their efforts to secure every ton possible. A fair average of retail prices at this time was as follows: Egg, $8.25; stove, $8.50; nut, $8.75, and pea, $6.75. Premium wholesale prices were within the 75c. maximum over the circular prices as suggested by the trade commission.

During the month the courts declared the last of the anthracite tax laws unconstitutional. Although the dealers are thus entitled to a refund, the repeal attracted practically no attention whatever and it may be years before anyone asks for a refund.

Shipments were severely impeded all this month by various car restrictions and as a consequence receipts here continued to be light, but with promises that good deliveries would soon be forthcoming.

The individuals advanced their prices generally to the full 75c. maximum above company circular as allowed by the Federal Trade Commission. This made their prices as follows: Egg, $4.90; stove, $5.15; nut, $5.25, and pea, $4.45. While the companies' shipments to this city were light, yet because of the increased prices the individuals made good deliveries.

The local coal trade had expected good shipments during July, after repeated promises to this effect. However these failed to materialize. The retail dealers now also realized that they would not be able to get any pea coal for storage, the current demand being far in excess of receipts. The prices of the individuals for this size now ranged from $3.70 to $4.55 at the mines, as compared to the circular figure of $3.20. There was some weakening of steam coals at this time, particularly barley, which at times became so heavy that some of the big companies stored quite a quantity of it, as well as rice. The quantity was, however, meager compared to that stored in former years. The car supply was at this time quite troublesome and all companies began shipping in box cars. This was a distinct innovation, but the readiness with which dealers took coal in this class of equipment was a strong proof of the need of fuel.

The Federal Trade Commission continued its activities throughout this month, requiring statements of various kinds from the dealers and in many instances had representatives getting information first hand from their books.

One of the most important events in the history of fuel occurred in August, when the President issued his order fixing the price of coal at the mines. The order which was handed down on Aug. 23 gave the following prices, which were to become effective on Sept. 1.

	Broken	Egg	Stove	Chestnut	Pea
White ash	$4.75	$4.45	$4.70	$4.80	$4.00
Red ash	4.75	4.65	4.90	4.90	4.10
Lykens Valley	5.00	4.90	5.30	5.30	4.35

These prices were fixed for the so-called "companies" or those popularly supposed to be closely affiliated with the carrying roads. For the other shippers, who are usually classed as "individuals," a maximum price not exceeding the above prices by 75c. could be charged. The jobbers' margin was also fixed at not exceeding 15c. per ton of 2000 lb., or 20c. per ton of 2240 lb. when coal was intended for delivery at or east of Buffalo, N. Y. West of Buffalo the margin was fixed at not more than 30c. An additional brokerage charge of 5c. per ton was also fixed for such coal as had to be re-screened for trans-shipment at an Atlantic or Lake port. Coincident with the price-fixing order the President appointed Dr. H. A. Garfield as National Fuel Administrator. Dr. Garfield immediately set about appointing a coal administrator for each state, who was instructed to appoint local committees for each community.

Due to extremely warm weather during the month the trade lost some of its nervousness, although there was a demand for every ton of the domestic sizes produced. If there was one weak size it was chestnut, but even this was eagerly taken by the retail men, as they realized that nut would be called upon to fill orders that usually called for pea. With the exception of buckwheat the steam coals continued somewhat weak throughout the month. At times rice could be purchased freely at $2.15 per ton, while in many instances barley sold around $1 a ton. The circular prices of these sizes at this time were $2.40 and $1.90 respectively. Many concerns took advantage of the situation and stocked heavily of both sizes. The companies also turned a fair tonnage into their own storage yards.

The trade quickly adjusted itself in September to the new wholesale prices as fixed by the President, although

much surprise was manifested at the pea coal price of $4 as against the $3.10 figure which had previously been fixed upon by the Reading company for fall and winter. This company finally issued a circular embodying this price. While most of the individual shippers took the full maximum of 75c., there were a number that did not add the full amount, while one added 15c.

As the month opened with summer weather there was no real activity until about the middle of the month, when the arrival of cold weather sent buyers scurrying to the coal dealers. Conditions at times bordered on panic as the people endeavored to assure themselves of a supply of fuel. Retail prices advanced under the new wholesale rates and one of the representative companies issued the following retail prices: Egg, $8.25; stove, $8.50; chestnut, $8.75, and pea, $7.75. Shipments from the mines in no way increased and many of the dealers with heavy orders taken at the April prices were becoming anxious about their ability to fill these orders.

While the steam coals opened the month with the same weakness that characterized them in August, they began to pick up noticeably with the coming of the cool weather. As the Government price-fixing order did not include the steam sizes buckwheat was selling at this time for as much as $3.75 a ton, although barley and rice could be bought close to circular, not having entirely recovered from the weakness manifested all summer.

Throughout the month there were persistent rumors that the Government had realized its error in fixing the pea coal price at $4 f.o.b. mines. Many protests had been made to Washington and when the President issued a supplemental order on Sept. 30 reducing this price to $3.40 for the white ash grade, it evoked no particular surprise. The price became effective the next day, Oct. 1.

The real event of this month, however, was the order issued the same date, Sept. 30, fixing the retail price of coal. This was to be determined under the plan promulgated by Fuel Administrator Garfield as follows:

"The retailer ascertains his retail margin in the year 1915, when more normal conditions prevailed than at present. To this he may add not to exceed 30 per cent. of that margin, which, of course, includes his profits at that time. It is provided, however, that in no case shall the gross margin added by any retail dealer exceed the retail margin added by him during July, 1917."

Dissatisfaction Comes with Price Fixing

There was much dissatisfaction over the retail price order, as many claimed they could not do business on such a close margin, and that they should at least be allowed a gross profit of $2.50 a ton. Under the new plan prices were also to be fixed every two weeks based upon the coal which had been purchased in the preceding two weeks.

The dealers were somewhat slow to adopt the new price schedule during the early days of October. The reduction of the wholesale price of pea coal also caused much confusion, for while the consuming public expected cheaper fuel there was really little pea coal to be had and many dealers were at times without this size for weeks.

During October the steam coals became quite strong again, with buckwheat early in the month bringing $4, and rice and barley freely taken at $2.85 and $2 respectively. There was also quite a demand for culm for mixing with bituminous coal at a price from 75c. to $1.

On Oct. 3, William Potter, former minister to Italy, was appointed state fuel administrator, and on Oct. 10 he appointed Francis A. Lewis chairman of the Philadelphia coal committee. Coincident with this appointment the retail men adopted the retail price schedule as directed by the National Administrator, although still claiming they could not do a profitable business on the margin allowed. The demand for fuel now became so strong that the dealers ordered regardless of size, simply asking that coal of any size be sent to them. Under the new system there was a great variety of prices, hardly two dealers quoting similar figures.

Government Complicates Distribution

Throughout the month the amount of coal received in the city was far less than the dealers demanded, although the claim was made by the companies that the tonnage delivered was much in excess of the previous year. The matter of distribution of the output was further complicated at this time by the heavy demands of the Government for domestic sizes for the various army cantonments throughout the country.

The shortage of coal began to be quite acute with the coming of November and the various coal bodies pleaded with the people to use every economy to conserve the supply. Embargoes on the various lines entering the city became more numerous and greatly interfered with coal movement. Many yards were entirely bare of supplies.

The appeal of the retail men for a flat gross margin of $2.50 per ton was this month taken up with Washington, but the plea was denied. The dealers, however, continued to appeal for an increase. Some representative retail prices at this time were as follows: Egg, $8.35; stove, $8.40; nut, $8.65, and pea, $6.90, all per gross ton.

The steam coals kept increasing in strength as the season progressed and some individual prices were: Buckwheat, $4 to $4.25; rice, $3 to $3.25; barley, $2 to $2.25, as compared to company prices of $2.80, $2.30 and $1.80 respectively.

In this month the mine workers despite a previous agreement demanded an advance in wages amounting to 25 to 30 per cent. Many conferences were held in Washington by the representatives of the men and the operators. The miners and operators finally reached an agreement whereby the former were to receive an average wage increase of 20 per cent., provided the Government would consent to an increase of 35c. per ton in the mines' price of coal. On Dec. 1 the President issued another order granting an increase of 35c. in the wholesale prices. The operating interests protested the order, but finally accepted the advance. In addition to ordering the advance the President in this order also took occasion to state that he would also order a reduction in prices on Apr. 1 next in conformity with the usual custom.

With the new price circular taking effect on Dec. 1

the wholesale prices of white ash coal were as follows: Broken, $5.90; egg, $4.80; stove, $5.05; nut, $5.15, and pea, $3.75. The steam coal prices of the companies were also increased, those of one of the largest shippers being: Buckwheat, $3.15; rice, $2.65; boiler, $2.45.

The coal situation became extremely critical during December, and despite the system of ordering by card there was much actual suffering. People had the money to purchase fuel but the dealers had not enough coal to meet the demand. Winter weather set in during the second week of December accompanied by numerous snow falls. In the coal region there were zero temperatures and several heavy snows. In one week on this account the production was cut almost 50 per cent. Toward the end of the month conditions became so serious that an appeal to Washington was successful to the extent that the authorities there directed that 15,000 tons a day be sent to Philadelphia, although the normal requirements were 18,000 tons. This had the effect of affording much relief.

On Dec. 21 Chairman Lewis of the local fuel committee, with the approval of State Fuel Administrator Potter, issued an order eliminating the plan of fixing the retail prices every two weeks. In its stead the dealers were allowed a gross margin of $2.50 per ton, to date from Jan. 1, 1918. This decision was arrived at after a report had been made by the expert accountants who had gone over the books of about a dozen representative dealers. The new rule occasioned considerable protest on the part of the public and attempts were made to have it rescinded. It was figured that the new method of figuring the retail prices would allow the dealers from 35 to 50c. profit on a ton of coal. At the same time Chairman Lewis recommended to the Federal Fuel Administrator that the plan of allowing the individual shippers 75c. in excess of the company wholesale prices be withdrawn.

While there had throughout the year been some intimation made that this city had been neglected by the shippers, it has been shown by actual figures that more coal by 400,000 tons had been received up to Dec. 1 than ever before. This, however, was not sufficient to meet the increased consumption with industrial plants working 24 hours a day instead of eight, together with the needs of many thousands who came to the city during the past year.

Bituminous

The high price movement that was exhibited in bituminous coal started in the year 1916 and continued into 1917. During the first week of the year prices ranged from $5.25 to $6.75. Labor was restless and even after many operations had granted a bonus of 10 per cent., still further increases were asked. The car supply did not run better than 40 per cent. and was often as low as 20 per cent.

Early in the year one of the largest mining companies announced its contract price as $3.50. There was a rush on the part of consumers to get protection, but most shippers confined their contract tonnage to not more than 50 per cent. of their output and others even lower. Concerns with low-grade coal, however, showed some anxiety to get the top price for contract fuel. Prices of spot coal softened after the first week and closed for the cheaper grades $4.50 to $4.75, and $6 to $6.25 for the best coal.

During the second month of the year there was considerable fluctuation in prices, with a downward tendency somewhat in sympathy with the contract of $3.50. Producers showed more willingness to contract and some business on fair coals was reported closed at $2.75, although the greater portion was taken around $3 to $3.50. Numerous local strikes continued throughout the mining districts, while the car supply at times was so short as to cause operations to suspend for short periods. The price range for the month was from $4.75 to $6.

Because of rail congestion and threatened strikes of the trainmen the fore part of March saw a sudden upturn in prices, the average advance being about $1 a ton. Upon the settlement of the threatened railroad strike prices softened a bit. The demand continued heavy for all grades, but particularly for slack. Considerable sluggishness existed in the export trade on account of high freight rates, scarcity of bottoms and rising insurance. During the month prices ran from $4.50 to $6. Some contract business was reported as high as $4.

Concerns Anxious to Stock Coal

The entry of this country into war in April did not produce any appreciable change in the trade, except that the demand from concerns anxious to stock coal became stronger. Contract prices became firm around $3.50 to $4 and with no particular desire on the part of shippers to seek the business. Wage increases to the amount of 20 per cent. became general in the Pennsylvania districts and affected prices, although with the frequent fluctuations during the month the general average of prices was lower than in the preceding period. There seemed to be a closer grouping of all prices, hardly a dollar separating the highest from the lowest, with an average range of $4 to $5.25.

On account of a threatened strike among the miners prices began to move rapidly upward in May. At this time the Government through the Federal Trade Commission offered to mediate the troubles. This had a calming effect upon the situation, yet prices continued at a high level, approximating $7 in some instances, with the lowest figure around $5.75. The car supply continued unsatisfactory, hardly ever running higher than 40 per cent. of requirements.

The extraordinary demand for coal showed no diminution in June, although on account of the continued rail restrictions the supply hardly met the demand within 50 per cent. Prices had a tendency to move lower during the month, labor troubles having been settled through the Government. Shippers of tide coal, at the suggestion of the trade commission, held many meetings to arrange for a system of pooling tide shipments in order to expedite unloading. Prices in June ranged on an average from $5.25 for the lowest to $6.25 for the best grade of coal.

In July after a conference in Washington between the leading bituminous operators and the Government an agreement covering a fixed price for all bituminous coal, regardless of grade, was entered into. The prices fixed were $3 for mine-run coal and $3.50 for lump, with 25c. additional allowed for coal sold through commission houses. The above prices were for the net ton of 2000 lb. It was further arranged to inaugurate

the pooling system on Aug. 1. There was also considerable improvement in the car supply this month, with allotments as high as 60 per cent. The demand continued heavy, with most of the production being applied on contract business.

With the passage of the Food Control act in August, persistent rumors were afloat that a lower price for coal than the figures agreed upon in July would be fixed. While the larger operators strictly adhered to these prices, numerous sales were reported made at figures from $1 to $1.50 above them, and there was constant newspaper agitation for Governmental regulation. The car supply ranged from 50 per cent. to 60 per cent., with all heavy users making strong efforts to stock coal. On Aug. 21, the trade was stunned by the President's price-fixing order. The prices allowed were $2.25 for screened coal, $2 for mine-run and $1.75 for slack, with 15c. allowed for brokerage on coal thus handled.

With the price of coal thus fixed practically the entire production beginning with September was applied on contracts, which had been taken at figures around $2.75 to $3.50. Even then contract orders were far from being filled. Throughout the month the operators spent much time preparing cost sheets and sending their representatives to Washington in an endeavor to effect a change in prices, which they claimed were ruinous.

Government Starts to Issue Priority Orders

On account of the increasing congestion of rail movement in October the Government began to issue priority orders for shipments of coal to various sections of the country. It also allowed wagon mines to add 75c. a ton to the Government price of $2. This led to the hope that there would be a general increase of prices. New demands were also made by the miners for increased wages and upon an agreement with them being reached the President revised his price order, allowing an increase of 45c. per ton. This it was still claimed by the operators was far short of affording a reasonable profit.

In November the real pressure on the coal trade began. With the car supply worse than at any previous time many small plants at times were closed for lack of fuel. At this time the Fuel Administration made a ruling that coal used exclusively for smithing purposes could be sold at the market price, which in this month ran from $4.25 to $5.75 per ton.

The operators never ceased their efforts to get an increased price on mine-run coal, advocating a figure of $3 as one that admitted of a fair profit. The situation as to supply became so critical that practically all coal toward the end of the month was being shipped on priority orders. In addition regulations were issued cutting down the hours for the lighting of electric signs.

Conditions on the railroads were even worse in December. The Fuel Administration announced early in the month that all new contracts entered into must be supervised by that body. An interesting development of the month was an increase of $1.35 allowed by the Fuel Administration in the price of bunker fuel. During the last two weeks of the year the shortage became so acute that large industrial plants were closed down for a day or two at a time, even those working on Government material. The chief trouble was the inadequate service on the railroads, which were badly congested by freight of all kinds.

Taken in a general way the year 1917 in Philadelphia was one of the most unsatisfactory seasons ever experienced, both from the standpoint of production and investment return. It has been estimated that for the year there would be a shortage in this city alone of a million and a quarter tons.

Ohio Trade in 1917

By J. W. Lehman
Columbus, Ohio

The year 1917 in Ohio, as in other parts of the country, has been quite unusual in every respect. With the country fully launched in the world war and with every effort being made to prepare for the conflict, the coal industry was called upon to do unusual things. While it failed partially under the stress of circumstances, still on the whole the industry responded to the patriotic call of the country, and had it not been hampered by a lack of transportation would have been equal to the occasion.

It has been a strenuous year for the operator, the jobber and the retailer alike. With the public pleading for coal and with transportation congested, it was necessary for the Federal Government to adopt regulatory measures. At first these simply embraced the regulation of prices, but later national and local fuel administrators were appointed and steps taken for the regulation of distribution.

On the whole the year has been a prosperous one for the producer and distributor. In other words the operator has been able to make a fair return on his investment, the jobber because of heavy demand has been able to make rather large profits and the retailer was able to make good profits until restricted by governmental regulation and even afterward the returns were fair. Generally speaking prosperity has reigned in the coal industry in Ohio and the trade is in a better position than ever before.

Prices of course were one of the big features of the year. The year opened with an almost unprecedented demand for coal from domestic and steam users alike. This was the legacy from the preceding year. Prices at the mines ranged around $6 in all fields. There was little distinction made between the various sizes as mine-run, lump and screenings were quoted at about the same figure. This condition was due to the fact that buyers were bidding against each other for available tonnage and price was of little consequence as long as the fuel was secured.

The $5 to $6 price and even higher figures prevailed until the latter part of March when the falling off in domestic demand caused a temporary slump. Prices were rapidly reduced to $3 for mine-run and at one time lump was quoted at that figure. But the recession was only short lived and the unusual demand coupled with lack of transportation caused quotations to soar again. In June operators confronted with the serious conditions met at Washington and under the charge of Chairman Peabody of the National Defense Council agreed to a price of $3.50 for lump and prepared sizes and $3 for mine-run and other grades.

When these prices were fixed, apparently under the approval of the Federal Government, operators settled down to their work, believing that some permanency had been instilled into the trade. But it was only a short time that price stability prevailed and in August the price fixing decree of President Wilson was announced.

Much lower price levels were named and there was considerable complaint on the part of operators. None, however, gave up in despair but continued to push production as much as possible and immediately started work on a plan to secure higher quotations. This work resulted in success and in October advances were given and fair prices have been maintained for the remainder of the year. In October 45c. per ton was added to take care of the increased mining scale and to repay operators for other increases in the cost of production. During the latter part of the year production in Jackson, Burkholz and Palmyra districts was still further stimulated by an advance in price of $1.40 from the previous levels.

As for car service, conditions in various parts of the state varied considerably. Up to October the Hocking Valley district and more especially that section served by the Hocking Valley R.R. had a fairly adequate car supply and production was generally good. A part of the time the car supply was approximately 100 per cent. On the other hand the Toledo & Ohio Central had fewer cars and some curtailment of production resulted. Pomeroy Bend was in fairly good shape until the latter part of the year when car service was curtailed. In Jackson there was a fairly good car supply until the later months and the same is true of Crooksville and Cambridge.

In the eastern Ohio district the car supply was probably worse than in any other section. During the period of the Lake trade there was a considerable supply, but after the priority order was lifted the car supply was reduced to a low ebb. A large part of the available cars were used to load railroad fuel and this cut off the supply for commercial purposes.

The Lake trade was one of the active features of the year. Owing to the priority order, a large tonnage for the Northwest was secured in Ohio. Much of this coal passed through sections which were entirely without fuel and considerable ill feeling resulted. But the net result was that the Northwest was fairly well taken care of from Ohio, West Virginia and Kentucky mines.

The total loadings at the Lake ports in Ohio were larger than in any previous years. It was partly due to the pooling arrangement that such efficiency was attained in the Lake trade.

The year was marked by bad feeling between the public and the coal trade. Early in the year the operators were charged with many offenses, among which was combination to maintain high prices and as a result the public press, especially the newspapers, contained many columns of acrimonious writings. The jobber also came in for his share of criticism and the same can be said of the retailer. But the coal situation gradually became more thoroughly understood and it is now the general belief that the shortage of fuel is due almost entirely to lack of transportation facilities.

Market Conditions in Middle West in 1917

By O. M. BURNETT
Chicago, Ill.

SYNOPSIS—*A continuous coal shortage, a continuous unrest of labor, a continuous excessive demand, a continuous shortage of adequate transportation and almost continuous difficulties in the matter of price mark the past year in the Middle West coal trade. "And the end is not yet."*

THE coal trade has never, nor will likely soon again pass through a more complex and record-making period than the past 12 months. In the beginning of the year, the trade was upset as there was a big coal shortage, and the highest prices ever before heard of prevailing on all grades. This naturally made the buying public wonder when there would ever again be a normal market, when coal would be plentiful, and people would be able to purchase their needs as of old—at their own figure. Unless one has followed closely, and noticed with care the different turns of the market from time to time, it is extremely difficult to understand how so many events worthy of note could be crowded into one single year.

During the first half of 1916 there was considerable coal stored, all of which was consumed in the last half of the same year, thus leaving the storage stocks at the beginning of 1917 practically exhausted, and throwing into the market many large steam buyers, who had rebelled at paying the market price. This added to an already feverish market a wild clamor for coal.

About this time there was started considerable agitation against both the producer and jobber because of the high price. The agitators claimed that coal was being held at various railroad terminals throughout the country, in order to bull the market. This in realty was caused by railroad congestion and was not the fault of the coal men, but a result of conditions. Summing up the situation that prevailed at the end of January, we conclude:

1. The shortage of coal had become national—no city nor state was exempt from the scarcity. Should there be a surplus in one territory, the demand in some other section of the country would immediately absorb it and cause a movement to a more distant market, unheard of heretofore, and the regular market of this territory would be shut off until such a time as it was in distressing need itself.

2. The visible supply of coal had been exhausted. The steady increase in consumption over production had completely wiped out all storage stocks, and consumers were dependent entirely on open market offerings.

This caused purchasers to bid against their competitors in open market for coal to supply their trade or keep their plants in operation. This resulted in a price of $4 per ton in many instances on Illinois and Indiana coal, that in the same month of former years scarcely ever exceeded $2.

3. To increase the fuel supply had now become a national ambition. This resulted in the coal people, railroad companies and all public agencies bending every effort to increase coal production, move cars faster, and unload and return equipment more promptly.

About this time it began to dawn on every one that prosperity was not temporary, and that the expansion spirit of the American people had come to stay. Admitting that the war abroad had, in a measure, reflected on the American trade expansion, there was a noticeable tendency, at every turn, toward home expansion.

February: With cold weather prevailing, the demand for coal had established a price, which was no recession from that which had prevailed during the first month of the year. With the season approaching when warmer weather was naturally expected and when prices were accustomed to take a tumble, the drift of the market was the reverse, and was only held in check by the influence of the deep thinkers among the coal men, who contended that prices were sufficiently high, and must not be allowed to get beyond control, as this would eventually result in what happened later—the Government fixing the prices. At this time the contract price had been strengthened by the danger of war, the realization of the need of large tonnages to replenish depleted stocks, and the constantly increasing current needs. At this time the constant strain that had been on the various coal-carrying railroads began to show perceptibly. It resulted in badly delayed shipments and congested yards everywhere, hence cars that ordinarily made a trip in 30 days, were now in transit double that time. The shortage of Eastern coal was at no time prior to February so marked as during this month; in fact, the trade had become reconciled to the belief that if it got coal of any character, it would have to be from the Western field. This increased an already heavy burden on the coal-producing West as well as the Western coal roads.

Fluctuating Market During March

March: The market was up and down during the month of March. The occasion for a price slump was a more efficient car supply during the first two weeks, and warmer weather. The news that put the market up was that the railroad brotherhood was likely to declare a strike at any time, and the market moved back to the price that had prevailed in the earlier months.

The month as a whole was one of excitement to the coal trade. That cars had become more abundant after several months of shortage, seemed to the coal men as only temporary. However cars continued plentiful for several days. The coal men had been saying all along, "Give them cars, and price would regulate itself." This prophecy had almost been realized, when the threatened strike drove prices again upward. The threat of the total absence of cars was much worse than a mere shortage, hence prices drifted quickly to higher levels.

April: America entered the world war. It was a noticeable fact that the coal industry lost heavily of its labor during the first two years of the war abroad, not only on account of immigration to America being stopped, but by the return to their native countries of a large number of coal miners. The absence of immigration and the increased production of all classes of commodities had shortened materially all classes of labor; particularly had this affected the mining industry in the Middle West.

At this stage of industrial activity the miners became restless, and asked for an increase in their wage agreement made Apr. 1, 1916, which did not expire until Apr. 1, 1918. A new wage agreement was made that became effective Apr. 16, which gave the miners an advance of 10c. per ton for pick mining—day labor, monthly men and all other classes of labor 60c. per day, except trappers and boys who received less than $1.57 per day. These were advanced to $1.90 per day. This agreement established a precedent, which later resulted in another substantial advance.

The Industry Begins to Mark Time

During the first half of April the price of coal had in most centers been circularized for the month at $3.25 per ton at the mine for prepared sizes, fine coal ranging around $3. This was an unusually high level for Illinois and Indiana coal at this season of the year. Contract negotiations had been at a standstill, no one seemed willing to accept the responsibility of making a contract that would later result in further negotiations with customers, and everyone seemed to be content to delay making contracts until all wage disputes were settled. The fact that there was a ready market for free coal seemed to warrant an indifference among the coal men about new obligations; thus, fewer contracts were made during this month than any previous April within recollection.

May: Early in May the Federal Trade Commission, headed by Chairman Harris, shifted its inquiry—which was started in Washington—to Chicago. Mr. Harris informed the coal men that the commission had started, under special instructions from Congress, several months before to inquire into the coal situation, but was compelled to abandon this work to look after other pressing matters. He asked the operators why prices were high, and what, in their opinion, were the future prospects, and the remedies for the then existing situation. During this time prices on all grades had advanced from $3.25 to $3.75 per ton for Illinois and Indiana, with a wild and unruly market prevailing. Large corporations had purchased some large producing mines; various railroads that had in former years purchased their fuel from other fields were seeking coal in large quantities. This, no doubt, reflected to a great extent on the general market conditions.

When war was declared it was realized that one of the first and prime considerations for the successful carrying on of hostilities was coal; therefore, it became necessary for the Government to have someone that was familiar with this industry to look after its interest, and F. S. Peabody of Chicago was appointed head of the sub-committee of the Council of National Defense in charge of coal, with the privilege of selecting his own committee. It was the understanding of most coal operators that this body was to be charged

with the responsibility of expediting production, arranging, and if possible, simplifying the distribution of coal for both the Government and commercial use. This committee's work was broad and efficient, and the members continued their activities until the appointment of Fuel Administrator Garfield.

June: The price for prepared sizes settled at $3.50 per ton, with fine coal ranging 50c. lower. This indicated that the minimum for the year had been reached. June in normal years is a time used to repair mines and get properties in shape for the fall and winter campaign. Not so this year; urgent demands compelled most operators to make but few changes, and to continue the operation of their plants to the limit.

Public price agitation was now at its height. This resulted in the calling by Chairman Peabody of the Committee on Coal Production, of nearly 500 coal operators, to Washington, to discuss the seriousness of the situation and see what might be done to prevent coal from soaring to unreasonable figures during the fall and winter months.

At an open session Secretary of the Interior Franklin K. Lane, Secretary of the Navy Josephus Daniels, and J. E. Fort of the Federal Trade Commission, explained to the coal operators the fundamental necessity of coal in winning the war and appealed to them for an established reasonable price. The result of the meeting was a tentative agreement between the operators and the Government, fixing the price of bituminous coal at $3.50 per ton at the mines. After the meeting had concluded, operators hurried back to their home, thinking that matters were settled for a while at least, only to learn that Secretary Baker thought the prices exorbitant. Thus, it will be seen the end was not yet in sight, and the solution for the big basic problem had not yet been obtained.

July: Little occurred during this month out of the ordinary. Prices remained as fixed by the Washington agreement, with operators running their mines to capacity when there was equipment available. Most of them had enough orders ahead to keep them going for an indefinite period, and were putting forth their best efforts to increase production and supply the demand; in other words, they sought to show by their action that they were trying to make good the promise made at the Washington conference. Even in July cars were still scarce with the exception of those mines loading railroad fuel, with a guarantee of a full car supply. Some signs of domestic buying for storing purposes had manifested themselves.

Strong Movement to Lower Prices

In the meantime, various public agencies were busy, trying to beat down prices, but the demand for steam coal was so great that little headway was made. Beginning July 21, the operators of Illinois were for almost a week in conference with the State Council of Defense; under ordinary circumstances, a meeting of coal operators with a local committee of one state would not be considered of much importance, but in this case a national issue had been raised, which had to do with the price of coal made by the Federal Government, through its agencies. The situation produced nothing but confusion and the conference finally adjourned.

August: The market continued to be strong with prices steady. The passing of the Lever Food Bill by both branches of Congress and becoming a law by the signature of President Wilson, made the President the coal autocrat. The bill in question gave the President power to control food, feed and fuel, and to fix the price of coal whenever and wherever sold.

Naturally all coal operators were much interested to know how the President would view the coal problem, and some of the operators even predicted that in view of the action of various state councils, the President would soon after the passage of this bill, "show his hand."

Lowered Prices Discourage Operators

On Aug. 21, President Wilson announced prices for bituminous coal in the various producing districts. For Illinois and Indiana, the price of prepared sizes was fixed $2.20 per ton; mine-run $1.95 per ton; screenings $1.70; all at pit mouth. Although the operators accepted the decision with apparent good grace, it was noticeable that they were discouraged and disheartened. In some instances there were exceptions made and claims formulated, showing that coal could not be produced, prepared properly, and sold at the above prices, so as to give the owners any profit. Operators everywhere began the preparation of cost data to present to the Government, showing precisely what they were doing, and what it was actually costing them to do business. Following the price proclamation, Dr. H. A. Garfield was appointed Fuel Administrator by the President, with full power to act in accordance with the power granted under the Lever Law. With this appointment, the status of the Peabody committee would seem to be at an end; however, Mr. Peabody stuck for some time and rendered valuable service to Fuel Administrator Garfield.

September: The price having been fixed, there was nothing left for operators to do except produce coal, whether in so doing they made a profit or sustained a loss. Regardless of their sore disappointment, association secretaries were busily engaged with their membership, trying to have each operator prepare and present to Dr. Garfield accurate cost data, in order to show they were warrantably entitled to more money.

Cars continued to be scarce on all coal-carrying lines in the Middle West sections, with each mine operation loaded down with orders, and customers urging shipment, fearing that the price would be raised before they could get coal. Little or no headway was made on the market, and September closed, with an increased feeling that the public was face to face with a coal famine.

October: Coal miners having worked almost six months since they received an advance, had become restless, and were, in many localities, refusing to work. This discontent spread so rapidly that production fell off and appeals to many miners for patriotism had little effect; they claimed that the advance in the cost of living was far in excess of their April increase, and requested another conference with the operators. This was arranged and held in Washington, resulting in another and a more substantial increase than the one granted in April. The wage agreement was based on the premise that the operators were to be allowed an advance by the Government. On Oct. 29, President

Wilson issued his second price proclamation, granting the operators an increase of 45c. per ton, and fixing the maximum for Illinois and Indiana coal at $2.65 for the prepared sizes, $2.40 for mine-run, and $2.15 for screenings, allowing the jobbers 15c. per ton over and above the operator's price. Based on the agreement previously made between the operators and miners, the miners' wage advance became effective Nov. 1.

November: As a result of the wage advance made to the miners, many operators who had made contracts in April, 1916, for a period of two years, were sorely affected because of their failure to properly protect themselves with a clause in their contracts that would permit them to advance their price to their customers. On this account, prolonged and lengthy negotiations were necessary. In some cases, price contracts have been adjusted with a compromise agreement, others are still pending. During the month of October, when discord and discontent among the miners were at their height, the production of bituminous coal fell to the lowest point it had reached, with one exception, for 12 months. The effect of the agreement, however, was soon felt, and production gradually rose until in the third week of November, it had again reached high.

December: The advent of severe winter weather saw the absolute collapse of the railroads—a contingency that the operators had steadily maintained would materialize. Before the month was half gone, with zero weather prevailing, and snow drifted from 3 to 5 ft. deep in the coal field, it was apparent to the best informed that the Government would soon be compelled to take immediate steps to remedy the situation.

While summarizing the past year in a few words, we cannot but wonder what the future has in store.

Mines in every locality worked every day that they could get cars and the miners would work—they were never without orders ahead to protect their operations with immediate disposition of their product, for from 30 to 90 days; two wage agreements were made at a period when there was supposed to be no changes; the Government is absolutely in control of prices, and may eventually operate the mines; a National Coal Association has been organized and is in good working order; we have now a National Jobbers Association, as well as retail dealers working together, and a fuel shortage unheard of heretofore.

"Where do we go from here, boys, where do we go from here?'

Colorado's Forecast for 1918

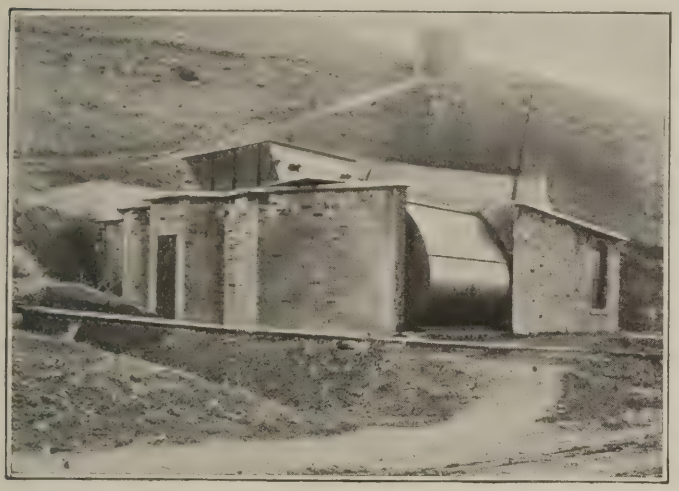
By F. W. WHITESIDE
Chief Engineer, Victor-American Fuel Co., Denver, Colo.

THE books of the year 1917 have just been closed, and we are now laying upon the trestleboard our designs of the fabric of the new year. The hovering war cloud dims our perceptions and curbs our usual confidence in our ability to do and to overcome. We know that in this war we must succeed, but by what means or in what manner this victory will be consummated we cannot with accuracy foresee.

We know that to win the victory at least four great commodities will be required—food, clothing, steel and coal; and not the least of these is coal, for each of the others is greatly dependent upon it. From this humble substance we must not only obtain heat to prepare our food; manufacture our steel; propel our transports; but from it we must also obtain material for the manufacture of explosives; drugs and medicines for our hospitals; dyestuffs for our clothing, and paints, oils and preservatives to cover and protect our products of wood and steel.

Colorado's production of coal in 1917 was 12,433,129 tons, or 1,910,944 tons greater than that of the year 1916. In 1916 the average number of days worked was 175.8 and the average number of men employed 12,598. In 1917 the average number of days worked was 204.5 and the average number of men employed 13,570.

Many of our miners and men about the mines have joined the Government service in one capacity or another. As the demand for coal will be far greater during the coming year than ever before, the operator will therefore be confronted with the problem of delivering more fuel with fewer men and a greater shortage of railroad cars. Probably the car situation will be helped by systematic Government regulation and control, but the man problem affords but one method of solution, and that solution will be reached by the installation of additional machinery for the mining and loading of coal. That this is being done throughout the state is proved by the difficulty in obtaining mining machinery of all kinds.



Whenever possible the mining machine is being introduced. In the northern, or lignite, field, practically all the coal is top cut, bottom cut or rib sheared with some type of punching machine. In the various other districts of bituminous and sub-bituminous coals the chain machine is now in greater demand and more widespread use than ever before. While hand mining and shooting from the solid is still carried on in some of the smaller properties, the practice of both is discouraged and is falling rapidly into disuse. A great

A COLORADO MINER'S COTTAGE

deal more attention to efficient methods of gathering, hauling, dumping and screening the coal is given in order that each man's efforts will be productive of maximum results.

The first bank of byproduct coke ovens designed to furnish smelter or steel coke to be installed in Colorado are now in course of construction by the Colorado Fuel and Iron Co. at its steel plant at Pueblo. One hundred and twenty ovens capable of carbonizing 2200 tons will

TYPE OF FAN ERECTED BY VICTOR-AMERICAN FUEL CO. NEAR TRINIDAD, COLO.
The fan shown is a 90 x 90-in. Sirocco

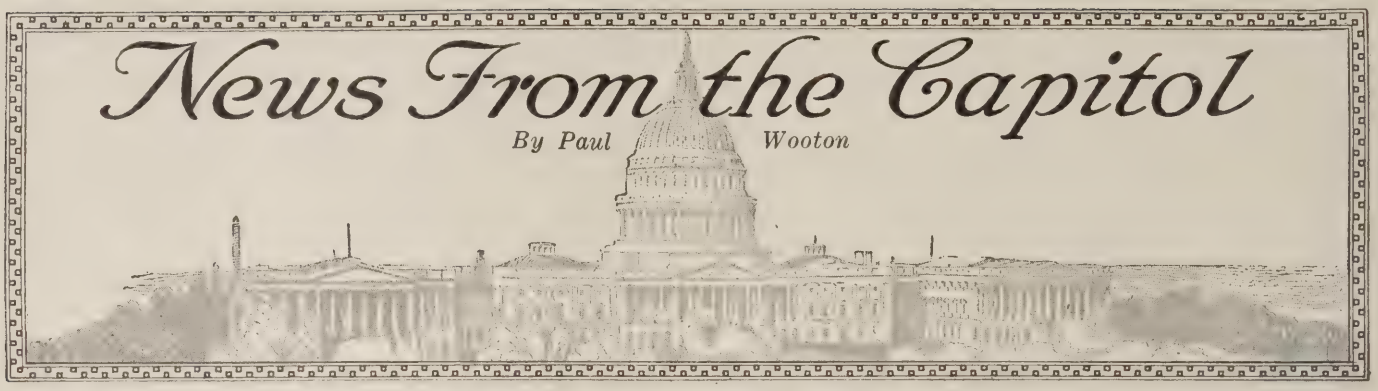
be ready for service about Mar. 1 of this year. From these will be derived gas for the steel plant, and among the first of the byproducts to be obtained will be tar, ammonia, benzol and toluol. To charge these ovens a washery with a daily capacity of 3000 tons is building near-by. Both the ovens and the washery are so designed and constructed that duplicate plants can be added to each. Slack for the combined plant will be hauled from Trinidad, 100 miles distant.

The Victor-American Fuel Co. is preparing to install at one of its mines a rotary dump with a capacity of dumping 12 pit cars simultaneously. This operation is expected to eliminate much of the expense of dumping and screening coal at the tipple. A 700-ft. rock tunnel has recently been completed and the grading of the 2800-ft. gravity tramline, which will handle the pit cars from the tunnel to the tipple, is now in progress.

The Victor American company has recently completed an 850-ft. tramline bridge across the Yampa River to its new tipple at Wadge mine in Routt County.

Workman's compensation has greatly assisted the state coal-mining inspector and his deputies in the work of inspection and making safe the coal properties. Comparatively little difficulty is experienced in getting the men to work steadily. Due to the car shortage, a large per cent. of the mines are unable to work six days a week, even though the men are so inclined. In one district especially the car shortage has been so great that a week sometimes goes by without the mines turning a wheel.

It is difficult to state what effect, if any, Government regulation has had, as it has not been in effect long enough to receive a thorough tryout. The first noticeable effect was when the probability of Federal regulation was announced; many dealers and consumers thinking that the price would be very appreciably reduced, postponed turning in their orders with the result that when the matter was finally settled the operators were able to handle but a small percentage of the business, so great was the demand for coal.



The outlook for 1918 is problematical. There is every possible reason to expect the greatest demand in the history of the coal industry. There are abundant grounds for the belief that the average daily tonnage per man can and will be increased by the installation of labor-saving machinery.

There remains the railroad transportation situation with which all industries, as well as that of coal, must reckon. Colorado has no navigable waterways. She is

COLORADO MINE TIPPLE IN THE MAKING
This tipple is being erected near Canon City, Colo.

entirely dependent upon some form of land transportation. Our Uncle Sam will, without doubt, work wonders in the solution of our present and future transportation difficulties. But even the great things he has done, which he is now doing, and which in the future he proposes to do, require time; and the most significant feature about our present solution is that to accomplish the desired result whatever is done must be done quickly. The entire country is short of power and railroad equipment. If our worthy Uncle can with his mighty arm relieve this unfortunate situation, Colorado pledges herself to break all her previous records for the mining of coal.

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Metropolitan Bank Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 703, Metropolitan Bank Building, Washington, D. C., while at the capital.—Editor.]

Peabody Testifies Before Senate Investigating Committee

Division of the country into producing and consuming zones; cleaning coal; a definite price schedule to extend during the war and six months thereafter, and a restriction of priority orders were the four points outlined by Francis S. Peabody on Jan. 14, before the Senate Investigating Committee, as being the most necessary steps to be taken to improve the coal situation. Members of the committee regard Mr. Peabody's testimony as having been of exceptional value. Throughout his presence on the stand he was accorded the closest attention by the members of the committee and by the audience.

In reply to direct questions, Mr. Peabody stated that he was not consulted by the Fuel Administration when it took over many of the functions which his committee on coal production was attempting to perform. Despite Mr. Peabody's offer to assist the Fuel Administration he was not consulted on matters of moment. Mr. Peabody stated that he had nothing at all to do with the conferences which resulted in the adoption of the schedule which received the approval of the President. As an incident to the questioning in this regard, Mr. Peabody stated that he would expect under present conditions to receive cost plus 15c. per ton for coal taken from his mines.

A zone system following the English plan is perfectly feasible in this country, Mr. Peabody told the committee. He stated that he had given this problem considerable thought and had consulted with transportation experts and with experienced coal men. Such a plan, he declared, will increase the country's output of coal by 20 per cent. The plan divides the country into 30 districts. No coal is to be sent out of one zone into another without a license from the Fuel Administration, according to the Peabody plan. This license will have to be resorted to in some instances, Mr. Peabody pointed out, using as an example the necessity of having a good coking coal at byproduct ovens.

The necessity of clean coal was emphasized strongly by Mr. Peabody. Next to the zoning of the country, he regarded it as being most important. A statement compiled by the Bureau of Mines was introduced into the record which showed that, in some cases, coal now being shipped contains as much as 37 per cent. ash. A long list of analyses brought out clearly that there had been a very large increase in the amount of refuse being shipped in coal. Mr. Peabody called attention to the tens of thousands of cars which are being used in this time of stress to transport entirely worthless material, to say nothing of the losses to the consumers. So great is the quantity of refuse that is being shipped with coal that Mr. Peabody believes it will more than offset any increased tonnage which may have been shown since September.

Third in the point of importance Mr. Peabody placed the necessity for a definite statement from the Government as to the length of time the price schedule will be maintained. That prices should be subject to change without notice, as they are at present, Mr. Peabody asserted to be a "death blow" to production. With the existing uncertainties as to price and to contracts, there is such hesitancy on the part of capital to improve existing mines and to open new ones as to constitute an element of the gravest danger in the situation, he said. If the price schedule should be made permanent for the period of the war and six months thereafter, and allowance be made for any increase in wages, great stimulus would be given coal production. Mr. Peabody declared that he was very well satisfied personally with the Government's prices, but that any price schedule to be entirely fair should be based on the thickness of the seam.

Several times, when questions were asked, which seemed to imply a criticism of the Fuel Administration, Mr. Peabody would bring out his opinion that little good could come from criticism. He expressed his conviction that this is the time for constructive suggestion, rather than a consideration of that which has "gone over the dam." Pressed by the Senators, however, Mr. Peabody stated that the necessity of cleaning coal had been brought by him to the attention of the Fuel Administration shortly after it began work, but that no action was taken and that he rarely received any replies to his communications other than an acknowledgment of the receipt of his letter. The ruling

with regard to new mines also was criticized as was the effort to go into intricate cost accounting when the country is at war. He advocated the use of the broad ax and the tearing away from the detail and red tape which is hampering production and distribution.

The use of the priority order in a way which will do justice to all, Mr. Peabody thinks, can be brought about only by its application after it has been passed upon by expert railroad men and by those who would be familiar with every ramification of its influence. The too frequent and ofttimes short-sighted use of priority orders has been one of the most disturbing elements of the present situation, it was brought out in Mr. Peabody's testimony.

Mr. Peabody expressed his disapproval of the pooling plan authorized by the Federal Trade Commission. He said that he and Mr. Colver had argued in support of their respective views in this regard for two months, but that Mr. Colver was unable to answer his question as to what he would do when supply caught up with demand and the pool began to overflow.

Mr. Peabody criticized the inequalities of prices in the Northwest and stated that this section of the country is being allowed to drain Illinois and Indiana of coal.

Franklin K. Lane, the Secretary of the Interior, also appeared before the committee. His testimony was confined largely to an explanation of his participation in the adoption of the Peabody schedule. He defended the action taken by the operators at that time but did not take advantage of an opportunity offered him by Senator Lodge to criticize the action of Secretary of War Baker in undoing the operator's action by making public a letter criticizing the schedule. Secretary Baker's letter, however, was introduced into the record.

Weekly Production Statistics

Coal production during the week ended Jan. 5 exceeded all expectations when 9,236,000 tons was mined. This is an increase of 3.6 per cent. over the production of the preceding week. Beehive coke to the extent of 515,000 tons was produced during the week ended Jan. 5. Forwardings of anthracite coal were 27,517 cars, as compared with 36,083 cars during the preceding week. The anthracite production for 1917 is estimated as having been 77,133,305 tons, as compared with a total production of 67,376,364 tons, which made 1917 the banner year in the history of the anthracite industry.

Observance of holidays during Christmas week made labor shortage a much more prominent limiting factor in coal production than has been the case in many weeks. Reports to the Geological Survey show that labor shortage and strikes were responsible for loss of production to the extent of 10.2 per cent. This compares with 2.6 per cent. for the week ended Dec. 22. During the week ended Dec. 29, the losses from car shortage fell from 24.7 per cent. to 8.8 per cent. As fewer miners were at work during that week, the railroads had less difficulty in supplying the needed cars.

Commenting on the general situation, during Christmas week, the report says:

> From all states except southwest Virginia, Alabama, Iowa, Arkansas and West Virginia Panhandle improved working conditions were reported. In each of these states an increase in losses due to labor shortage was responsible for the decline in output. In southwestern Virginia and Alabama the ratio of tonnage produced to capacity was the lowest on record since the weekly bulletins were begun; losses attributed to labor shortage in southwest Virginia were 24.1 per cent. and in Alabama 23.6 per cent.
>
> A general improvement in working conditions was reported from Illinois, Indiana, Ohio and Pennsylvania. West Virginia, both high- and low-volatile, which had suffered from the bad weather longer than other districts, showed a marked improvement during Christmas week. The most striking improvement was reported from eastern Kentucky. Losses in the Hazard field dropped from 63.1 to 19.3 per cent. of the full-time capacity; and in northeastern Kentucky from 62.5 to 32.0 per cent.

Convinced that its weekly statistics on coal, coke and anthracite production are helpful to the industry, the Geological Survey has extended its work to include byproduct coke. These figures as well will be compiled by C. E. Lesher, the geologist in charge of coal statistics. The first report, which covers "a seven-day period in late December," shows production to have been 384,207 tons, which is found to have been 80.4 per cent. of the full-time capacity of the country's ovens. Practically all the loss was due to inability to obtain coal.

Fuel Shortage in the United States Not Due to Exports

During the first eleven months of 1917 the United States exported 19,647,671 tons of bituminous coal. This compares with 17,740,391 tons during the corresponding period of 1916. These figures, which are compiled from the official returns to the Department of Commerce, set at rest the widely circulated report that an important factor in the fuel shortage in the United States this winter is due to increased exports. The greater part of the coal exported went to Canada, which country received from us 14,912,698 tons. The report had it that specially large quantities had gone to Italy. This is not the case, as the forwardings to that country for the entire eleven months were only 553,423 tons. This is one-third of the exports during the same period of 1916. Exports of coke, as well, showed no important increases during 1917 over those of the preceding year.

Exports of coal during 1918 probably will be somewhat less than were those of the year just closed, as the War Trade Board expects to be very strict in the application of its power to grant licenses for coal. It is admitted, however, that exports to Canada, which constitute the bulk of this country's forwardings, cannot be curtailed greatly.

United States Fuel Administration Now Has Control of Oil Matters

United States Fuel Administrator Harry A. Garfield on Jan. 10 announced the appointment of M. L. Requa, of California, to handle oil matters for the United States Fuel Administration. Mr. Requa will have full charge of the activities of the Fuel Administration in connection with oil under the direction of Fuel Administrator Garfield.

Since the organization of the United States Food Administration, Mr. Requa has been an assistant to Food Administrator Herbert Hoover. His transfer has

been arranged with Mr. Hoover, who has consented to the change because of Mr. Requa's qualifications for his new position. Mr. Requa leaves the Food Administration only because it is believed his services are of more value to the Government in connection with oil.

Mr. Requa is a consulting engineer to the Bureau of Mines on Petroleum; is vice president of the American Institute of Mining Engineers, and is a member of the Council of the Mining and Metallurgical Society of America. He has been connected at various times with the oil industry in California.

The first activity of the new Oil Division of the Fuel Administration will be to undertake an investigation of the entire petroleum situation and to recommend to Dr. Garfield such action as may be necessary to handle petroleum matters.

Three More District Representatives Appointed by Garfield

Additional district representatives have been announced as follows by the Fuel Administration: W. B. McKinney, Columbus, Ohio, for the Crooksville, Hocking, Jackson, Pomeroy and Ironton coal fields of southern Ohio and in Mason County, West Virginia; C. G. Hall, Terre Haute, Ind., for all the Indiana coal fields; E. A. Holmes, Birmingham, Ala., the Alabama coal fields. Accompanying this announcement was the following, from the Fuel Administration: "Inadvertently district representatives in the mine fields have heretofore been called deputy distributors. Please note the change in designation."

No Radical Steps Contemplated as Regards Distribution of Coal

A manager of coal distribution to have direct supervision over the representatives of the Fuel Administration in the various producing districts will be named by the Fuel Administrator in the near future. It is known that every effort is being made to secure for this highly important place the most capable coal operator available. This step is being taken as a part of the reorganization of the distribution portion of the Fuel Administration. Officials at the Fuel Administration are complimentary in their references to the help they are receiving from the operators in the decentralization of distribution. There is much controversy over details, but a plan which, it is believed, will be generally acceptable is being worked out. Many are confused by the idea that a zone will be laid out which will limit the markets for coal. The plan under consideration does not, in itself, contemplate such action. The idea is to get the machinery set up and to appoint representatives in the different districts and then decide if it is advisable to limit markets. Before Pocahontas coal is cut off from Illinois and Indiana or eastern Kentucky coal from Michigan, or Kanawha coal cut off from New England the Fuel Administration expects to be sure that such a step is for the best. It can be stated on the best of authority that no radical step in the matter of distribution is contemplated.

Government Calls for Heavy Machines

We are asked to transmit to our readers the fact that the United States Government is in immediate need of large machine tools—60 x 60 x 20-ft., 48 x 48 x 20-ft. and 36 x 36 x 14-ft. planing machines, Nos. 4 and 5 plain milling machines and vertical milling machines of like number, 30 in. by 20 ft. and 36 in. by 20 ft. engine lathes, 4-ft. and 5-ft. radial drilling machines, 10-ft. and 5-ft. vertical boring mills; 6-in. floor type, horizontal boring and milling machines and 4-in. milling machines of the same type.

It is hardly likely that ordinary coal-mine shops have these large tools, but many of the coal-mining officials have friends and acquaintances to whom they can make this imperative need of the Government known. Those who can supply these machines should write or wire at once to the Machine Tool Section of the War Industries Board, Council of National Defense, Washington, D. C.

Brief Washington Notes

Chicago consumers have been able to make such a good case that the Fuel Administrator has issued orders to operators in the Pocahontas field which will result in a considerable movement of low volatile coal to the Illinois metropolis.

With authority to divert shipments of coal from the original consignees, the Fuel Administrator has appointed a number of representatives of the Fuel Administration to coöperate with the railroad authorities in clearing up congestion. This step was taken at the request of the Director General of Railways.

P. B. Noyes, who is in charge of the conservation division of the Fuel Administration, has been sent to New York to coöperate with Albert H. Wiggin, the State Fuel Administrator, in the curtailment of coal supply to certain classes of consumers. This action has been made necessary by congested terminals and transfers in the vicinity of New York.

Coal supply in Ohio and Michigan is such that on Jan. 12 the Fuel Administration instructed operators in a number of districts to ship all coal possible to these states. The districts affected by the order are Pittsburgh, Fairmont, Kanawha, Kenova, Thacker, eastern Kentucky, Jellico and Ohio. The operators were asked to suspend shipments to other points for ten days in order to divert into the states mentioned as large volume of coal as possible.

No fuel of any sort is to be used between 7 a.m. Saturday and 7 a.m. Monday of each week by manufacturers engaged in the making of box board, paper board, straw board, binder board, tag board and other boards made from waste paper or rags. An order to this effect has been issued by the Fuel Administrator after a majority of the manufacturers engaged in the making of these articles agreed to abide by it. This limitation will result in a saving of 780,000 tons of coal per year.

EDITORIALS

Delays in Postal Deliveries

"BETTER late than never," seems to have been adopted as a maxim by the Post-Office Department in the delivery of mail of all classes. When we pause for a moment to consider that train schedules have been curtailed, that thousands of postal clerks are now in military service, that severe weather has caused numerous tie-ups—we can readily see why copies of *Coal Age* are slow in reaching our subscribers. We have received many complaints on this score. Taking up the matter with the postal authorities, we were assured that every effort is being made to bring the service back to normal.

Coal Age itself is also suffering considerable inconvenience from the breakdown of the postal service. Articles which were mailed "special delivery," and in ample time to reach us for this annual review number, have not yet been received, necessitating the procuring of much data by means of the telegraph.

Patriotism demands that we exercise a little patience at the present time in matters such as these. The necessary readjustments in service will soon be made, and new clerks are being trained to take the places of the men who have enlisted. We are helping all we can to deliver the paper on time.

To Every District Its Troubles

IF THE coal industry had but one head, that the public might behead it; if it had but one district with uniform conditions, so that the public might know just what those conditions were and who was to blame, all might be well. But, as it is, we are faced with an infinite complexity.

There is the anthracite region—with a sufficiency or nearly a sufficiency of cars—working steadily and unable to supply demands because of shortage of mines and miners. There is the generality of bituminous mines, desperately short of cars, run infrequently, with enough miners to supply the demand if they were all working steadily or even if they were operating with a little more steadiness than at present.

But no one would believe that here in America was a field with too many mines, too many cars and too many men, looking for orders for the coal it is producing. Yet there is such a field, in witness of which read this letter from D. S. Hanley, general manager of the Carbon Coal and Clay Co., Bayne, Wash., under date Dec. 21, 1917:

> In view of the serious coal situation that must exist in the East according to press reports and the articles appearing in your publication, it would be interesting to you to know that in the State of Washington there are several mines, particularly those located west of the Cascade Mountains, that are suffering acutely from lack of business.
>
> The mine of the Carbon Coal and Clay Co., with a capacity of approximately 10,000 tons per month, has been able to run but two or three days per week since the latter part of November because there has been no demand for its product. This condition is not peculiar to us, for other mines in this vicinity have been similarly affected.
>
> The question has been taken up with the Federal fuel administrator for this state, and I think he is doing everything possible to urge the industrial and domestic consumers to take advantage of the present lull in the market by stocking coal. He has also discussed the question with the Federal fuel administrators of adjoining states, where a coal shortage exists, suggesting that they take advantage of our capacity to supply coal, but so far there have been no definite results.
>
> I think it can safely be stated that the mines referred to west of the Cascade Mountains can, if they have the market, produce and ship from 40,000 to 50,000 tons of coal per month more than they are now producing and shipping. The railroads have been doing good work in the matter of furnishing empty equipment, and even when the demand for coal was good there were but two or three days when the production of the mines was curtailed for lack of cars.
>
> Apparently in eastern Washington and northern Idaho a preference is shown for the Wyoming and Utah coals. But it is now expected that the Government will compel the people of the state to use the coal of the west Washington mines, the coal of Utah and Wyoming being diverted to Montana and Oregon, thus keeping everybody at work and shortening railroad hauls.
>
> Some of the coal of King County is rated as sub-bituminous. The moisture content of the field varies considerably, but sometimes exceeds 16 per cent. The ash also is occasionally quite high. The Bayne mine, from what we can learn, has a far better analysis both as to moisture and ash than many of the King County operations, and it is rated as bituminous coal. But whatever the coal is, without doubt Tacoma and Seattle should seek its supplies from the mines in the King County field because it is near-by. Seattle itself is located in that county, and Tacoma is just barely outside its line. In these days of the need for short hauls the King County field should be given every consideration.

Cutting Our Suit To Fit the Cloth

SO far we, as a nation, have been principally busy in this war making requisitions like some young superintendent just on the job. We have figured on all we wanted without forming a real budget. We added the totals, it is true. They looked alarming, but we did not let it trouble us seriously. It was unpatriotic to question whether we could raise the money or secure the workers or find the material.

There was no head to direct and no brain to steer this big business proposition. But after all war is a business, a big business, and something more than enthusiasm is needed. We cannot requisition without limit, and so we must be careful to evaluate our abilities and our needs, being prepared to spend liberally on what we need most and to be niggardly in spending even nationally—and certainly personally—in those things that we need but little.

As it is, every one who has a department that can aid in the war looks toward getting the utmost expan-

sion of that department in the least possible time. There is no limit but the sky. Suppose a mining operation had a superintendent of motive power who had a morbid fear of being found with a shortage of locomotives and cars and, on the other hand, had an utter indifference to the possibility that it might be found that he had bought more equipment than the mine would ever accommodate or the men would ever be found to need.

Suppose, at the same mine, we had a power-house superintendent who ordered so generously that he could never by any eventuality be called upon later to enlarge his plant, and so on. If then there were only these energies for disbursement and no energies provided for control, there would be no limit to the purchasing till the property went into the hands of the sheriff. The analogy to the conduct of our affairs in the present war is obvious and need not be pointed out.

Our net income has been about $2,000,000,000; probably we can raise it by economy to $15,000,000,000 and later perhaps to $20,000,000,000. Of course, out of this we have to make some loans. Let us keep them down to the irreducible minimum. The less we lend to the British and French, the more we have to spend on ourselves. The money we lend to foreign governments we make them pay interest on. For what we spend on our own preparation, we collect neither principal nor usury. We put both capital and interest into the war without charge to the Allies.

Our loans are not matters to be boastful of. It is to be regretted that we have to put our tools into the hands of other people that they may do the work that we, ourselves, are spoiling to do and don't do solely because we, ourselves, just at present can't do it. The Allies have to borrow money and pay us interest only because we are not ready to put it into the fight ourselves. This is a thought from which we cannot draw much encouragement.

However, it is true that loans must be made and the amount we have to spend on our preparation will be by that amount diminished. Having arrived at that amount, whatever it may be, let us inquire what we want most for our own preparation. Perhaps the most vital, though not by any means the largest, of our needs is an appropriation for certain purely local improvements.

Do not let us forget that Great Britain has spent much money on herself since she went to war—building homes in and around munition centers, enlarging and modernizing terminal facilities and providing conveniences for her large training camps. And we may have to do the same. We may have to put the railroads right before we go far along with the war. Whatever must be expended to make them adequate must be provided.

That is one reason why government ownership is not so much to be regretted. It changes our viewpoint. It is no longer unpatriotic or un-Ally, if we may coin a word, to spend money on the railroads. One, without being labeled pacifist and profiteer, can now venture boldly to say out loud that expenditures on railroads with a view to military and proper civilian needs during the war are more important than expenditure on munitions.

The shipping question is also a paramount problem not to be shelved for anything which is less important even if more distinctively warlike. Then comes the army, the aviation service and the mosquito fleet in the navy. The United States Navy has proved one of the departments of which we have most to be proud. But there is a risk that we shall lay too much stress upon it. We are quite likely not to follow the lead of our Allies who regard the increase in the number of large units in the navy as of inferior importance to the increase of the mercantile marine.

We need a level-headed man to lead in the war preparation. We do not want every man to think that if his department is extended to the beggaring of other departments the war will be won. There must be no crowding for first place. Rather there must be coördination. Sometimes a man advances his own interests and the interests of others best when he doesn't try to do it all himself or to put the interests of his own work first, but pats his neighbor on the back and gives him encouragement.

The Order Shutting Down Industries

IT IS probable that the Jan. 16 order of the Fuel Administrator, shutting down business for five days and closing up industries on every Monday until Mar. 25, is not only the most drastic, but the most arbitrary ruling ever issued by any authority in the United States. If it were not stated that this order came after a White House conference, we would feel certain of its revocation.

The pity of it all is the shame it casts upon the Nation. Here are we, a people noted for our industry and energy and having within our boundaries coal mines that this year will produce six hundred and thirty-three million tons of coal, or practically one-half the world's fuel output, yet we must do a thing that no other nation has had to do, not even Germany, shut off from the world and having suffered nearly four years of war.

It is difficult for those of us who do not know all the facts of the situation to pass judgment. However, we find it hard to agree that this ruling is a wise one. The whole question is one of transportation. The mines can produce the coal. Even today collieries in many regions are working only from one-half to three-fourths full time. Is it any wonder that the mine owners experience difficulty in keeping a sufficient supply of labor at hand when the men are obliged to be idle so many days each month!

We know now that a great deal more coal could have been hauled during recent months with the same number of cars if those in charge of the railroads had only compelled the immediate unloading and return of cars. This problem was not met in the stern manner that was necessary. It is also a fact that the Government should have exercised certain discriminations in recruiting and drafting miners. Now the entire industrial life of America is asked to pay the price for the mistakes of a few individuals.

We earnestly hope that the closing-down order of the Fuel Administrator is quickly revoked. We do not feel that such a move is necessary to relieve the present distressful situation. Nothing could be done to more greatly hearten the German people and to discourage our allies.

THE LABOR SITUATION

General Labor Review

The three great events of the week are the demand on the part of the Fuel Administrator that the mine operators in Alabama accept the scale adjustment already approved by the mine workers; the meeting of the United Mine Workers twenty-sixth consecutive and third biennial convention in Indianapolis, Ind., and the citation on June 14 of Frank J. Hayes, the president of the United Mine Workers and nine other officials of the union, to show cause why they should not be declared in contempt for violating an injunction restraining representatives from attempting to organize employees of the Hitchman Coal and Coke Co., of Wheeling, W. Va. The officials are to appear in court to answer these charges at noon, Mar. 4.

With regard to the first item it must be acknowledged that the operators will be well advised to accept the mandate of the Fuel Administration, which was not really unfair. They can battle out the question as to who are and who are not bona-fide employees of their respective companies when they apply for work. This is not the time for resisting any reasonable solution of a pressing labor problem.

As for the Hitchman case, we hope that some way may be found to quiet matters down, at least till after the war. The decision of the Supreme Court came as a great surprise. Few, indeed, expected that so severe a blow would be administered to the practices of organized labor.

The long report on the biennial conference appearing in other columns of this issue makes it unnecessary to discuss that meeting at length. Everyone will surely regret to read in the statement of President Hayes that he intends to go on with the work of progressive unionization during the war. He says: "We intend to carry on these campaigns of education and organization until every coal field in the country is thoroughly organized." He discusses the Colorado Coal Co. case against the union and says it was "a far-fetched inference" to hold that the controversy between the plaintiffs and the miners of Hartford "must have grown out of a gigantic conspiracy to interfere with the production and commerce of nonunion coal." He adds: "It was shown by the constitution of the United Mine Workers of America that the strike was outside of the jurisdiction of the international organization, its officers, and that the executive board had nothing whatever to do with it."

Mr. Hayes in his speech recommended that in the order of business of every local union the following inquiry be incorporated: "Are there any members present who desire to become citizens of the United States?" Mr. Hayes made an excellent address, showing that he is a worthy successor of the long line of competent and intelligent men who have preceded him.

On Dec. 1, 1915, the union had $120,441.63; a year later it had increased its balance to $417,018.91. On Dec. 1, 1917, the union's funds had dropped again to $209,747.55, barely 50c. per member. The income during the year has been $1,759,727.34 and the expenditures $1,966,998.70. The aid to District No. 23, western Kentucky, was $120,500. In Alabama $108,400 had been expended up to Dec. 1. To Colorado, union aid to the extent of $66,850 was extended. Both bituminous districts in Pennsylvania received aid, the central Pennsylvania district being helped to the extent of $23,000 and the western Pennsylvania district to the tune of $58,000. But the lion's share of all went to eastern Kentucky and Tennessee. That district received $252,125 in aid of its protracted strike. The income of the *Journal* for the past year was $28,143.93 and the expenditure was $66,014.40. In the two years from Dec. 1, 1915, to Dec. 1, 1917, the loss on the publication of the *Journal* was $103,253.05. There has been an improvement in the last year, but still the balance sheet is unfavorable.

There have been a few small strikes, among them being a strip-pit in Pittsburg, Kan., operated by Smith, Scott & White Co., which went on strike Jan. 4. Of course, it is not termed a strike. To so announce it would be to invoke the penalty. Men do not strike any more, they quit work nowadays.

Alabama Operators Must Accept Fuel Administration's Decision

On Jan. 12, H. A. Garfield, the Fuel Administrator, wired the Alabama Coal Operators' Association that they must accept the Fuel Administration's decision, as approved by the United Mine Workers of America in Alabama at their meeting, held Dec. 20 and 21 of last year. At this meeting 269 delegates were in attendance. They represent 97 local unions.

By practically unanimous vote they accepted the proposition which was "*recommended* to them by the Fuel Administrator and which the same administrator now *commands* the operators to accept." The attitude is quite typical of a standing which is not quite equal. Mine workers *may*, mine operators *must!*

The contract presented the mine workers by Rembrandt Peale as representing the Fuel Administration had the following provisions:

1. Recognition of right of employees to join any union, labor organization or society without discrimination in distribution of work, providing that nothing is done to disturb the relations of employer and employee by intimidation or coercion and providing that every man is allowed by the employees perfect freedom to join or to refrain from joining the union at his pleasure and providing also that no employee shall use the company's time for any other purpose than that for which he is paid nor may he "interfere with the operation of the mine or knowingly do that which will reduce the output."

2. Reëmployment upon application of all men discharged because of affiliation with the union, excluding, however, men who have made unlawful threats or committed unlawful acts, unless the employer is satisfied that the acts will not be again committed by the applicant. Disputes under this clause to be submitted to the umpire.

3. Right of employees to meet shall not be interfered with or abridged.

4. Committees of workmen, selected at meetings, called for the purpose not more frequently than once every three months, shall be received by the managers and shall be privileged to present the grievances of the employees, which shall not be waived, rejected or postponed as far as any matter is concerned covered by this agreement. If no agreement is reached with the superintendent, the grievances are to be referred to the highest official of the company available, who shall pass on the question within 10 days. If not then adjusted satisfactorily to the committee, they may appeal to the permanent umpire, whose decision shall be binding and made within 30 days. Either or both parties may present their case by duly authorized representatives. The mine committee shall consist of three mine workers from each mine, selected by the employees at the mine after written notice, stating the place and time of meeting, has been posted at the tipple or tipples at least three days prior to the date of such meeting and before any later election meeting.

5. Mine committees shall only attempt to adjust disputes which the miner or miners affected have endeavored to adjust without success. These grievances shall not be discussed during working hours. All parties involved must continue at work while the investigation and adjustment are being made. Only rules and regulations in conflict with those in this contract shall be changed by this agreement.

6. A checkweighman selected as required by law from among the mine workers employed at the mine may be placed on each tipple at the expense of the miners. His duties shall be those prescribed by the state law. If a suitable man cannot be found, an outsider may be employed with the mutual consent of the operator and miners. An election shall be held at the mouth of the mine or tipple after three days' notice, posted at the mouth of the mine or tipple, which elections shall be free from the interference of the company's officers or agents. The operator at each mine, when so requested by a majority of the mine workers, shall collect the wages of the checkweighman in such manner as is prescribed by the men so long as same is not in conflict with the laws of the state.

7. In view of the fact that a large proportion of the coal produced in Alabama is sold under contracts that do not expire until July 1, 1918, the consideration of the following matters, namely, the uniform readjustment of tonnage and yardage rates, all day labor and deadwork rates, the increase or decrease of the existing wage rates, it is agreed shall be postponed until July 1, 1918.

8. The umpire herein provided for shall be appointed by the Judge for the United States District Court for the Northern District of Alabama, from a list of six names, three of which shall be submitted by the coal operators and three by the mine workers, said appointment to be subject to review by the United States Fuel Administrator on appeal by either the mine workers or the coal operators, and the United States Fuel Administrator shall have the power to disapprove said appointment, in which event six names, which may include the names originally filed, except the one whose appointment has been rejected, shall be submitted as herein provided for in the first instance to the Federal judge, who shall make another appointment, and which appointment so made by him shall be subject to review by the United States Fuel Administrator, as herein provided.

In the event of a vacancy the Federal judge shall appoint a new umpire under the same procedure herein provided for. The umpire shall serve during the term of this understanding. The umpire so appointed shall receive suitable compensation, to be agreed upon, one-half to be paid by the coal operators and one-half by the mine workers.

9. This understanding shall be in effect and binding upon the coal operators and mine workers during the continuation of the war, and not to exceed two years from Apr. 1, 1918.

10. The semi-monthly pay day shall be established at all mines.

11. The rules of the company shall provide for a square turn in the distribution of cars. The operator, and his superintendent and his mine foreman shall be respected in the management of the mines and the direction of the working force. The authority to hire or discharge shall be vested in the mine superintendent or mine foreman.

12. The United States Fuel Administrator urges upon the operators and mine workers of Alabama that the question of the hours of labor that constitute the day's work be settled and agreed upon in the terms set forth in the operators' public statement of Dec. 6, 1917, published Dec. 10, 1917, as follows:

"The operators are willing to put in effect in Alabama, for the duration of the war, if you desire it done, the working hours now in force in the Tennessee-Kentucky field; that is, employees shall be at their working places at 7:30 a.m., and shooting time in the mines shall be 4 p.m., with not more than thirty minutes to be consumed by employees in lunch or dinner hour. Day labor necessary for the transporting and dumping of coal that may be in transit at quitting time shall continue working until such coal is loaded on railroad cars, it being understood that no more than one-half hour may be required for this work, which will be performed by the necessary day labor involved without additional compensation."

13. It is expected that a penalty provision satisfactory in its terms to the United States Fuel Administration shall become a part of your common understanding.

14. This understanding is made subject to the ratification of the coal operators of Alabama, or those who indicate their acceptance by their signatures, on the one part, and by the mine workers of Alabama on the other part, due notice of which shall be served upon the United States Fuel Administrator.

Mine Workers Convention Assembles

On Tuesday, Jan. 15, the convention of the United Mine Workers of America actually managed to meet at Indianapolis, Ind. For a while it seemed likely there would be a delay in the assembling of the delegates and that the date of the session would have to be advanced several days. But that did not prove necessary.

The committeemen, who, as a rule, have their reports practically completed two days prior to the convention, were on Sunday still somewhere en route. John L. Lewis, the vice president, and Frank Farrington, the president of the mine workers of Illinois and chairman of the constitution committee, were snowbound at Springfield, Ill., the Big Four having cancelled all schedules between Indianapolis and Illinois points.

John P. White, who came from Washington, arriving on Sunday, was 21 hours late. He announced that Harry A. Garfield, the Fuel Administrator, would be unable to be present to address the convention as planned. It was, however, pressure of business and not the snow which prevented the consummation of his promised visit. At least, the snow was not the direct cause except as it affected the pressure of his business. President Frank J. Hayes was confined to a local hotel nursing a bad case of "La Grippe."

But all these unfortunate difficulties were, fortunately, removed, and the mine workers met as planned. Patriotism was the keynote of the meeting. Governor James P. Goodrich and the representative of the Mayor of Indianapolis made speeches, as did also several labor leaders. All of them paid tribute to the mine workers for their work in meeting the demand for coal as far as opportunity permitted. The report of the credential committee was held pending the arrival of belated delegates.

Meanwhile the reports of the officers of the organization —Frank J. Hayes, president; William Green, secretary-treasurer, and John L. Lewis, vice president—were duly read, all being well received. Alex. Howat, however, is still continuing his buttonhole campaign for the defeat of the penalty clause in the Washington agreement. He has but a small following outside his own delegation.

It seems certain that the Washington agreement will be overwhelmingly ratified. No amendments will be tolerated, the stand being taken that the agreement must be ratified as negotiated or rejected entirely. The agreement cannot be amended. The opposition which might conceivably muster enough force to register a vote against some feature in the new contract could not possibly be strong enough to condemn it as a whole.

It is likely that a defense fund of 50c. per month will be levied to prepare the union for a defense of its position as soon as the war is over. There will also be, in all probability, an increased per capita tax of 50c. per month. The measure will certainly be offered for vote and will probably be carried.

It looks as if Indianapolis will unquestionably lose the convention for the year 1920. Cleveland appears the most likely place to be chosen, though Scranton and Kansas City are advocated by the delegations from the vicinity of those cities.

John Walker has not yet arrived, but his friends say he will be a rival for the position of president. Thomas Kennedy, of Hazelton, Penn., president of district No. 7, is mentioned as candidate for vice president in place of John

FRANK J. HAYES
President, United Mine Workers

JOHN J. LEWIS
Vice president, United Mine Workers

WILLIAM GREEN
Secretary-treasurer, United Mine Workers

L. Lewis. Alex Howat, who is president of district No. 14, claims that John Walker will support his policies, but Walker's friends hardly regard that prospect as likely to assist their candidate and they are declaring that Walker is a safe man who will steer clear of the rocks. Meanwhile he occupies an inconspicuous place among the delegates and awaits the scale fight.

The losses incurred in the running of the *United Mine Workers' Journal* are likely to create a hot test fight. An outsider might suggest that the *Journal* would be a better seller if it were much less radical. It misrepresents the sentiments of the average mine worker, who does not believe that the mine workers are a lot of tin angels or the operators a crowd of hoofed devils. The paper is improving. It is furnishing more news and less diatribe, but it has a past to outlive and that will take some time. No one today wants a rabidly one-sided uncharitable sheet. Unfair journals have to be subsidized by someone. The *United Mine Workers' Journal* has been subsidized by the union. It is not necessary that it should be so if it will give the news in all its completeness and fairness.

The officials from most districts are going to make a determined fight to eliminate foreign languages from the *Journal*. "American English for all" is their slogan. They want to aid in the establishment of schools and are prepared to assist the Americanization committee in conducting a nation-wide campaign for 100 per cent. citizenship.

John P. White addressed the convention, outlining the aims and the plan of operation of the Federal Fuel Administration. He declared that officials of the United Mine Workers had assured President Wilson that the agreement they had made on behalf of the mine workers would be approved. He felt that the mine workers' organization was bound by that pledge of honor. The hour of debate ceases, he declared, when the Government declares war. The decision of the Government becomes the patriotic duty of every loyal citizen.

He declared he would defend the agreement against all comers. The penalty clause might be criticized, but all it did to the mine worker was to take away from the local union the right to do wrong by declaring local and unjustifiable strikes. Mr. White reviewed his administration, commended Doctor Garfield and served notice that he was going to the bat with those who would destroy the high standing in public won by the mine workers. Secretary of Labor Wilson wired his regrets that he could not be present, owing to pressure of business. He urged the mine workers to remain loyal and outlined the reasons for the war, predicting that victory would be assured by the unswerving devotion of the workers.

Dr. H. A. Garfield sent the following message: "I appreciate sincerely the loyal response made by mine workers to appeals for coöperation with the Government in the present emergency. The steady decrease in the tonnage lost by labor shortage since August is eloquent testimony to this coöperation. I have ventured to state on many occasions that both mine workers and operators have displayed a laudable purpose as American citizens to put aside differences in the present emergency and to unite during the war in a common purpose to increase the production of coal. The successful prosecution of the war depends as much on the men in the mines as on the men in trenches. I regret I cannot be with you."

Dr. Garfield added that John P. White would speak for the Fuel Administration. After the speeches and the messages just reported were read the convention adjourned to await the reports of the committees for the day.

Walker and Howat are said to be in a deal to fight for the reopening of the contract on Apr. 1. They are said to entertain no hopes that the mine workers will secure an additional increase at that date, but they hope to force the Administration into a conference into which they could not enter without certainty of failure. Then the leaders having failed, it will be possible to circularize the membership alleging that if Walker's and Howat's advice had been taken an increase of from 20 to 50 per cent. could have been secured. Continuous propaganda would follow in the hope that when the election came in December, 1918, it would find Walker and Howat in high favor with the voters

Low Coal Gets Higher Scale

Kansas has two seams of coal, the upper or Lightning Creek seam, which ranges from 20 to 25 in. in thickness, and the lower or Weir-Pittsburgh seam, ranging from 28 to 46 in. in thickness, to quote the 1915 inspection report of the State of Kansas, and from 33 to 42 in. thick, to quote Eugene McAuliffe's account of the Kansas field (September issue, 1917, American Institute of Mining Engineers, page 1392).

The United Mine Workers and operators of Kansas agreed Dec. 22 to grant a differential of 6⅔c. per ton in favor of the upper bed. The coal, though thin, is said to be of higher grade than that in the lower bed. It covers thousands of acres in Crawford and Cherokee Counties.

This long line of shivering women rejoices to hear that the anthracite miners are doing their utmost to produce the coal for which there is so much need.

Courtesy of New York Tribune

A long coal line at Fishman's yard, in Goerck Street, New York City, extending around the corner into East Houston Street. The line forms before the yard opens at 7 o'clock in the morning and continues until the yard closes its doors at 6 o'clock in the evening.

DISCUSSION BY READERS

First Aid to the Uninjured

Letter No. 1—I have read with increasing interest the many letters appearing in *Coal Age*, under the head "Discussion by Readers," and can say that I have gained a large amount of useful knowledge from the many spicy contributions.

Since the closing of the discussion on "Qualified Mine Foreman," it has occurred to me that space would be available, in these columns, for hearing what readers have to say on an important subject that is of vital interest to all foremen and, yet, is largely neglected by the great army of men who are in charge of coal mines. We read much about "First Aid to the Injured," and great attention is paid to giving all needed instructions in rescue work and holding first-aid contests.

I remember, however, that Mine Inspector P. J. Moore, a few years ago, prepared an interesting paper entitled "First Aid to the Uninjured." The paper was read at the annual meeting and was published in the proceedings of the Mine Inspectors' Institute of the United States of America, 1914, and contained many pertinent remarks. May we not have, in *Coal Age*, a thorough discussion of the many points involved in giving first aid to the uninjured?

Statistics Compiled by the Bureau of Mines

For the purpose of showing the need of energetic efforts to reduce the loss of life in coal mining, in this country, the United States Bureau of Mines shows that over 9,800,000,000 tons of coal have been mined in this country since the first inspection law was passed following the great Avondale disaster of 1869. That law was passed by the Pennsylvania State Legislature in 1870.

The records show that from the year 1870 to the present time, 54,543 men have lost their lives in coal-mining accidents. During the same period, the death rate is given as 3.30 per thousand men employed in the mines; or 55 lives have been sacrificed for every 10,000,000 tons of coal mined, which corresponds to a production of 180,676 tons of coal per life lost.

That the conservation of human life, in coal mining, is of paramount importance no one will deny. Each fatal accident in the mines leaves its impress on the community, in the loss of a useful citizen who is too often the bread winner of a family. With a view of reducing to a minimum the number of accidents occurring in mines, most coal-producing companies conduct campaigns of education employing different methods to impress upon their employees the need of more care in the performance of their work for their own protection and the security of the mine.

Notwithstanding the great efforts that have been made in this direction, we are forced to admit that while the number of accidents have been reduced, it is practically impossible to eliminate them entirely. There will always be a certain number of so-called "unavoidable accidents," which cannot be foreseen or guarded against.

The consideration of ways and means to reduce the number of accidents in mining work constitute what may be called "First Aid to the Uninjured," and it is this phase of the subject that I would like to see discussed thoroughly in *Coal Age*. Let our mine foremen express their opinions freely along this line and suggest ways of reducing mine accidents to a minimum. I have a few suggestions to make, myself, in the near future, which I hope will aid in this direction.

Carbondale, Penn. CHARLES ARNOLD.

Coal Production and Booze

Letter No. 3—I had hoped to see this subject attract more attention than it did when first presented for discussion, a short time ago. I feel that it is as great a curse as any with which coal mining is afflicted.

It is common for men who are not given to the drink habit, and are good loyal citizens in other respects, to reason that, since it does not make any difference to themselves whether liquor is sold or not, there is no reason why they should care to make an effort to prevent its manufacture and sale to others. If such men would look about them and reflect on the many evil effects of the booze habit, and realize to what an extent it controls production in all industries, but particularly in coal mining, they would be forced to another conclusion and be induced to take an active part in stamping out this great evil.

Effect of the Drink Habit

Men and women addicted to drink will not only spend all they have to satisfy their appetite for liquor, but will often sell their tools and other available possessions to secure enough drink to quench their thirst. I have known miners to part with their tools, seemingly unmindful that these are their only means of earning a livelihood. Women have sold household goods and pawned articles of jewelry and wearing apparel to satisfy the appetite of which they are the victims. Can anything be more deplorable?

The result to be most dreaded from the yielding to this habit is the condition of the drinker in which he is led to do things that he would never be guilty of doing when in a sober state. The spread of the drink habit in any community drives out the better class of residents, who are forced to seek a home among more respectable associates. Such a condition prevailing in a mining camp is a decided loss to the industry and a menace to the safety of mining operations in that locality.

It will be generally acknowledged that the only satisfactory way of combating the drink habit in a community is to remove the cause. As long as the

saloon is permitted to remain in a place, it gives to those who cannot control their appetite for drink an opportunity to satisfy their thirst, which they continue to do daily.

The present is a time when every man should feel it his duty to aid his country in every way possible. He can do no more effective work, in the present crisis, than to take his share in driving out the causes of wastefulness, incompetency, sickness, and shortage of coal production, all of which are the direct result of booze. To win the war for democracy and make the world one great republic, we must drive out this curse of our country.

Intemperance and the War

The war has taught the people of Europe that booze is their greatest enemy, and they have not been slow to take steps to reduce its effect in their midst. Mine officials and miners should realize that the same is true in respect to the coal-mining industry. All mining men will agree that the booze habit is the direct cause of men losing many days' work, and the output of the mine is reduced in the same proportion. It goes without saying that this condition is unnecessary.

The drink habit lowers the standard of morals among mine workers, who are made more reckless, thereby, and the safety of the mine menaced, while the quality of the coal produced falls below the standard. At times, it happens that the drinker is a man in charge of some important operation or work; and, as a result of his temporary incapacity for the proper performance of his duties, an accident results that shults down the mine for days or weeks at a time. Let us then do what we can to remove this shameful cause and strengthen the coal industry and make the mines safer for work.

Hooversville, Penn. J. H. Tipton.

Surveying and Mapping

Letter No. 2—Referring to the article of W. L. Owens, *Coal Age*, Dec. 8, p. 960, I note he takes exception to the system of using the same station numbers, in different entries in the same mine, and advocates a continuous numbering system for the entire mine. Mr. Owens gives as his main reason for this procedure that it is a great help in locating one's self in a strange mine, by noticing the station number marked on the rib and finding that number on the mine map, a blueprint of which is carried by the person.

My own preference, in this regard, is to adopt a system of stationing each entry, beginning at zero and numbering each station of 100 ft. consecutively; thus, 0, 1, 2, 3, etc. These even stations may or may not correspond to a transit point which, in the latter case, takes its number from the last station plus the distance to the transit. All station numbers are marked with whiting on the rib.

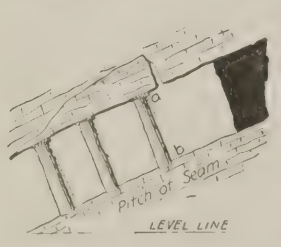
For example, station numbers on the main heading start from zero at the shaft and continue, in the manner described, to the face of the entry. The butt headings driven off the main entries, likewise, starting from zero on the main heading, are numbered consecutively to their face. Also, the room headings, starting from zero on the butt entries, are numbered consecutively in the same manner.

This system of numbering stations enables the distance between any two points or the length of the entry to be ascertained at once. Also, by adding the plus of any entry to the plus on the main heading at its mouth, the required distance from the shaft is obtained.

Elevations are taken at each of the even stations and at any intermediate points where the grade changes. These elevations are marked on the map, and the difference between the elevations of two consecutive even stations gives the grade of the entry for this stretch. This is a great help in planning ditches, or grading for permanent track, where the irregularities are not too great, in which case the engineers must set grade points. By heading the traverse sheets of each entry with the name of the heading there can be no confusion of station numbers, either in the mine or on the map.

Curtisville, Penn. G. G. Long.

Setting Timber on a Pitch



Letter No. 1—Referring to the inquiry of W. T. Hale, *Coal Age*, Dec. 22, p. 1072, asking how timber should be set on a pitch of 20 or 25 deg., when the roof and floor of the seam are hard and smooth, permit me to offer one or two suggestions in addition to the points touched upon in the reply made to this inquiry.

It can be assumed from Mr. Hale's description that the roof of this seam is strong and will be apt to break in a large mass covering a considerable area. In that case the tendency of the roof to slip down the pitch will be manifested to a much less degree than where the roof is frail and breaks in smaller pieces.

Where the roof is strong and supported against slipping by strong gangway stumps and pillars, the principal roof pressure will be in a direction normal to the seam. In that case the resistance of post timber will be greater if the props are set to correspond more nearly to a normal position in the seam.

On the other hand, if it is assumed that the roof slate is friable or contains joints, which cause it to break in smaller pieces and increase the tendency to slip down the pitch, it is necessary then to give each post a slight inclination up the pitch from the normal. As stated in the reply to this inquiry, such a position of the post will cause it to tighten when the roof begins to move.

Again, with a frail roof such as I have just mentioned, a break will often occur a short distance back from the face of the coal, as illustrated in the accompanying figure. As here shown, this will leave a large piece of rock that is ready to fall vertically. In that case, if the posts supporting the rock were set normal in the seam, the loose piece would have a tendency to ride the props and fall in the direction of the dip. If, however, the supporting posts are underset slightly at the bottom and the foot rests in a hole cut in the floor of the seam a few inches below the normal line *ab*, drawn through the top of the post, any slip of the loose piece will tend to tighten the post and bind the rock against the roof, holding it secure.

Experience teaches that it is wiser to give the props too little rather than too much underset. In case the

underset of a post is too great, a loose piece of top will tend to ride the post and fall in the direction up the pitch. This cannot occur if the underset is less than it should be, as the tendency of the rock to ride the post is then checked by the loose piece being wedged against the solid formation.

The amount of underset of a post will vary with the inclination of the seam and the general character of the roof strata. A good rule, in practice, is to set the post so that the angle it makes with the normal in the seam will vary from one-fifteenth to one-fifth of the inclination of the seam. In the present case, taking the inclination of the seam as 25 deg., the post should be underset to an angle varying from 2 to 5 deg., according to the nature of the roof. In mining practice the tendency is to give a post too much underset and care should be taken to avoid this.

In order to prevent posts from being knocked out by coal blasted from the face, the foot of each post should be sunk at least 2 in. in the floor of the seam and the head of the timber tightly wedged against the roof.

Oak Hill, W. Va. WILLIAM DICKINSON.

Answering Examination Questions

Letter No. 1—I have always been interested in the question of blasting coal, and it has seemed to me when reading over examination questions that bear on this subject that there is not sufficient time given to candidates to answer such questions properly.

A question relating to blasting appears in *Coal Age*, Vol. 11, p. 1134. The question is divided into three parts—a, b, c—and while the answer given is clear and mentions many important points in reference to blasting coal, the answer does not meet my idea of how a candidate should reply to such a question. It has always been my practice to study carefully the mine law and arrange a key to the different articles and sections of the law that will enable me to answer fully certain questions that may be asked.

PENNSYLVANIA LAW REGARDING BLASTING

Speaking of blasting coal, my key, as I remember it, was the following: Art. 4, secs. 9, 10, 14; art. 7, sec. 4; art. 9, sec. 1; art. 11, secs. 54 and 87 to 97, inclusive; art. 16, secs. 1, 2, 3; art. 25, Special Rule 1; General Rules, 3, 13, 14 and 18 to 25, inclusive. It was my habit in examination to take up each of these references in order and comment on the requirements of each. Only in this way can a complete answer be given to important questions such as blasting.

It is true that there are many duplications in the several references just mentioned; but, in my opinion, there is no other way of giving a complete answer to such a question, as the mining law is drawn with the intention of making the work of blasting coal safe.

If blasting in coal mines was carried on according to the requirements of the Pennsylvania Bituminous Mine Law, there would be little cause for anxiety when the work is performed under dangerous conditions. Trouble arises wholly or chiefly from illegal practices in blasting. Some miners are in ignorance of the requirements of the law and face these dangers unknowing, but many others are reckless and disregard both the law and the mine regulations—they take a chance.

In closing, let me say that during the five years when I worked at Monckton Main, Yorkshire, England, there was no shot fired in all that time. The coal was broken down by what was then known as the "plug and feather" method of mining. This regulation forbidding the blasting of coal was enforced in that mine more completely than in any mine in which I have worked in this country. Although no coal was blasted, better results were obtained in producing a good output per man than is realized in the mines here, and the dangers of blasting were wholly eliminated. JOSEPH A. GREAVES,

Macdonaldton, Penn. Mine Foreman.

Wagon Mines vs. Patriotism

Letter No. 4—A short time ago, several letters appeared in *Coal Age* regarding the advisability of operating small coal mines that cannot be worked to the same advantage or with the same efficiency as larger mines furnished with up-to-date equipment.

There are two sides to the question, which must both be considered before a correct judgment can be given. In favor of the continued operation of such mines, it can be argued that they commonly represent the invested savings of practical mining men who through frugality and hard work have managed to accumulate a few hundred dollars. With this capital they have secured the control of a small piece of coal land, which is generally isolated from any railroad or other means of shipping the coal.

CONDITIONS SURROUNDING SMALL MINES

In most cases the coal lies near the surface or outcrops on the property, which enables it to be reached by a drift or slope at small expense. The seam may be thin and the coal of an inferior quality that would offer no inducement to a company of large means. The small capital invested will not permit of the erection of a tipple or the construction of a sidetrack, and the coal must be transported from the mine to the railroad by wagons. The expense of handling the coal in this manner is great and leaves only a small profit.

In the present crisis these small mines are face to face with the difficulty that they cannot secure cars for loading, the railroads being compelled to refuse them this service owing to the scarcity of flats, which can be loaded more promptly at the larger mines. That the railroads are guilty of discrimination is true, but a little reflection seems to make this justifiable. Knowing several of these small operators who have invested their all in the undertaking and are now compelled to shut down their mines, I sympathize deeply with them in the present condition.

Looked at from another angle, however, the situation presents a different aspect. The thought of every man, woman and child is, or should be, that America is at war, and everything must give place to that condition. When we are told that the output of the coal mines the past year is 50,000,000 tons short of the demand, we realize that not a shovelful of coal should be turned over twice except it be absolutely necessary. Unless every effort is made to conserve the means of producing coal, what can we expect in the coming year, judging from the shortage of 1917, and knowing that America has as yet scarcely fired a shot?

Labor is scarce in all industries throughout the country and men are needed everywhere. As little foreign labor is available, it is more than ever important that the men now employed in the coal mines should be used in the most effective manner possible. By way of illustration, compare the results in the operation of wagon mines with those obtained in larger mines equipped with every needed appliance to handle the coal quickly and at the least expenditure of money and labor.

In the small mines the work is almost wholly pick work, and a miner can mine, say six tons of coal a day, which is hauled to the surface by mules or pushed by hand. The mine is, perhaps, a mile from the railroad, and the loading of a 50-ton car, standing there on the siding, will require six two-horse teams making four trips a day. Thus, the entire operation of mining and loading this coal will include the work of eight miners, two mule drivers and six teamsters, making sixteen men, two mules and twelve horses, to say nothing of other bosses and helpers.

Conditions in the Larger Mines

Look now, for a moment, at an up-to-date machine mine where a miner will mine from 12 to 14 tons of coal a day, which is hauled out of the mine by motors and loaded by machinery into the railroad cars standing under the chutes at the tipple. In this comparison we are not interested in the relative cost of production, which is much less per ton of coal mined in the larger mines than in the smaller operations. My desire here is to refer to the most effective use of all available labor, in the effort to secure the largest possible output of coal and the greatest economy in the distribution and use of railroad cars for its transportation to market.

In the thoughtful consideration of this question, no one who is loyal to our country can reach but one conclusion, although that may seem to work a hardship on many small operators. The present is a time when individual interests must be sacrificed to the general welfare and safety of the country.

Heilwood, Penn. Thomas Hogarth.

Clearing a Heading of Gas

Letter No. 5—In common with other writers who have discussed the matter of clearing a heading of gas by hanging a canvas on the return airway, 90 ft. back from the face, as described in the inquiry of "Mine Foreman," *Coal Age*. Nov. 10, p. 823, I was inclined not to take the suggestion seriously. But, as someone has expressed it, the plan appealed to me at first as "a joke."

It seems natural to suppose that probably four men were working at the head of these two entries, and if such was the case, since gas was being generated, the law would require a circulation of 200 cu.ft. per man per minute, which would mean a current of 800 cu.ft. per minute passing through the last crosscut. Practically all firebosses will agree that the proper thing to do to clear these headings of any accumulated gas would be to carry the air current up to the working face, by extending a brattice from the outby rib of the crosscut.

If a brattice was set 18 in. from the rib, the coal being 6 ft. thick the air space behind the brattice would be about 9 sq.ft. Then, if the required quantity of air was in circulation, the current would have a velocity of 200 ÷ 9 = say 88 ft. per minute, which would be ample for the removal of gas in most cases. However, in order to effect the complete removal of the gas, it may often be necessary to extend the canvas at the end of the brattice toward the roof so as to deflect the air against the gas.

In the present instance, however, this plan appears to have failed, and recourse seems to have been had to a most unusual scheme—namely, shutting off the return airway by hanging a canvas on that entry, 90 ft. back from the face. It is little wonder that such a plan is commonly condemned as bad practice, and I am not ready, myself, to say otherwise.

For the sake of argument, however, let us view the case from another standpoint. It is well known that firebosses frequently adopt unusual expedients to overcome difficulties with which they are beset. A fireboss is charged with the duty of quickly removing any dangers existing in working places, so as to permit the men to proceed to work without loss of time. It is rare that trouble results from the neglect of carelessness of firebosses, who are naturally more cautious and feel greater responsibility than other men working in the mine.

Suggests a Possible Explanation

There is just one aspect of this proposition that gives it a more reasonable appearance. Consider, for a moment, there are two airways, say 6 x 8 ft., each 90 ft. long, giving an air space of nearly 9000 cu.ft., which is filled with air and gas. It may be assumed that the body of gas it is desired to remove is lodged at the head of these entries. Now, it is possible that the fireboss, in this case, reasoned that the closing of the return airway would allow the gas accumulated at the face to diffuse throughout the entire air space and thus be diluted below the explosive point. The question is, Was he correct in making this assumption?

When the return airway was closed there would still be a gentle circulation of air, owing to the cooler air at the bottom of the entries rising toward the roof, and this would have a tendency to assist the diffusion of the gas working along the roof. My idea is that, finding the brattice did not remove the gas, this fireboss sought to dilute the latter by giving time for diffusion to take place.

I would like to ask what other gas inspectors and firebosses would do to effect the complete removal of gas located at the head of a pair of entries going to the rise, provided the brattice extended close to the face failed to accomplish the desired result.

Worley, Ky. Gas Inspector.

The Handling of Men

Letter No. 5—Mine officials, for some time, have recognized that the efficient handling of men is one of the largest factors in the economical mining of coal. This was never more true than at the present time when labor is growing more scarce every day, owing to the decreased immigration and because many of our best, most ambitious and intelligent miners have left the mine for work in factories or on the railroads. Also, a large number of reservists have returned to

their own country to take their share of the burden of war.

Miners and daymen working in the mine have taken advantage of this condition and have made demands that are often unreasonable. The day is past when you can show a miner a wet place, which they have learned to call a "dog hole," and tell him to "work that or nothing." The mine foreman is no longer, as formerly, the company's "slave driver," and the worker his slave. In the present order of things the successful mine foreman must be a good general. He must know his men and understand human nature.

Successful mining requires a good organizer in charge of the work. The great problem is to get the right man in the right place. There are many misfits both in coal mining and other industries. If some great power could take these misfits and place them where they belong—in other words, give them work suited to their capability and nature—what a great change would result in our industrial enterprises.

The story is told of a minister and one of his elders —a farmer—whose views differed widely. The minister had been contemplating the heavens and remarked that he had received his first inspiration to preach the gospel from tracing the letters G. P. C. among the stars. These letters, he said, meant "Go preach Christ." At this point, the elder interrupted the minister by suggesting that, to his mind, the letters meant "Go plow corn."

Conditions Then and Now

Our older mining men who have established a successful record for themselves, by reason of their habit of driving men and forcing them to do the work before them or quit, are not as successful today when conditions are so greatly changed. An incident that illustrates conditions a few years ago is the following:

On making application for work, a man was asked by the foreman, "Are you a good miner?" His reply was, "I believe so." "Well," said the foreman, "will you tell me what qualifications a good miner should have?" The man hesitated a minute and then replied, "A strong arm and a weak head."

At that time, there was more fact than fiction in the miner's reply. The more intelligent mine worker could not stand the abuse that was commonly heaped upon him by the foreman, and it was the fellow with the "weak head" that got along the best in the mine, while the better class of men were forced out of the mine to seek work among more congenial surroundings.

It was this trend of affairs in coal mining that is largely responsible for the present scarcity of labor, since it resulted in the necessity of the employment of a large proportion of foreign labor that has not only been subject to the call to arms, from their home lands, but forms a class with whom our mine officials do not naturally mix.

Yes, present conditions make the tactful handling of men a most important feature in the operation of the mines today. By such means I have been able to get men to work a back heading, in low coal going to the dip and where the water ran in streams from the roof, so that the men were obliged to wear gum suits.

These were young men, however, and equal to the task. The work required the constant use of a hand pump, and it was necessary to push the cars in and out of the place. At the end of the day the men would be wet to the skin, but they both stayed by the job until, finally, they were forced to quit, being so stiff that they could scarcely get about.

My remarks may arouse the question of mine discipline being set aside, but such is not the case. Discipline is strengthened when the men realize that the work must be done, and the honest worker is more inclined to take his share in serving the interests of the company when treated kindly.

No rule can be given for the use of tact in handling men. I could not follow another's plan nor expect another to adopt mine. The main point, however, is that mine officials and miners regard each other's interests more than is common at the present time.

Osceola Mills, Penn. S. D. Hainley.

Relative Size of Intake and Return Airways

Letter No. 2—In discussing the question of which should have the larger sectional area, the intake or the return airway of a mine, F. E. Schroyer states, *Coal Age,* Jan. 5, p. 32, "The haulage road should be the larger airway, regardless of whether it is the intake or the return."

Mr. Schroyer claims that the resistance of the moving cars to the passage of the air on the haulage road demands an increased sectional area. In this regard, it would be well to remember that trips are hauled in both directions on the haulage road and, while they obstruct the passage of the air when going in one direction, they assist it when passing in the opposite direction.

In considering conditions affecting the size of haulage roads, the safety factor calling for a good uniform clearance at the side of the track is important and may require an increased sectional area of the haulage road.

This question naturally suggests another of equal importance, which must be answered before it can be determined whether the area of the intake or return airway of a mine should be the larger. The question is one on which there has been some difference of opinion. It is, Should the haulage road of a mine be made the intake or return airway?

Some have argued that the answer to this latter question depends on whether the mine is or is not generating gas in dangerous quantity. Most mining men agree that, in the case of a mine generating gas, haulage should be performed on the intake airway, for the reason that greater safety is insured where this work is performed on the fresh air current, which is free from gas.

Making the intake airway the haulage road, however, necessitates the use of an exhaust fan for ventilation. On the other hand, since the blowing system of ventilation possesses certain advantages, and as this system requires that haulage be performed on the return airway, it seems better to adopt this plan in a mine not generating gas.

We must therefore conclude that, in the operation of a non-gaseous mine where haulage is performed on the return airway, all considerations point to making the sectional area of that airway larger than the area of the intake, since it has been pointed out that the return air is generally larger in volume than the intake.

Thomas, W. Va. W. H. Noone.

INQUIRIES OF GENERAL INTEREST

Boiler Horsepower

I have a somewhat hazy idea of the meaning of the term "boiler horsepower" and its relation to the indicated horsepower of an engine. Kindly explain the use of this term and state whether a boiler of 25, 50 or 100 hp. will furnish sufficient steam to operate an engine designed to develop the same horsepower. In other words, when estimating the size of boiler required to operate an engine of a given rated horsepower, is it correct to take the horsepower of the engine, as the required horsepower of the boiler? MINE ENGINEER.

Charleston, W. Va.

The term "boiler horsepower," used to express the capacity of a boiler to supply the necessary steam to operate a particular engine for a given service, has no reference whatever to the indicated horsepower developed by that engine in performing the specified service. A boiler horsepower is an arbitrary standard that has been adopted for the rating of boilers. It has reference to the weight of water evaporated per hour or the weight of steam generated in that time. The standard boiler horsepower adopted by the Society of Mechanical Engineers and now in general use is the evaporation of 34.5 lb. of water per hour, from a feed-water temperature of 212 deg. F. to steam at the same temperature. This arbitrary standard serves merely as a unit or basis for rating the evaporative capacity of a boiler.

The capacity of a boiler to generate steam differs widely in different types of boilers and in boilers of the same type designed for different service. It depends primarily on the extent of heating surface, but is modified very largely by numerous other factors, such as the quality of the coal burned, its rate of combustion as influenced by the draft, grate area and depth of fuel, manner of firing, the character of the feed water and the care taken to keep the boiler in proper condition.

A boiler rated at 100 hp., under proper care and management, should be capable of generating the equivalent of $100 \times 34.5 = 3450$ lb. of steam per hour, from and at 212 deg. F. The consumption of this weight of steam per hour, by an engine, however, does not mean that the engine is developing 100 hp. An engine developing that horsepower may consume more or less steam per hour, according to its type of construction and numerous details that render the engine more or less efficient in the development of power.

For the sake of illustration, we will consider, here three types of steam prime movers represented by the steam turbine, the Corliss condensing engine and the simple, noncondensing, slide-valve engine. Every engine has a specified water rate, which is guaranteed by the manufacturer. This water rate differs widely in different types of engines and with different manufacturers.

The term "water rate" refers to the weight of steam consumed by an engine, per indicated horsepower-hour. Of the three types of prime movers mentioned, the steam turbine has the lowest water rate, which ranges from, say 8 to 15 lb. of steam consumed per indicated horsepower-hour. A Corliss, condensing engine, has a rate commonly ranging from 18 to 25 lb. of steam consumed per indicated horsepower-hour, while a simple, noncondensing, slide-valve engine, may have a water rate ranging from 30 to 60 or more pounds of steam consumed per indicated horsepower-hour. In any of these types of engines, the actual steam consumption, per indicated horsepower-hour, depends upon the degree of efficiency in the design and workmanship of the engine.

Now, applying these facts to determine the size of boiler required to operate, say a 100-hp. simple, noncondensing, slide-valve engine, using dry, saturated steam, at 120 lb. pressure and having a guaranteed water rate of, say 40 lb. of steam per indicated horsepower-hour at full load, the actual steam consumption will be $100 \times 40 = 4000$ lb. per hour.

Then, assuming a feed-water temperature of, say 70 deg. F. and reducing this steam consumption to its equivalent evaporation from and at 212 deg. F., by multiplying by the corresponding factor of evaporation, which is 1.192, for the given temperature and pressure, we obtain $4000 \times 1.192 = 4768$ lb. per hour. The required boiler horsepower, in this case is, therefore, $4768 \div 34.5 = 138$ boiler-horsepower.

To produce the same indicated horsepower when using a Corliss condensing engine having a water rate of, say 22 lb. of steam per indicated horsepower-hour, which corresponds to a steam consumption of $100 \times 22 = 2200$ lb. per hr., would require an equivalent evaporation of $2200 \times 1.192 = 2622$ lb. of water per hour, and the required boiler horsepower, in this case is $2622 \div 34.5 = 76$ boiler-horsepower.

Increase in the Emission of Gas Following an Explosion

I have noticed, on one or two occasions, that there appeared to be an increase in the quantity of gas given off in the mine immediately after an explosion, as working places contained considerable quantities of firedamp that should have been consumed if present previous to the blast. If this is possible kindly explain its cause.

———, Colo. FIREBOSS.

Immediately following an explosion of gas or dust in mine workings, there is formed a more or less vacuous condition of the air in the mine. While this is owing, in part, to the rush of the explosive wave toward the mine entrance, it is chiefly or largely due to the cooling of the atmosphere remaining in the mine, owing to the rapid absorption of heat by the strata. The vacuous condition thus created has a tendency to reduce the pressure and invites a greater outflow of gas from the strata, which may frequently occur at the face.

EXAMINATION QUESTIONS

Difficult or Unpractical Questions Asked in Examinations

Ques.—A sample of firedamp taken from the mine is found to have a specific gravity of 0.9; what are the proportions of the mixture? Please show the method of working.

Ans.—In order to arrive at any satisfactory solution of this question, it is necessary to assume that the firedamp is composed wholly of methane (CH_4) and air. Then, denoting the percentage of methane by x, 100 volumes of the mixture will contain x volumes of gas and $100 - x$ volumes of air.

But, since the specific gravity of methane, referred to air as unity, is 0.559 and the weight of gas or air is found by multiplying its volume by its specific gravity, that of air being 1, the relative weight of gas, air and mixture, in 100 volumes of the firedamp, is as follows:

Weight of methane, $0.559 \times x = 0.559x$
Weight of air, $1(100 - x) = 100 - x$
Weight of mixture, $0.9 \times 100 = 90$

Finally, since the sum of the weight of the gas and air is equal to the weight of the mixture, we have

$$0.559x + 100 - x = 90$$
$$x(1 - 0.559) = 100 - 90 = 10$$
$$x = \frac{10}{1 - 0.559} = \frac{10}{0.441} = 22.67 \text{ per cent.}$$

A firedamp mixture consisting of pure methane and air and having a specific gravity of 0.9, therefore, contains 22.67 per cent. of gas.

Ques.—A gravity plane has an inclination of 7 deg. and is 1800 ft. long; the rope weighs 3800 lb. A loaded car weighs 2800 lb. and an empty car 1500 lb. What number of cars must be in the trip to start it?

Ans.—The angle of inclination being 7 deg., its tangent is 0.12278, and the grade of the incline is, therefore, say 12.3 per cent. or 0.123, expressed decimally, which is the gravity factor in this calculation. Also, assuming a track resistance of, say 30 lb. per ton, the frictional factor resisting motion is $30 \div 2000 = 0.015$.

In the operation of a gravity plane, the number of empty and loaded cars is equal and the weight of these cars is therefore balanced, while the weight of the rope and the coal hoisted is unbalanced. Hence, the force acting to produce motion is the gravity pull due to the weight of the coal hoisted, in a single trip, while the forces acting to resist motion when starting the trip are the gravity pull of the rope and the friction pull of the entire moving system.

Calling the number of loaded cars in a trip n, the weight of coal hoisted in a single trip is $(2800 - 1500)n = 1300n$. The gravity pull due to this weight of coal is, therefore, $0.123 \times 1300n =$ say $160n$, which is the force acting to start the trip. But the weight of the rope being 3800 lb., its gravity pull is $3800 \times 0.123 =$ say 467 lb. The combined weight of one loaded and one empty car is $2800 + 1500 = 4300$ lb., which makes the weight of the loaded and empty cars, in a single trip, $4300n$ lb. Adding to this the weight of the rope (3800 lb.) gives for the weight of the entire moving system $4300n + 3800$. This must then be multiplied by the frictional factor 0.015, to obtain the frictional resistance to motion, which added to the gravity pull of the rope (467 lb.) gives the total force resisting motion.

Finally, equating the force producing with that resisting motion, we have,

$$160n = 0.015(4300n + 3800) + 467$$
$$160n = 64.5n + 57 + 467$$
$$95.5n = 524$$
$$n = \frac{524}{95.5} = 5.4, \text{ say 6 loaded and 6 empty cars.}$$

Ques.—What is the safe working load of a crucible steel rope 1¼ in. in diameter, on a slope 500 ft. long and dipping 35 deg.?

Ans.—The safe working stress, in a six-strand, crucible-steel haulage rope, 1¼ in. in diameter, assuming a factor of safety $f = 8$, for hoisting on this long steep slope, is

$$S = \frac{37d^2}{f} = \frac{37(1\frac{1}{4})^2}{8} = 5.85 \text{ tons}$$

Since this question gives the inclination and length of the plane, it evidently intends to ask for the maximum safe load that could be hoisted. To ascertain this load, let W = the combined weight of the loaded trip and the rope. The gravity pull due to this weight resting on an incline making 35 deg. with the horizontal is W sin. 35 deg. = 0.573 W. Again, assuming a track resistance of 30 lb. per ton, and allowing this to apply likewise to the friction of the rope resting on the rollers, the normal pressure on the plane due to the entire load being W cos. 35 deg. = 0.819 W, the friction pull is $30(0.819\ W) \div 2000 = 0.012\ W$. The total pull, or the sum of the gravity and friction pulls is, therefore, $(0.573 + 0.012)W = 0.585\ W$.

Finally, equating this last result with the safe working stress of the rope, found previously, gives for the total weight of the loaded trip and the rope $W = 5.85 \div 0.585 = 10$ tons. But a 1¼, six-strand wire rope weighs 2 lb. per lineal ft., which makes the total weight of the rope resting on the incline $2 \times 500 = 1000$ lb., or ½ ton. Deducting this from the total weight just found gives 9.5 tons as the weight of the loaded trip or the maximum allowable load hoisted.

Ques.—What is meant by the "equivalent orifice" in mine ventilation?

Ans.—This question has little practical bearing on the question of fan ventilation to which it is usually applied. It expresses the ratio of the quantity of air in circulation to the square root of pressure or water gage. Practically it is impossible to measure the water gage due to passing a given quantity of air through a fan, and for this reason the use of the term in ventilation is limited and of little value.

Coal and Coke News

For the Busy Reader

For the first time in its history, the Thomas A. Edison plant was closed recently. Lack of fuel was the cause.

* * *

No excuses will be received from coal concerns under contract to furnish coal to the camps and cantonments. Fuel for this purpose will, under an order just issued, have priority over all other requirements except railroad fuel.

* * *

By definite order of the Fuel Administrator all industries east of the Mississippi must be closed for five days, beginning Friday, Jan. 18. After that period not a plant in the affected district must burn fuel for ten consecutive Mondays. The order has met with much criticism.

* * *

The Federal fuel administrator of Iowa is performing a service that is worthy of emulation elsewhere. He has secured the services of six expert firemen, who visit every city of consequence in the state and give instructions to the firemen in the apartment houses, hotels, etc., as to the proper method of using their coal.

* * *

To expedite the movement of coal into New York City an arrangement has been made to utilize the car floats of the Pennsylvania R.R. to carry coal cars from Jersey terminal points through New York Bay to coal yards on the Harlem River. Plans are also being made to handle coal by all-rail routes to New England up the west bank of the Hudson River.

* * *

M. A. Hanna & Co., of Cleveland, Ohio, which controls the Susquehanna Collieries Co., with operations in the Shamokin, Wilkes-Barre, Nanticoke, Pottsville and Lykens regions, announced a 75c. a ton increase on all sizes of anthracite coal. The increase, it is said, follows Governmental satisfaction that the collieries have actually passed from Pennsylvania R.R. control to independent ownership.

* * *

The Chesapeake & Ohio has lost part of its bunker business because of the recent Government order requiring vessels to load from barges in the stream instead of from alongside piers. This had proven such slow work masters of a number of ships, instead of stopping at Newport News, have gone on to Norfolk for coal. There has been filed with the Government a protest against the new order, it being claimed that the port is being injured as a result.

* * *

The reports received from Deputy Fuel Distributor D. R. Lawson, of Fairmont, W. Va., show that the new plan of the Fuel Administration of decentralizing the distribution of emergency orders for coal is working admirably. Under the new plan every mine in the district has been receiving at least partial supplies of cars, and the daily loss of tonnage, which formerly ranged from 32,000 to 38,000 tons has been reduced to from 1500 to 2500 tons.

* * *

No. coal will be exported from the United States during 1918 "except for purposes contributing materially to the conduct of the war." This policy, it was announced on Jan. 7 after a conference of officials of the State Department and War Trade Board with Dr. Harry A. Garfield, Federal Fuel Administrator, inaugurates a sweeping control of the export coal situation, which may throw into the discard all existing contracts for deliveries this year. Bunker coal is not affected by this decision.

HARRISBURG, PENN.

"Ten million dollars annually will be the direct loss to the State of Pennsylvania under Government ownership of the railroads," said Chairman Ainey of the Public Service Commission of Pennsylvania, on Jan. 11. He stated that a similar loss was almost sure to follow if railroads are to be Federally incorporated. For the years 1915-1916 the railroads paid into the State Treasury nearly nine millions of dollars, and that amount has been increased until it now reaches the enormous sum of about ten million. The loss of such an amount would seriously affect the revenues of the state and could only be met by imposing larger burdens of taxation upon coal, oil and other minerals, and an increase in taxes upon public utilities, coal companies, etc.

Chairman Ainey, after a conference with Director General McAdoo, on Jan. 11, issued an order increasing demurrage rates on cars on railroads in Pennsylvania effective Jan. 21.

Demurrage charges per car per day or fraction of a day are to be $3 for first day, $4 for second day, and for each succeeding additional day the charge to be increased one dollar in excess of that for the preceding day until a maximum of $10 per car per day shall be reached on the eighth day of detention beyond the free time, the charge thereafter to be $10 per car per day.

The Clearfield County Dry Federation, in half-page advertisements, has started its fight to drive the saloon out of Clearfield County, and everything possible is going to be done to give the knockout blow at the coming license court to be held Jan. 21. Remonstrances were signed in all the churches of the county, and from now on a house-to-house solicitation is to be made to get signers to the remonstrances.

In its half-page advertisements the Federation says: "Quit kicking about coal. Of course there is a coal famine, but what of it? During the last fiscal year the breweries in America produced 60,729,509 bbl. of beer. It requires 248 lb. of coal to produce a barrel of beer. A pound of coal for a pint of beer. In other words, the breweries in America used up 7,530,395 tons in coal during the year in making beer. One hundred and forty loaded ships were lying idle in New York harbor unable to sail for lack of coal. Have you heard of any breweries lying idle for lack of coal? Schools and factories are closed for want of coal. Have any breweries closed for want of coal? Booze or coal?"

Every effort is being made to put 500 saloons out of business in Schuylkill County in the interest of a greater production of coal in the county. A movement has been under way for the last two months to have the Government refuse Federal license to two-thirds of the saloons in the coal region, because of the effect of their business on the efficiency of the miners.

It is said that many collieries are affected from two to four days by lack of workers after pay day, and it is proposed to abolish this condition. The matter has been taken up with the Government because there was little hope for any radical reduction in the number of saloons by the action of the court.

Scranton's biggest legal victory, so far as the mine-cave problem is concerned, came on Jan. 11, when Judge James J. O'Neil, in equity court, granted the City of Scranton an injunction restraining the People's Coal Co. from mining and removing coal and endangering the support of all streets and public highways in the mine-cave area of West Scranton, excepting Main Ave., which was covered by a suit tried in the courts several years ago.

In addition to granting the injunction, Judge O'Neil awarded the city approximately $30,000 damages. Court finds the city is entitled to $23,935.81 for damages to sewers and $5265 for damage caused to paved streets by reason of subsidences.

From the standpoint of establishing certain facts relative to the mine-cave situation, the findings of court make the victory the most sweeping that has yet been won by the people in the fight for surface support. The facts as found by Judge O'Neil have long been considered the crux of the legal end of the mine-cave problem, and they should do much toward helping an early solution of the entire question.

Not only does Judge O'Neil grant the injunction as prayed for, but finds that the city is entitled to 100 ft. of lateral support on each side of the street for the first two surface veins and 1 ft. additional in support for each foot in depth of the other veins. This is what is known as the foot-for-foot rule, or the one-for-one rule. Rough estimates made allow the streets included in the bill lateral support ranging from 100 to 175 feet.

Along with other things, the decision established the constitutionality of the Davis mine-cave act, which established a city bureau of mine inspection and surface support, and required coal companies to file maps of their workings with the city authorities. The case in question was based to a large extent on the powers vested in the city by the Davis act.

Should the views of Judge O'Neil stand in the Supreme Court it will mean that in the future mine-cave suits will have a substantial basis on which to be started. The case decided was started Aug. 23, 1916, and was on trial almost continuously until December of the same year.

The retail coal dealers versus the city of Philadelphia is to be the title of the next chapter in the story of Philadelphia's coal troubles, according to Francis A. Lewis, city fuel administrator. It is stated that one of the coal dealers is about to institute proceedings against the city to recover the loss sustained by him through the coal raids.

In the opinion of Mr. Lewis everything is on the side of the complainant. The city fuel administrator explained the status of dealers who were robbed by saying: "The Act of Assembly of 1844 provides that the county must pay for property destroyed by rioters. The law was clearly upheld at the time of the Pittsburgh riot case of 1877 by Chief Justice Paxson."

During the last few weeks many cars loaded with coal were raided in Philadelphia yards of the Pennsylvania railroads. Crowds numbering as high as 1200 or 1500, equipped with bags, buckets, wash boilers and baby coaches stormed the cars and made off with anywhere from a few tons to the whole carload. Arrests were few. In most instances the police watched the proceedings without offering to interfere, and even magistrates who arraigned those who were arrested were lenient.

PENNSYLVANIA

Anthracite

Pittston—The death toll of the Barnum mine cave, which it was hoped on Jan. 7 had been averted altogether, has now been found to number two miners. Rescuers came upon the body of Steve Jarvis on Jan. 9, and Frank Ciezechski is still missing and small hope is entertained of finding him alive. The shifts of 15 men each are bending every effort to locate the missing man.

Cumbola—In line with the further development of the Schuylkill Valley coal fields, among which is the reopening of the Kaska William colliery, the Lehigh Coal and Navigation Co. is having surveys made and boreholes put down for reference in the location of other collieries, one of which will be at the eastern end of Port Carbon. This will be followed by other operations by that company and by the Delaware & Hudson Co., which owns coal lands near here. These operations will be allied with the New England & Lehigh R.R. over which the product will be hauled to market. An extension from Tamaqua, a distance of 17 miles to Pottsville, will be constructed.

Pottsville—The Philadelphia & Reading Coal and Iron Co., the largest producer of anthracite, on Jan. 10 stated in a document filed in court its intention of opening a number of new collieries and washeries in the Gilberton region. In connection with this the Harleigh Brookwood Coal Co. filed permission for the Philadelphia & Reading Coal and Iron Co. to deposit culm in the streams flowing over the Harleigh tract. Officials of the Reading Coal Co. said that a dozen collieries idle in the Shenandoah and Mahanoy City region for lack of water will resume at once.

Scranton—All owners of property overlying the area affected by the proposed operations of the Se-Rob Mining Co., engaged

at present in removing surface vein coal through a drift opening in the 100 block, driven early last fall, have prepared to institute injunction proceedings against the concern. The injunction will seek to restrain the company from mining, by means of surface processes, the recently discovered top vein of the Price-Pancoast tract.

Retreat—Mining of coal from the Susquehanna River on a large scale is a matter now occupying the attention of officials of the Central district poor board. New equipment is being bought and next spring, or as soon as the weather permits, the work of making the river give up its coal, which was started last year, will be resumed. For some years past the poor board has been mining the coal from the section of the river bed adjoining its property.

Lansford—The Lehigh Coal and Navigation Co. is erecting for its clerks, engineers and superintendents six detached and four semi-detached reinforced concrete dwellings. The houses are located on ground in the center of the town formerly occupied by a culm bank. As a departure from the old way of building all houses alike, this group will consist of five different types of houses. Each house will be situated in a lot from 40 to 45 ft. in width and 150 ft. in depth. The total cost complete, exclusive of ground of the ten dwellings, will be $35,000.

Freeland—A fire of unknown origin was discovered in the Sandy Run mine of M. S. Kemmerer & Co., and caused considerable excitement for several hours. The flames had made great headway through one of the gangways, and the entire fire-fighting force of the colliery was called out. The company is now maintaining a close watch on the affected sections in order to prevent any fresh outbreaks from the smoldering timbers.

Honeybrook—The strippings of the A. E. Dick Co. have been closed down on account of the cold weather. Strippings and all other outside operations have been severely handicapped so far this winter.

Morea—The Morea mine of the New Boston Land Co. is the latest to discard steam for electricity. This mine has just reverted to the control of its original owners after being leased for 30 years to the C. M. Dodson Coal Co.

Beaverbrook—The A. S. Van Wickle estate has started a policy of retrenchment as its Coleraine colliery, where several assistant foremen have been put back to mining.

Bituminous

Punxsutawney—Approximately 50,000 tons of coal is being shipped to New England daily from this district as the result of an order from the fuel administrator to mine operators, commandeering a heavy percentage of their output to relieve the coal shortage in New England. The order is the largest demand made on the mine owners since the fuel administration was formed. Nearly every mine in Jefferson, Indiana, Clearfield, Armstrong and Clarion counties are affected, and many operators have been forced to cancel profitable contracts made months ago to enable them to send coal to New England at the Government price of $2.45 net ton.

Jeneau—The Jeneau Coal Mining Co. has completed several additional miners' houses at its plant here. It is also installing a large set of boilers and an air compressor. The mine has only been opened nine months and now has a capacity of 500 tons per day.

Brisbin—The Franklin Coal Mining Co., on Jan. 11 made a claim on the Pennsylvania R.R. for $6000 damages in a complaint filed with the Public Service Commission. The action grows out of a controversy over a siding, and the claimants allege that the railroad tried to prevent the coal operators from doing business.

WEST VIRGINIA

Clarksburg—The Imperial Gas Coal Co. has made application for a sidetrack at its new operation near here. The company is preparing to put in and operate a modern mining plant. The largest cash payment to be made in a coal deal here in some time was disclosed recently when a deed was filed for record at the county clerk's office transferring approximately 300 acres of the Pittsburgh vein of coal near Lumberport from the Cambria Coal Co. to F. K. Gatch for a consideration of $243,075.15. The cash payment acknowledged by the deed is $176,775.15. Eleven separate tracts of the coal lying on Ten-Mile Creek and Jones Run thereof in Ten-Mile district, and three tracts aggregating about 15 acres in fee simple on Ten-Mile Creek in the same district, are covered by the deed. The property was acquired about a year ago by the Cambria Coal Co. from the Lumberport Coal Company.

The Cambria Coal Co. has completed its tipple at its Lumberport mine and started last week to load coal. This is one of the important new operations in this field in the Clarksburg district.

KENTUCKY

Whitesburg—Severe weather conditions prevailing throughout this section has delayed construction, grade work, building and opening of mines by the coal companies starting new work. Many men are out of employment as a result, and all business seriously hampered. Many carpenters and other laborers are going into the mines as a result of the long delay in outside work.

OHIO

Zanesville—According to a circular received in local railroad circles open-top coal cars are to be furnished wagon coal mines in this vicinity in the future. This will do away with the old method of furnishing box cars for the mines and will result in the loading of more coal which will greatly assist in relieving the present coal shortage.

Bellaire—The Brooks Run coal mine located on the Brooks Run pike southwest of this city, has been sold through the James L. Linard agency of this city to B. R. Sutliff of Shadyside. The consideration was not made public but is said to be in the neighborhood of about $10,000. The Brooks Run Coal Co. employs about 25 men.

ILLINOIS

Harrisburg—The 25 coal mines in Saline County were idle four days during the week of Jan. 7 for lack of cars and on Saturday, Jan. 12, no cars were in sight. The mines average about 50,000 tons a day and the loss of output was therefore 200,000 tons. Five thousand miners were idle.

Pana—North Mine No. 2 of the Pana Coal Co. resumed operation a few days ago after having been abandoned since Jan. 27, 1914. It was made ready for reopening at a cost for labor and materials of $50,000. Repairs had been in progress ten months. A cave-in at the bottom of the shaft which left a cavern 35 ft. wide and tore out 100 ft. of casing had to be repaired. New engines and equipment were installed. At full operation the mine will employ 300 men and its output will be 1600 tons daily.

Edwardsville—Simon Kellermann, Jr., explosive license agent for Madison County, has received a ruling from the Bureau of Mines at Washington that coal miners buying powder or fuses must have a license and that merchants must not under any circumstances sell without a license.

Duquoin—Thomas Holmes, general mine superintendent of the Chicago & Wilmington Coal Co., at this place, was presented by the company with a check for $5000 on New Year's Day in recognition of his successful administration of the past year.

Marion—A suit brought by the miners of the Taylor Coal Co., operating a mine near Herrin, for neglecting to furnish the miners with a suitable washhouse was decided against the company with fine and costs. The miners contend that the tonnage of coal produced would be much heavier if the operators would show a willingness to coöperate by complying with the law.

Carterville—The Carterville Big Muddy Coal Co., operating a mine at Cambria, made arrangements with its miners that if the men would work on New Year's day the mining company would donate the entire output for that day to the Y. M. C. A. Fund. The miners agreed and as a result something like over $3000 was sent to the Y. M. C. A.

Springfield—Joseph Castagno has sued the Chicago, Wilmington & Franklin Coal Co. for $3000 for injuries alleged to have resulted from the failure of the company to mark as dangerous a part of the mine roof that was loose and rotten.

OKLAHOMA

Krebs—The Osage coal mine No. 5, was forced to close on Jan. 5 on account of damage to the large fan that supplies fresh air and draws foul air from the mine. About ten days will be required to make repairs, which must be finished before operation is resumed.

Personals

H. H. Stockett, superintendent of the Locust Mountain Coal Co. at Weston, Penn., has been made general superintendent of the Dodson interests in the anthracite field and will make his headquarters at Shenandoah.

J. F. Smith, of Knoxville, Tenn., has been given a position with the Smooth Creek Coal Co., at Roxana, Ky., as store manager and general office man. He is well known among the coal operators and retailers in east Tennessee.

P. C. Gunion has been appointed advertising manager of tne Industrial Bearings Division of the Hyatt Roller Bearing Co., Newark, N. J. Mr. Gunion has been in the sales department of the Hyatt company for two years. Just previous to his recent appointment he was manager of the Pittsburgh office.

James B. Neale, of Minersville, Penn., a prominent coal operator and assistant to Fuel Administrator Garfield, was on Jan. 16 appointed by Governor Brumbaugh a justice of the peace for Foster Township, where the mines of Mr. Neale are located. No election was held in the township to fill the vacancy.

Frank Carter, formerly connected with the Smooth Creek Coal Co., at Roxana, Ky., has accepted a position as store clerk for the Red Ash Coal Co., at Red Ash, Ky. Mr. Carter was also former mine man at the plant of the Whitley Elkhorn Coal Co., at Sergent, Ky. He is popular among coal operators in eastern Kentucky.

H. A. Cochran, general coal freight agent of the Baltimore & Ohio Railroad Co., at the request of United States Fuel Administrator Garfield has been granted a temporary leave of absence in order that he may assist G. N. Snider, transportation adviser to Dr. Garfield, in coördinating with the Director General of railroads the transportation requirements of the United States Fuel Administration.

E. B. Sutton, who has been in charge of the Federal mine-rescue station at Birmingham, Ala., for the past four years, has tendered his resignation and will enter business at Elkins, W. Va. Mr. Sutton is considered exceptionally well versed in mine-rescue work and his departure from the district is regretted. W. T. Burgess, assistant engineer, will be in charge of the local station until Mr. Sutton's successor is named.

Robert Z. Virgin, of Wheeling, W. Va., has resigned his position as superintendent of the mines of the Wheeling Steel and Iron Co. to accept a chair in the College of Mines and Mining of West Virginia University at Morgantown, W. Va. Mr. Virgin entered upon his new duties Jan. 15. Before coming with the Wheeling Steel and Iron Co. he was superintendent for the Cambria Steel Co. at Johnstown, Penn., and was identified with several mining operations in Somerset County, Pennsylvania, and West Virginia.

E. A. Holmes, a well-known coal salesman of Birmingham, has been appointed district representative of the National Fuel Administration to handle the distribution of all priority and Government business apportioned to this district. This appointment is the initial step in placing in operation the plan of distribution suggested by the coal operators' association, and will enable the district to care for priority shipments with the least possible interruption to the movement of coal to essential industries and public utilities, such order being placed wth mines which are not overly burdened with the above class of business.

Obituary

William Harrison, mine examiner at the Summit Mine, near Belleville, Ill., was killed in an explosion which wrecked the municipal electric-light plant at Swansea, a Belleville suburb, last Saturday night.

Nicholas Moyer, Locust Gap, Penn., the oldest breaker foreman in the anthracite region, died, Jan. 9, aged 80 years. He was foreman at the Locust Spring colliery breaker for 40 years and declined to be placed on the pension rolls.

W. H. Thomas, a well-known operator, and president of the McDowell Coal and Coke Co., died at Bramwell, W. Va., recently at the age of 54 years. He was formerly from Columbus and engaged in operations in the Hocking Valley for 12 years.

Marcy MacDonald Price, aged 48, vice president of the Hartland Collieries Co., with operations at Hartland, W. Va., died on Jan. 9 of pneumonia. Mr. Price was one of the best-known men in the coal business in the eastern part of the United States. He is survived by his widow, two brothers and two sisters.

Christopher W. Levalley, founder and chairman of the board of directors of the Chain Belt Co., died suddenly of heart fail-

ure at his home in Milwaukee on Friday, Jan. 4. In 1907 Mr. Levalley conceived the idea of driving a concrete mixer with a steel chain and using a cast semi-steel drum. These ideas were incorporated in what was known then as the Chain Belt mixer, but which name has since been changed to Rex mixer. Mr. Levalley would have been 83 years old in April had he lived. From 1891 until 1916 he was president and general manager of the Chain Belt Co. In 1916 he was elected chairman of the board of directors and held his position up to the time of his death. He was also interested in the C. O. Bartlett & Snow Co. of Cleveland, and the Federal Malleable Co. of Milwaukee.

Industrial News

York, Penn.—A number of business men, headed by J. F. Riest, F. H. Brubaker, and C. B. Yost, have bought the Louise Coal Co., with a 600-acre property in Bedford County and Fulton County, and have organized the Lenora Coal Co., with $600,000 capital.

Buffalo, N. Y.—The Pittsburgh coal shippers, B. Nicoll & Co., who have maintained an office here for several years, have discontinued it on account of the peculiar condition of the coal business. Thomas B. Dunbar, the representative, has returned to the home office.

Cincinnati, Ohio—The Himyar Coal Corporation, of Perry County, Kentucky, has filed in the United States Circuit Court of Appeals its appeal from the judgment of the district court for eastern Kentucky awarding to Vernon Lawson, a miner, damages of $5000 for injuries said to have been sustained while in the company's employ.

Jefferson City, Mo.—State Fuel Administrator Crossley has appointed the following to compose the State Fuel Advisory Committee; W. K. Kavanaugh, St. Louis; H. A. Buehler, Rolla; John R. Kirk, Kirksville; Houck McHenry, Jefferson City; R. T. Wood, Springfield; John T. Barker, Kansas City; Louis B. Houck, Cape Girardeau; D. R. Frampson, Moberly.

Columbus, Ohio—B. F. Nigh, secretary of the M-O-I Coal Association, in a report covering the month of December shows that a total of more than $4300 was collected for the members through the claim bureau. This is the largest sum ever collected during one month since the establishment of the bureau. During the month a total of 41 new members were received.

Columbus, Ohio—It is estimated by figures of operators that car and labor shortage, the latter incident to the holidays, caused a loss of 600,000 tons in coal production in Ohio during the last week of December. W. D. McKinney, secretary of the Southern Ohio Coal Exchange, places the loss in the field embraced by that organization at 48.86 per cent., or 198,000 tons.

Columbus, Ohio—The purchasing agent for the Ohio Board of Administration, which controls 25 state institutions, announces for the first time in several months that operators have been offering to sell fuel to the state. One company offered tonnage in any quantity required and others offered large amounts. He regards this an indication that the situation is improving.

Columbus, Ohio—W. D. Ranney, Columbus Smoke Inspector, is having his troubles because of the poor quality of fuel used by many factories and business houses. He claims that it is impossible to enforce the rigid smoke restrictions to keep Columbus a spotless town. He further states that many Columbus factories are working 24 hours daily, which vastly increases the volume of smoke.

New Philadelphia, Ohio—The Brown Coal Mining Co. has increased its capital from $20,000 to $40,000.

Terre Haute, Ind.—Articles of incorporation have been filed with County Recorder John T. Grace by the Riley Coal Co. The capital stock of the company is fixed at $10,000. The directors for the first year are Charles T. Kintz, James Drum and Pius F. Kintz, all of Vigo County. The principal place of business of the firm will be Terre Haute.

Raton, N. M.—The Superior Coal Co., of Raton, N. M., is in the market for a second-hand storage-battery locomotive, with a dozen nickel-iron batteries, preferably Jeffrey make.

Belle Vernon, Penn.—Government agents, continuing their drive against coal men charged with profiteering, arrested Joseph W. Vance and E. F. Wilson, coal operators in Fayette County, trading as Vance & Wilson. They were released in $1000 bail for a hearing. There are now seven coal operators and brokers of this vicinity charged with profiteering, and at least eight more arrests are expected.

St. Louis, Mo.—The fourth annual banquet and entertainment of the St. Louis Coal Club was held last Monday night, at the American Annex Hotel. Lieut. Gov. Wallace Crossley, Missouri fuel administrator, spoke on "War and Coal." John P. Reese, vice president and general manager of the Superior Coal Co., spoke on "The Relation of Government-Controlled Railroads to the Coal Industry."

St. Louis, Mo.—Plans for four towboats and 24 barges to be built for the Government at a cost of $5,360,000 and operated on the Mississippi River between St. Louis and St. Paul, have been prepared in the office of the United States Engineers here. Bids will be opened the latter part of this month and construction will be rushed. The barges have been designed to carry coal, ore, steel, cement, lumber and oil. They will be 300 ft. long, 48 ft.-beam and 10 ft. depth.

Pittsburgh, Penn.—What is believed to be a move by the stockholders of the First National Bank of Uniontown to regain control of the institution of which Josiah V. Thompson was the president, was made in the United States District Court on Jan. 11 when former Judge Robert E. Umbell, representing creditors and stockholders, asked the court to set aside the order granting John H. Strawn, receiver, power to sell the real and personal property of the bank.

St. Louis, Mo.—Reports that efforts were being made to have St. Louis and Missouri placed in the Chicago fuel district raised a storm of protest, and Fuel Administrator Crossley of Missouri and Chairman Nims and C. E. Morrow of the St. Louis Fuel Committee hurried to Washington to resist such action. The Chamber of Commerce took a hand and Mayor Kiel sent a telegram of protest. Word came from Washington that the opposition would prevent the carrying out of the plan.

Huntingdon, Penn.—Twelve carloads of bituminous coal from the Huntingdon and Broad Top R.R. siding here was seized on Jan. 7, by E. M. Greene county fuel administrator, to relieve the shortage in Huntingdon County. More than 1000 loaded cars are now said to be on sidings of the Huntingdon and Broad Top R.R. and the accumulation is constantly increasing while it is waiting for the Pennsylvania R.R. to take over its shipments to New England and other parts of the East.

Clayton, Mo.—Chairman Hodgdon, of the St. Louis County fuel committee, at a meeting of 75 coal dealers of the county warned them revocation of license would be the penalty for failure to make daily reports. After the meeting the dealers organized the St. Louis County Fuel Dealers' Association. The association will ask the Government to put into effect as quickly as possible a uniform freight rate in the county. They complain that one road is charging 75c. for switching a ton of coal two miles.

Pittsburgh, Penn.—Notwithstanding the statements by many Government officials to the contrary, there has not been a great deal of improvement in the coal-car or coal situation in this district. The extremely cold weather is probably responsible for a considerable part of the condition. The rivers are frozen solid and river loading out of the question.

The Baltimore & Ohio mines in Somerset County have been particularly short of cars, except some that have been getting some western Maryland cars.

St. Louis, Mo.—Payment of dividends aggregating $40,000 in six months by the new Staunton Coal Co., of Livingston, Ill., to the Mercantile Trust Co., of St. Louis, on the $50,000 stock in the company held by the estate of George Lincoln Sands has been brought into question by proceedings begun in the Circuit Court at Edwardsville, Ill., by Public Administrator Frank B. Sanders of Madison County. He contends that the dividends on the stock of an Illinois mine should have been retained in Illinois for the payment of creditors and for settlement of the inheritance tax.

Cincinnati, Ohio—The Matthew Addy Co., of Cincinnati, sued by J. A. Hinchey and others, doing business as the Gem Collieries Co., has filed its answer in the United States District Court, denying the allegation that it delivered contract coal intended for delivery to plaintiffs at Chicago and sold it in the open market. The Addy company admits the agency connection, but charges that the plaintiffs themselves broke the contract, and failed to supply coal contracted for, causing actual cash damge of $1775, and additional damage to the company's good will amounting to $10,000, for which judgment is asked.

Clayton, Mo.—Sam D. Hodgdon, chairman of the St. Louis County fuel committee, will recommend to the Fuel Administration that railroads be forced to pay the same demurrage for shipments of coal detained by them that is charged consignees. The State Public Service Commission recently promulgated an order increasing demurrage charges, effective Jan. 21, as follows: After 48 hours, first day $3, second day $4 and each additional day $1 until the demurrage reaches $10 a day. Hodgdon asserts that nineteen cars have been standing on tracks near University City for eight days and that several cars have been at Kirkwood seven days.

St. Charles, Mo.—Prices fixed by R. M. Thomson, chairman of the St. Charles County fuel committee, approved by State Administrator Crossley, are as follows: Illinois, group No. 1, including Belleville, Freeburg, Coulterville, Glen Carbon, Litchfield, Logan, Marissa, Mount Olive, New Athens, Pinckneyville, St. Clair, Tilden, Wilderman and Winkle, $5.50 a ton delivered; group No. 2, including Duquoin, Paradise and Sunfield, $5.55; group No. 3, including Murphysboro district, $5.62; group No. 4, including Benton, Carterville, DeSoto, Eldorado, Gallatin, Marion and West Frankfort, $5.65. The prices for St. Charles County have not been determined.

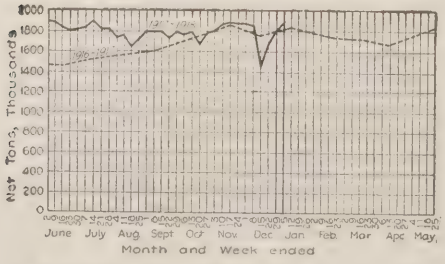
Birmingham, Ala. — Announcement is made of the acquisition by G. H. Stevenson and associates, of Bessemer, Ala., of the Bamford mine, located in Shelby County, about 21 miles south of Birmingham on the Southern Ry. This is a slope opening on the Gould seam of coal and has not been operated for a number of years. The deal covers about eighty acres of fee simple coal lands and all plant and mine equipment. It is understood the new owners will resume operations at the mine as soon as the necessary rehabilitation has been completed. Options are reported to have been taken on the adjoining eighty acres of coal lands by the Bessemer Coal, Iron and Land Company.

Baltimore, Md.—Directors of the Consolidation Coal Co. at their regular meeting on Jan. 11 cut a melon for the stockholders in the shape of an extra dividend of 3 per cent. The regular quarterly dividend of 1½ per cent. was also declared payable Jan. 21, to stockholders of record on the 22d. The extra is payable Feb. 11 to shareholders of record at the close of business Feb. 1.

No statement of earnings was issued at the conclusion of the meeting. It is generally known, however, that earnings for year were highly satisfactory. The company would have shown a big increase in coal production at its mines in West Virginia. Maryland and Kentucky had the car situation to the mines been adequate. The Consolidation, however, like other companies suffered from a car shortage.

Columbus, Ohio—The Coal Shippers' Terminal Pool Association, which is now in operation in most of the large centers of population in the Middle States, has adopted a system of classification of various grades of coal which is set forth in a pamphlet. Only three grades of coal are recognized by the pool managers—namely, lump, mine-run and screenings. Pittsburgh No. 8 vein and the Cambridge district are placed in one classification. Another classification is given to the Middle District in Ohio, Coshocton and Bergholtz. Another is given to Deerfield and Massillon districts and another to the Hocking Valley, both thick and thin vein and Pomeroy Bend. Separate pool numbers are given to Jackson, No. 8 stripping, and wagon mines. West Virginia grades are divided as follows: Pocahontas and New River in one classification; Fairmont steam and domestic in another classification and separate pool numbers are given to Fairmont gas, Kanawha steam and domestic, Kanawha gas, Logan County steam and domestic, Logan County gas and smithing. Classifications are also made for western Pennsylvania and Kentucky grades.

MARKET DEPARTMENT



GENERAL REVIEW

Cold wave sweeps country, interfering greatly with transportation, increasing coal consumption and decreasing receipts. Shortage most pronounced in the East, while certain Western localities appear to be fairly well supplied.

A cold wave—the coldest for the season in many years—descended on the country, particularly the region west of the Alleghenies during the week under review. The low temperatures were accompanied with high winds and in some localities heavy snows. This tied up railroad transportation to a considerable degree, and while causing an increased consumption, particularly of domestic fuel, rendered receipts much lighter than normal. The suffering in some localities was intense. Along the Atlantic seaboard in particular the movement of coal was considerably hampered by ice in the rivers and harbors. Baltimore, New York and Boston have been and are still suffering in no small degree from this cause, while Hampton Roads is not without its troubles of a similar nature. Of course, the cold weather exerted an adverse effect on production, and many mines worked only part time, and in many cases only partly manned because of the storm. Conditions in New England, while probably no better, or but slightly so, than a week or two ago, are probably no worse. The priority order granted this territory of 500 cars per day of bituminous coal is certain to have its effect sooner or later, but this effect can not be expected immediately. On the other hand, it is believed in some quarters that the diverting of this coal to New England will adversely affect industries in New York, Pennsylvania and some of the other Eastern states, and considerable protest is heard concerning it. It would appear that domestic shortage has been in many instances considerably relieved. In some localities, however, added inconvenience and no small amount of suffering was caused by the severe weather conditions. The improvement in transportation, which was being shown in some of the coal producing districts was, of course, nullified by the cold wave. It is believed, however, that as soon as the weather moderates for any length of time the transportation tangle can be largely straightened out, and this will doubtless, at least in large measure, relieve the present stringency. The drastic rulings of the Fuel Administration concerning coalless days may also exert a more or less potent influence in this direction.

COAL PRODUCTION

The production of soft coal during New Year's week is estimated as 9,236,000 net tons, an increase over the week of Christmas of 322,415 tons, or 3.6 per cent. The average production per working day was 1,847,000 tons. If allowance be made for the holiday, the rate of production has thus returned almost to the level of early December, before the severe weather began to impede operations. The total production

of beehive coke during the week ended Jan. 5, is estimated as 515,000 tons, an average per working day of 103,000 tons. Preliminary estimates place the production of beehive coke in 1917 at 34,000,000 net tons, a decrease of 1,460,000 tons, or 4.1 per cent., when compared with the production for 1916. Shipments of anthracite reported by the nine carriers amounted to 27,517 cars, as compared with 36,083 cars during the week before Christmas. Losses in output due to observance of the holidays appear to have been larger in the anthracite industry than in either bituminous mining or coke manufacture.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Dec. 15	Dec. 22	Dec. 29	Jan. 5
Bituminous shipments, 114 roads..	149,122	177,599	158,596*	164,345†
Anthracite shipments, 9 roads...	31,672	36,083	29,476*	27,517†
Beehive coke shipments, 4 roads...	10,335	11,835	10,211*	10,572†

* Revised from last report. † Subject to revision.

Atlantic Seaboard

BOSTON

"Non-essential" industries shut down in large numbers. Shipments of bituminous diverted to hospitals, pumping stations, and to some extent for household use. Railroads and power companies on narrow margins of supply. Emergency deliveries in sight and probably not sufficient to keep war order plants running, except possibly those rated 100 per cent. No bunker coal in Boston and ship departures delayed. Schools still closed. Expected another week will disclose much additional suffering.

Bituminous — New England people are now fully alive to the coal famine. The fact that the fuel administration has been able to get emergency shipments has encouraged hundreds of steam-users to apply for the relief that on account of the extraordinary situation can be had only in sparing amounts. The prolonged cold spell beginning near the end of December almost completely tied up coastwise shipping and when to this is added the long delays in dumping coal at the piers and the extreme slowness with which all-rail shipments are coming through it can be seen how critical the situation is. There have been periods before when transportation has been delayed, but never has there been a time when in proportion there was so little fuel in reserve. Large mills that are accustomed to carry heavy stocks accumulated during the summer have been facing the winter with coal for only a few weeks, and now in many cases have had to shut down until coal can be had in sufficient volume to permit steady operation. The mill situation in Fall River is partcularly serious. The American Printing Co. plants and other large textiles have had to close, throwing out of employment several thousand hands.

The railroads, in particular, are running on much smaller reserves than in ordinary times would be considered safe, and already there have been several instances of seizure for locomotive supply. The power given state fuel administrators also to commandeer coal in transit adds another uncertainty to the consumer who is dependent upon coal en route to keep him in business. On Jan. 10, 120 cars of bituminous were seized by the New England Fuel Administrator for the relief of Boston and Lynn where retailers were without enough coal to heat the hospitals and pumping stations over Sunday, not to speak of heating apartment houses and public buildings. The schools in most of the cities have not yet reopened, nor are they likely to until coal arrives in far greater volume than at this writing.

Of the emergency cargoes started for New England but two have thus far reached destination, the "Achilles," 12,777 tons, and the "Newton" about 7400 tons. This coal was carefully apportioned by the fuel administration, almost every part of New England being represented in the consignments. Coal was sent from these ships far into Maine, New Hampshire and Vermont, for hospitals and for other imperative needs, as well as to Rhode Island for hospital use there. The "Achilles" was diverted from a Panama R.R. consignment, and the "Newton" brought some of the coal that was diverted from Western consignees at one of the congested railroad points. The latter ship was stuck in the ice in the Chesapeake 10 mi. or so south of Baltimore and delayed two or three days.

Six barges are en route for the fuel administration, but the aggregate tonnage is only 10,000 and movement is so slow their early arrival cannot be relied upon. There are steamers, however, that will be coming along and will help supply the more immediate requirements. The arrival of cargoes for account of the usual wholesale factors will help the most, however, and a week of good enough weather to permit the dispatch of such cargoes is sorely needed. It should be stated that more than 100 bottoms are still waiting at Hampton Roads for coal.

Anthracite—For 10 days practically the only supply of domestic sizes reaching this market have been in trains rushed from the mines to meet the emergency. At least one train-load has been diverted from Camp Devens, and direct from several of the operating companies have come solid trainloads for distribution from points like New Haven, Worcester, Providence, and Boston.

The hard coal famine is certainly acute and cannot possibly be met by such waterborne cargoes as are likely to be shipped. The New England Fuel Administration has at least one steamer, 3500 tons, which is due in Boston during the current week.

Regulations have been put forth limiting the hours during which business establishments, theaters, and other buildings may be open. Saloons are not to open until 9 A.M. and are to close at 10 P.M. and several other drastic rules have been made by the fuel authorities, all in the effort to promote economy in the use of coal.

NEW YORK

Demand for anthracite continues heavy with supplies scarce. Fuel authorities work hard to relieve situation. Appeals made for more coal and local coalmen appear before the Washington authorities. New England gets percentage of local receipts although situation there is not believed to be as desperate as local needs. Harbor crowded with ships.

Anthracite—That the district dependent upon this market for its supply of anthracite has not experienced the worst fuel famine in its history can be attributed entirely to weather conditions. These while not at all mild, were considerably better than they have been and permitted a reasonably good movement of coal. While those in charge have put forth their best efforts to secure sufficient coal for the daily requirements of the market and have partially succeeded, the supplies have been far short of the demand and the outlook is not at all promising notwithstanding the hopes held out.

Even though the reports issued by the various agencies show that there are many thousand tons of coal at the various loading terminals on the New Jersey side of the river and bay, they mean little to those dependent upon getting coal when it is impossible to move it across the water because of the heavy ice floes which have hindered shipping greatly the past week.

In their petition protesting against an order closing the theater and moving picture houses, the theatrical managers state that if the 118 foremost places are closed the saving in coal will amount to less than 163 tons of coal a day while the Government will lose about $11,800 in taxes for each day's closing.

The shortage of fuel has resulted in an almost general closing of schools in Brooklyn. Owing to a decided difference in the prices submitted by the Brooklyn and Manhattan retail dealers for furnishing and delivering coal for the schools in their respective boroughs, the Board of Education did not close contracts for the full requirements for the Brooklyn schools with the result that there are comparatively few of the schools in that borough now open.

Considerable coal has been lost as a result of the heavy ice breaking the barges and causing them to sink.

Existing conditions are driving the gas companies to their maximum capacity, the daily output showing an average daily increase in consumption of about 30,000,000 cu.ft. over normal conditions. The Astoria Coal and Coke Co., a subsidiary of the Consolidated Gas Co. has disposed of many thousand bushels of coke at its plants, each customer being limited to one bushel.

In the wholesale district there are no immediate prospects held out. Most of the

dealers are without supplies and some say they do not know when they will have any. Their offices are continually visited by retail dealers who want coal. All of the domestic sizes are scarce, pea being as hard to get as any other. The steam coals are tightening and the down town office buildings are saving heat wherever possible.

The retail situation is serious. Few if any of the dealers have coal in their yards, invariably delivering direct from the barges to the customers' bins or else taking a load to the yard and selling it direct to customers who carry it home in every sort of receptacle.

Current quotations, per gross tons, f.o.b. Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck	4.30@5.00	5.50@6.00
Rice	3.75@3.95	4.50@5.00
Barley	3.25@3.50	3.50@4.00
Boiler	3.50@3.75	

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—A delegation from the Wholesale Coal Trade Association of New York journeyed to Washington the latter part of the week in an effort to obtain certain concessions for the trade. W. A. Marshall and C. C. Marshall, members of the delegation and directors of the association were witnesses before the Senate Committee investigating the coal situation after which the delegation were granted an audience by Fuel Administrator Garfield. On Tuesday of this week many members of the association with others who are not members went to Philadelphia to attend a meeting of the operators association at which vital matters affecting the trade, such as the installation of a zoning system and the distribution of central Pennsylvania coals were discussed.

The local situation continues serious. Supplies are short and while large quantities of coal are reported as arriving at this Tidewater much of it is used in supplying vessels with bunkering fuel. Frequently inability to secure fuel at this harbor has caused ships to go to the Southern ports, secure their fuel supply and then return here for their freight cargo. This has been the case within the past week. While reports show the arrival of large tonnages of bituminous coal at the loading terminals, the diversion of about one-fourth of the receipts to New England and the tonnage required for bunkers leaves comparatively little for local consumption.

Late Wednesday night the national fuel administration made public drastic regulations calling for five coalless days, Jan. 18-22, inclusive, and every Monday thereafter until Mar. 25. This regulatory measure, applies to all the country west of the Mississippi, and promptly met with a storm of protest. If this ruling is enforced, it may tend to clean up congestion on the railroads, but will cause the loss of immense sums in wages, etc.

Demand for bituminous has increased with the decreased anthracite supply and while the city ordinances forbid the use of bituminous except under restrictive conditions, the ordinances are being practically ignored during the present emergency the city using bituminous coal whenever anthracite is not available.

The local fuel administrators have let it be known that New York shall not be discriminated against in the placing of orders curtailing consumption of coal and that because New York supplies about 15,000 tons of coal a day to ships it is no reason why its industries shall be shut down while other Atlantic cities are excepted. It was the belief here that the New England situation was less desperate than New York's and that more coal should be diverted to this port to relieve local conditions.

PHILADELPHIA

Anthracite extremely short. Cold weather returns. Bituminous production critically short. Car supply again poor. Interesting contract situation.

Anthracite — After experiencing a comparatively mild spell of weather, zero conditions have once more returned and the wild scramble for coal is being repeated. As a consequence the city experienced another exciting coal week, but one would find it difficult, though, to judge actual conditions from the daily press. Early in the week the newspapers said there was so much coal en route to the city that all danger had passed. When the coal did not arrive there was another great scare, and reports of all kinds of altercations with the coal administration appeared.

There has been much discontent recently among the local operators because coal has been moved in immense quantities to New England, while Pennsylvania, with its extensive munition plants and other essential industries is in such dire need. They feel it is a rank injustice on the part of the national authorities directing that 500 cars a day be sent into the above territory. In addition it was reported that 750 cars had been seized in a single day west of Harrisburg and diverted to New England.

Probably the most striking incident of the week was the advance of 75c. a ton in the prices of the M. A. Hanna Co., successors to the Susquehanna Coal Co. Prior to Jan. 9 this company had been marketing its product at the company prices. This company is now classed as an individual shipper, and the officers claim it was an oversight that they had ever been listed otherwise by the Government. Customers were asked to signify their desire as to continuance of shipments under the new schedule. Of course, everybody asked that their orders should be kept intact regardless of price.

The steam coal trade has tightened up noticeably and among the individual shippers the prevailing price for buckwheat is $4.15, while $3.50 can be had for rice and barley, even. Culm has assumed greater activity than ever and while heretofore it has been necessary for the shippers of this material to conduct a campaign of education to induce manufacturers to use it, orders now frequently come unsolicited, with most sales still made around $1.25@1.50.

The prices per gross ton f.o.b. cars at mines for line shipments and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—The outlook for increased bituminous production is far from encouraging. It is true that early in the week the car supply was greatly improved and it began to look as though Government control was about to develop the promised relief, but the supply immediately fell off and is now almost as bad as ever. The central Pennsylvania mines report being closed in numerous instances 50 per cent. of the working time, while from the Fairmont district the report on one particular day, which is said to be a fair average for the week, was that 68 mines out of a total of 139 were shut down from the same cause. With the few cars that are being received the miners are loading them to their capacity and beyond.

The contract situation is an interesting one, since all agreements must now be approved by the Government and executed at the fixed price of $2.45 per net ton. There is a lack of willingness on the part of the operators to enter into new agreements, while consumers hesitate to have their contract scrutinized in this way for fear of losing their entire supply on account of being in a non-essential line. In the meanwhile most shippers have notified their customers they will use their best efforts to take care of them at the fixed price.

BALTIMORE

Fuel situation here continues desperate, with industries at times down to a few hours' supply. Hard coal practically out of the market in many sections.

Bituminous—When a big city sees its important industries and public service corporations at times with but a few hours' supply of fuel on hand, when it sees even its high pressure fire service several times without enough coal to keep running 12 hours, when apartment houses, homes and even big hospitals went without fuel for hours, the desperation of the fuel situation is forced home. With cold weather here in earnest the demand for fuel became the more insistent. Only the efforts of the local fuel administrator, who the week before had diverted 200 cars of soft coal from the pier accumulation to domestic needs here, saved the situation for a time, and again the past week 100 cars were diverted at Brunswick and distributed to urgent cases. One of the largest hospitals that had been without heat or light was taken care of therefrom, as was the fire service.

Anthracite — Hard coal shipments here are absolutely inadequate to meet even the urgent demands. The fuel administrator has advised domestic consumers to turn to soft coal for relief, but even that is hard to get. The administrator admits that there is little hope of hard coal relief in the near future.

The small supplies reaching here are being distributed grudgingly in half ton, or even bushel lots, to the most urgent cases. After the failure of hard coal supplies in many sections, soft coal depots were opened in a number of school yards where coal was sold at 18c. a bushel to prevent many poor families from actually freezing in their homes.

Lake Markets

PITTSBURGH

Improvement in transportation set back by blizzard. Mill supplies fair.

Coal operators continue to insist that the whole matter of coal supply resolves itself into a question of transportation. Conditions in this respect improved somewhat towards the close of last week, but the blizzard in the central West Saturday froze up the railroads badly, interrupting even passenger service, and while the weather has been moderating recently the net result is no improvement in the week. Such improvement as occurred last week was due to the railroads declaring general embargoes against the receipt of freight, a few commodities being excepted, including coal.

Local supplies are only fair, but the city is handicapped by the fact that normally it receives considerable coal by water, and the Monongahela River has been frozen over for about a fortnight. The Pennsylvania and Continental pipe works, which use river coal, are closed entirely, and some other mills have run short. In the Mahoning and Shenango valleys the mills have been getting slightly better coal supplies, and the bessemer department of the Republic Iron and Steel Co., which was idle for three weeks from lack of coal, has been in operation since Jan. 2.

Arrests continue of coal operators and dealers on charge of violating the rules under the Lever act, and there is no intimation as to how much farther the authorities intend to proceed. Most of those arrested are held for the March term of the United States Court at Erie.

Only occasional lots of free coal can be picked up in the market but it is believed that offerings will be decidedly heavier as soon as production increases, as a moderate volume of contract business ran out with the old year. The market remains quotable at $2.20 for slack, $2.45 for mine-run and $2.70 for screened, per net ton at mine. Pittsburgh district, with 15c. permitted to be added in the case of sales by jobbers.

BUFFALO

Situation steadily growing worse. Must come to a climax before the effects of the late storm are worked off. Bituminous scarcer than anthracite. Coal moves in preference to passenger trains.

Bituminous—The worst seems to be close at hand now. Nobody expects to be able to escape the consequences of the storm of the 13th, which hit Buffalo especially hard from the fact that this section was visited by an 84-mile gale, added to temperature below zero. It was the gale that did the mischief, tying up trains and other business as even deep snow would not. If the heavy snow fall promised had taken place the city would have collapsed. As it was the weather held back even the anthracite trains, so that about two days were lost, with every consumer burning all the coal he could get.

Coal shippers and large consumers are up in arms on account of the order from the fuel administration, diverting coal from such roads as the Buffalo, Rochester & Pittsburgh and the Buffalo & Susquehanna, naturally tributary to Buffalo and sending it to New England. A large delegation went to Washington to protest, but no great amount of satisfaction appears to have been obtained. Some of the complainants refused to say anything on their return.

There is intimation now that the fuel authorities will advance the bituminous prices soon, but till then the regulation prices remain as follows, per net ton f.o.b. Buffalo:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.80	4.20
Allegheny Valley	3.70	4.10

Anthracite—The great storm, though mostly snowless, has tied up the train and city service so that deliveries are again slow. But it is promised that the trains stalled on the way will be rushed in and the lead on consumption held. This city is so near the mines that delivery is a matter of but a day or two at the worst, unless unforeseen and unavoidable delays are suffered.

The complaint of no coal is now aggravated by the running short of natural gas, which always deserts the consumer when it is most wanted. This is now a matter of so small supply that all sorts of shifts have to be made to get on till moderate weather returns. And all this when we had every reason to expect a mild winter, since we had had two hard ones in succession. Candian retailers throng the city, but it is small comfort that can be afforded them.

TORONTO

Coal situation much improved by arrival of large shipments. Railway embargo raised. Dealers resume taking orders. City fuel depots discontinue business.

The coal famine which was severely felt during the bitterly cold weather of the first week of January was relieved by the arrival of large shipments of coal on the 5th and subsequent days followed by considerably milder weather. The raising of the embargo placed by the N. Y. Central on shipments of coal via the Michigan Central has resulted in partially overcoming the congestion at Black Rock. Dealers have resumed taking orders and are making deliveries in ton and half-ton lots. The city fuel depots are filling the orders booked but now that the emergency is over will take no more.

Quotations for best grades per short ton are as follows: Retail, anthracite egg, stove, nut and grate, $9.85; pea, $8.85; bituminous steam, $9; slack, $8 to $8.50; domestic lump, $10; cannel, $11. Wholesale f.o.b. cars at destination. Three-quarter lump, $7 to $7.50; slack, $6.85 to $7.

DETROIT

Temperature 16 deg. below zero early in the week increases hardship of domestic consumers without coal. Citizens urge state and local fuel administrators to take more decisive action.

Bituminous—Further serious complications have been injected into the local coal situation by a blizzard with a 60-mile gale and temperatures dropping as low as 16 deg. below zero. Heavy snowfall, heaped into heavy drifts Saturday and Sunday, completely disorganized transportation schedules, causing serious curtailment of receipts of coal from all districts. With a large proportion of the domestic consumers being carried along on temporary and small allotments and no reserves at hand from which to draw, while the severity of the weather necessitated increased consumption, the effect of the storm was to aggravate severely the troubles of those without coal supply.

Owing to the extremely cold weather drivers for retail coal yards practically discontinued deliveries Saturday and Sunday. More than 600 applications for fuel were received Saturday by the police department which is handling distribution for the local coal administrator. With some 1600 applications previously booked and several hundred added Sunday, the storm left the department a stupendous volume of applications and but little coal, with which to supply them.

For several days preceding the storm, inbound shipments of bituminous coal maintained a volume of about 700 cars a day, but the absence of the usual reserves transformed these shipments into merely a day-to-day supply.

Anthracite—Very limited quantities of anthracite were finding their way into the city before the blizzard, but the supply, which was then inadequate, has been largely interrupted as the result of subsequent transportation troubles. Many domestic consumers, whose heating plants are constructed for use of anthracite have been unable to obtain hard coal and have been attempting to substitute bituminous, with only partial success.

Hopes are still centered on action by the Federal fuel administrator and the director general of railroads, which it is believed is the only thing that will alleviate present suffering and prevent even greater hardships in the near future. Many industrial plants are facing the probable necessity of having to suspend work within the next few days.

COLUMBUS

The continued cold weather has caused a rush of orders for both domestic and steam grades. The situation in Ohio is improving slowly, contingent upon milder weather soon. Little actual suffering reported.

Zero temperatures, coupled with strong winds, have been playing an important part in the coal trade in Ohio during the past week. Demand from domestic users is strong and urgent calls are received by the Ohio Fuel Administration from every part of the state. Available supplies are apparently sufficient for the present but with cold weather continuing with accompanying bad effect on railroad transportation, it is doubtful if the situation can be maintained as at present.

Retail stocks are small, but valiant work by county committees and railroad traffic managers has kept the supply equal to the necessary demand. Dealers are still following the policy of only delivering a small load to each consumer. The icy condition of the streets has hampered deliveries and many consumers are hauling their own supply, which can be secured at almost all yards. Schools and hospitals are now pretty well supplied with a small stock, but none have been able to accumulate fuel. Few cases of actual suffering have been reported, but that condition is not far off if the present low temperatures continue. One of the best features is the fact that the natural gas pressure has been fairly good in all places where it is generally used as domestic fuel.

The steam business is as strenuous as the domestic trade. Many steam plants have been compelled to curtail operations because of lack of fuel. This is especially true of factories engaged in manufacturing what is styled non-essentials. Few steam plants have been able to accumulate a surplus of fuel.

The transportation on certain roads has been improved. This is especially true of the Hocking Valley, which has been giving a good car supply. Other roads such as the T. & O. C. and the K. & M. are not well equipped with cars and mines on those lines are curtailed in their production. In eastern Ohio the output has been estimated at 65 per cent. Massillon and Cambridge produced about the same amount. In other districts the output is estimated at 75 to 80 per cent. of normal.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

The coldest weather of the winter, with a heavy snowfall, has increased distress and emphasized the continued coal shortage and the transportation tangle. Relief is sporadic and inadequate.

The vigorous but relatively unsuccessful efforts of state, Federal and local authorities, coal operators and distributors and the railroads, all working together, to relieve the dangerous coal shortage existing here and all through Ohio, were virtually brought to naught by a blizzard on Friday night and Saturday, accompanied by a sudden drop of 40 deg. or more in temperature, from around 30 deg. above to 10 below zero. Some points in this vicinity reported unofficially that temperatures as low as 24 deg. below had been experienced.

The weather was much the most severe of the winter, although the storm was in general a striking parallel to that of a month ago. The same general results followed in the shape of increasing difficulty of moving trains carrying coal, as well as other commodities, in the face of an enormous increase in demand for fuel, as the case always is when sudden severe cold occurs. This time, however, the bad weather of the entire month of December and of early January had exhausted all available supplies of coal, and there had in the interim been no opportunity to accumulate reserves, served to make the situation even more distressing than formerly.

Every effort is being made to take care of the public so as to prevent suffering, but the simple fact is that there is not enough coal to go around, even with many factories and other large consumers shut down.

BIRMINGHAM

Low temperatures intensify shortage and at same time cripple production. Field representative appointed by fuel administration to handle district distribution.

On account of the lowest temperatures for many years, prevailing throughout the South for several days the past week, zero weather being recorded in Birmingham and vicinity, the domestic coal situation again became grave and resulted in much suffering. Locally, practically every dealer received increased shipments over previous weeks, but on account of the frozen and slippery condition of thoroughfares deliveries were greatly handicapped and in many cases it was impossible for householders to secure drays or any other conveyance by which they could get the coal from the yards to their homes.

Cities and towns throughout the state reported empty yards, but through the efforts of the state fuel administrator and Governor Henderson temporary supplies were arranged for all sections where suffering was reported, and while the shortage was more keenly felt than at any previous time this winter, less difficulty was experienced in diverting coal to points where the shortage was critical, than heretofore. Coal was reported seized in the railroad yards at Huntsville, and this method of relief was doubtless adopted in other localities.

Industrial plants and public utilities continue to operate on low margins of supply of steam coal. Public schools in a number of cities and towns have temporarily suspended in order to conserve the fuel supply. The steam situation is just as bad or worse than the domestic, but of course the human element in the latter causes it to take precedence when weather conditions are severe.

The appointment of E. A. Holmes, a local coal salesman, to direct the distribution of the district fuel supply has met with the hearty approbation of coal men and is considered the most-important and far-reaching step yet taken by the fuel administration in systematizing the distribution of coal and the allotment of priority orders, which will be in the hands of one thoroughly familiar with conditions at the mines throughout the district, who can place such business with producers who can handle it with the least delay and confusion.

Operations were handicapped probably 50 per cent. by the cold weather Saturday and not more than half crews reported at the mines which attempted to operate. Some were idle throughout the day. Various interruptions were caused by weather conditions, power lines being down, pipe lines frozen up and cars difficult to move under chutes for loading. The output, for the above reasons, was seriously curtailed.

Coke

CONNELLSVILLE

Traffic conditions worse on account of blizzard. Executive committee appointed. Transportation the desideratum.

Car supplies to coke works improved somewhat towards the close of last week, but thus far this week have been very poor, reflecting the influence of the blizzard Saturday. Production is expected to be light all week.

Blast furnaces have had slightly heavier receipts of coke in the past few days, evidently a result of the drastic action taken by practically all the railroads involved in the coke trade, in placing embargoes on the receipt of nearly all freight, coke being one of the exceptions. The object is to clear up the congestion on the theory that if a good start can be made a more regular movement is assured.

The committee of seven appointed at the meeting at Uniontown Jan. 3 between Warren S. Blauvelt, national coke administrator, and the Connellsville coke producers, has appointed three members as an executive committee, to act directly with the Fuel Administration, this committee being: Charles Lenhart, vice president of the Producers' Coke Co.; John Jamison, of the Jamison Coal and Coke Co., and R. M. Fry of the Orient Coke Co. This committee is now trying to formulate a plan of action.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 5 at 216,098 tons, a decrease of 35,300 tons, and shipments at 215,665 tons, a decrease of 39,414 tons.

Buffalo—The local coke consumers have found it hard to get a full supply, but they had good contracts and have depended on them. How long the supply will keep up is unknown, but shippers say that the end of February ought to see the situation easier. The severe winter has tied up railroads everywhere and so far Government management and the taking off of passenger trains has not had any visible effect, especially as any improvement would be counteracted by the weather and the congestion of all trains.

Middle Western

GENERAL REVIEW

Mines and railroad traffic, passenger as well as freight tied up, because of severe storm.

The most severe storm that has been known for years, struck the Middle West-

ern section Friday morning, and raged in all furiousness for 48 hours. Railroad traffic is at this writing at a standstill, and coal mines idle. Hundreds of trains are tied up, unable to move because of the need of motive power. Passenger-train schedules were abandoned, with little prospect of regular resumption for several hours. No attempt was made by coal operators to run their mines Saturday, and they were content to keep their steam pipes in a condition so as not to freeze.

The storm coming from a southwestern direction—which is unusual—caused the thermometer to drop from 25 above to 10 and 15 below in less than 24 hours. The extent and severity of the suffering will not be known for some time. With snow and zero weather all over the Mid-Western section accompanied by a wind that has the velocity of a gale, with telephone and telegraph service paralyzed, it is difficult, in fact impossible, to get the details, such as are needed to make a correct and intelligent report of the exact situation throughout the territory. However enough data have been gathered to warrant the conclusion that the present storm has not had its equal for years. The railroads had just about resumed normal traffic conditions—after several days' battling with the heaviest snow for 15 years—and the present snowfall will tie up coal mines, no doubt for several days.

Dealers that are fortunate enough to have coal on hand cannot make deliveries, because no men are reporting for work, and coal in terminal yards will be worthless to the trade until the railroads can recover to the extent of making deliveries. The first four days of the past week found the railroads with a better car supply than for several weeks past and production was increasing nicely. Had the climatic conditions remained favorable, the past week production would have exceeded any previous week for several months, but with Friday and Saturdy production considered, the total for the week will be limited.

CHICAGO

Blockaded railroad yards and heavy snow wipe out storage stocks. Weather conditions prevent deliveries.

Chicago was visited early in the week with a snow that drifted in many places to a depth of 5 ft. This blockaded terminal yards, and prevented deliveries to dealers until late in the week. With little coal available to the dealers the stock that he had accumulated during the previous week was used. The action of the fuel administration, in taking from several steam plants their storage stock for use by the dealers in emergencies, was unquestionably a wise move, and had the effect of preventing wide suffering. There is now in the various yards of the railroads several hundred cars of coal that is availble for the relief of Chicago, and needs only to be moved to dealers.' yards.

Saturday Chicago was in the grip of the severest blizzard that had struck this section for several years. Railroads were paralyzed, and wagon and auto traffic was an impossibility.

Very few cars of Eastern coal have reached this market during the past week, although City Fuel Administrator Durham has been promised a share from this date forward. So far this promise has not been cashed with results, but dealers hope that by the end of the coming week they will be getting more Eastern bituminous as well as hard coal.

Quotations in the Chicago market are as below, per net ton f.o.b. cars at mines:

MILWAUKEE

Coal and coke advanced 10c. to meet back war taxes on freight. Deliveries confined to 1-ton orders. Wisconsin coal must be released to the Northwest.

Milwaukee coal dealers have received directions to advance anthracite coal and coke 10c. to meet the war tax on freight covering all coal shipped since Nov. 1. Anthracite egg is now $9.20; stove, $9.45; nut, $9.55; and buckwheat $7.65. Coke is now $10 for range and $8 for egg and nut. A carrying-in charge of 50c. per ton is added by dealers.

Deliveries are now restricted to 1-ton lots and are then only made after satisfactory answers to a questionnaire as to amount on hand. Retail trade is practically at a standstill owing to inability to deliver because of blockaded streets following extreme blizzards. Only urgent cases are supplied.

Contrary to previous announcements, coal on Wisconsin docks may be shipped into other states. Fuel Administrator Garfield insists upon the enforcement of his order pooling the coal supplies of Wisconsin, Minnesota and the two Dakotas for distribution under the direction of District Distributor W. A. Grovermann of Minneapolis. The coal is to be distributed in 90 days at the rate of one-ninetieth per day. Gov. E. L. Philipp and State Fuel Administrator Fitzgerald made strong efforts to have the edict overruled, but without success.

ST. LOUIS

The coldest weather in 30 years prevailing, St. Louis came through with coal enough to take care of normal requirements. No outside coal coming in, railroads all tied up and mines idle. Steam plants somewhat short, but no actual suffering.

The past week was a disappointment in many ways, due almost entirely to the transportation problem. Some mines on the Illinois Central worked one day out of six. The L. & N. was almost as bad, and the other roads fell below their previous records.

The latter part of the week, on account of the storm, the situation in the Carterville field became critical and on Thursday a few mines worked, but on Friday and Saturday everything was idle. The snow not only kept the railroads from moving equipment but prevented miners from going to the mines, as electric lines were blocked and trains running five to ten hours late.

The greater part of the tonnage from the Standard field is going for railroad coal. There have been some minor troubles in the field during the past week and this has retarded tonnage, but not seriously.

The last two days of the week the entire field was practically tied up on account of the storm and it is doubtful whether the present week will see the improvement that it should.

The situation, however, as far as St. Louis is concerned, will be all right if all the mines get to working during the present week and the railroads take care of the coal offered. St. Louis weathered the storm all last week in fine shape, with a fairly good supply on hand and with a distribution proposition that was satisfactory to everybody.

There is no coal coming in from the East of any kind and nothing from Arkansas. If the river stays frozen, transportation will become congested over the bridges. The city is laying tracks for connecting the different roads on the east side and the west side so as to utilize the St. Louis free municipal bridge and thus eliminate the bridge arbitrary of 20c. a ton. Mayor Kiel and party returned from Washington with the assurance that the Government would put this into effect just as soon as connections were made. The Terminal Association backed by its supporters in E. St. Louis, are objecting to the use of the St. Louis free bridge for the haulage of coal into St. Louis. This in no way affects the City of E. St. Louis, only that it puts both cities on the same rates, whereas E. St. Louis now enjoys a 20c. cheaper rate.

Householders in St. Louis are in fairly good shape, excepting in the poorer sections, and municipal coal yards are doing reasonably good work and have a fairly good supply on hand.

Steam plants are not so well fixed, but will likely be able to manage to get through.

The Laclede Gas Co. found itself short of fuel and advised conservation of its supply. The St. Louis Fuel Committee ordered the Anheauser-Busch Brewing Co. to sell the gas company about 4000 tons of the Pittsburgh coal it has had in storage for 14 years. More will likely be taken if needed.

The prevailing market price per net ton f.o.b. mines is:

	Williamson and Franklin Co.	Mt. Olive and Staunton	Standard
Prepared sizes, lump egg, Nos. 1, 2, 3 and 4 nut washed and unwashed.	$2.65@2.80	$2.65@2.80	$2.65@2.80
Mine-run....	2.40@2.55	2.40@2.55	2.40@2.55
Screenings and No. 5 nut washed and unwashed....	2.15@2.30	2.15@2.30	2.15@2.30

Williamson & Franklin Co. rate is 87½c.; other fields, 72½c.

KANSAS CITY

On Jan. 7 the visible supply of coal on hand with the Kansas City dealers was 15,222 tons, and the orders on hand were 10,728 tons, a better condition than has existed during any cold wave this winter. The supply of bituminous coal, however, is very light and users of the cheaper grades of fuel are having a hard time to keep supplied. Numerous Kansas towns are calling for coal from the operators' committee, which is notified daily by the state fuel administrator and which takes care of the shipping to these towns.

MISSOULA, MONT.

Coal prices under Government control show final reduction of from 25 to 30 cents a ton over prices of 1916.

The final setting of retail prices throughout the state shows that a reduction of from 25 to 30 cents a ton over coal prices of 1916 has been made by the fuel commission. The highest reduction has been made at Missoula, where the following schedule obtains: Owl Creek, $9.20; Bear Creek, $8.68; Diamondville, $9.87; Roundup, $8.47; Carney, $9.09; Kooi, $8.64; Acme, $9.19. These prices are for lump, mine run prices for Montana coal are 90 cents a ton less while slack prices are $2.10 less. Dealers are allowed a margin of $1.90 over the mine price of Wyoming coal plus freight and tax. As delivery charges are figured at about 90 cents a ton, the gross profit to the dealer is about $1.00.

LEWISTON, IDAHO

Idaho consumers fear shortage if embargo is declared against Wyoming and Utah coals. Washington mines do not nearly supply demand. Retail prices are set.

The threatened embargo of coal shipments to this state from Utah and Wyoming is causing no little concern in the Northwest consumers, dealers and operators uniting in the opinion that a shortage will result as Washington and Montana mines cannot nearly supply the needs. If Washington could supply the needs of the state consumers would welcome the embargo, as the prices set by the fuel administrator for Washington coal is considerably lower than the prices for Utah and Wyoming coal.

A new scale of retail prices has become effective in this city, which is a fair example of the prevailing retail prices throughout the state. These are as follows: Rock Springs, lump, $9.97; mine run, $8.97; slack, $7.21; Utah lump and egg, $9.73; mine run, $9.48; slack, $8.72; Owl Creek lump and egg, $10.07; Bear Creek lump and egg, $9.81; slack, $7.71; Chestnut lump and egg, $9.71; Acme, Carney, Monarch lump and egg, $8.72; mine run, $8.72; Black Diamond, Renton, lump and egg, $10.46; pea, $8.95. Roslyn and Cle Elum grade, lump and egg, $8.03; mine run, $7.77; Newcastle nut, $10.19; Roundup lump and egg, $9.71; Big Horn lump and nut, $9.82.

SAN FRANCISCO, CAL.

Reduction of 50 cents a ton on Utah coal has been ordered by Albert E. Schwabacher, fuel administrator for California in San Francisco. Maximum prices have been fixed as follows: Bituminous-Utah, $14; Wyoming, $14.50; Wellington, $15; Colorado, $16.20. Anthracite-Colorado, $19; New Mexico, $22; Pennsylvania, $24. Screening, all grades, $10.

COAL AGE

Volume 13 NEW YORK, JANUARY 26, 1918 No. 4

An Interview with the Fuel Administrator

By Floyd W. Parsons

"I have a boy in France and another here in the army. Thousands of other parents are in the same situation. If we, as a people, are not big enough to do this most necessary thing, then indeed we are a sorry lot," said Dr. Garfield, in referring to his now famous closing-down order.

I SPENT more than an hour with the Fuel Administrator Monday, discussing the necessity of closing down the Nation's industries in order to relieve the present critical fuel situation. I went to Washington in the full belief that other remedies might have been applied. I had plenty of what I thought was constructive criticism. I must confess that I left Doctor Garfield believing that he took the only wise course possible. Here are a few high spots of his conversation.

"I do not believe in the idea of shutting down non-essential industries. You cannot shut down many so-called unessential businesses without drawing the life-blood of some most essential industry. The exemptions that followed my original order were not an afterthought; they were planned days ahead, and each and every company exempted was listed at the suggestion of the Secretary of War and the Secretary of the Navy.

"The idea that the order issued was designed solely for fuel conservation is incorrect. Directly and indirectly we will conserve coal, but the main purpose of the ruling is to break up the congestion of freight and permit transportation to again assume a normal condition. Approximately 50 per cent. of the cars blocking the railways are loaded with coal. It is absolutely necessary to get this traffic out of the way before even such vital things as food can be moved to the markets.

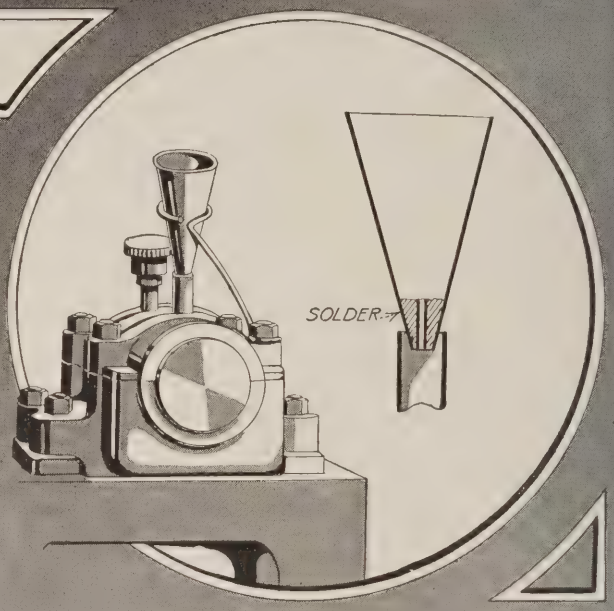
"Why did we shut down mills and factories operated by water power? Because we do not want more manufactured products to pile up and create an even worse congestion of freight immediately after this five-day suspension ends. Our munition plants in many cases have already produced more war material than our transportation facilities can handle.

"I had no thought of the psychological effect of the order, although I agree it carries such possibilities. Nor did I consider the dollar-and-cents effect of the industrial shutdown on the Nation. It simply had to be—there was no other way. The necessity for such an order has accumulated since Nov. 26, when I failed to get through a priority ruling for the shipment of coal. I told the President: 'Your automobile has the right of way in Washington streets, but if a couple of 'Fords' block the way, you can't get past. Coal is blocking the way. It must be moved.'

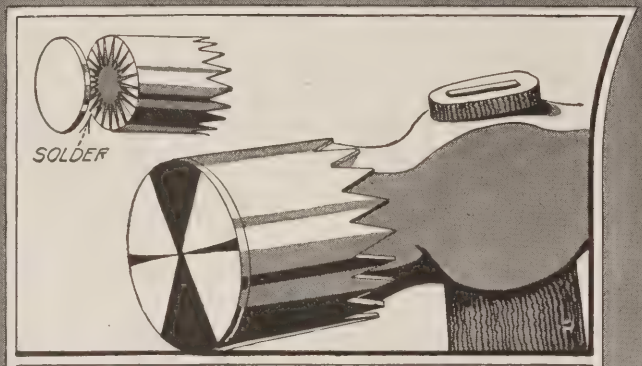
"You ask why couldn't industry continue at its normal pace and double energy be put into our transportation effort? The reason is that there is an insufficient number of locomotives to greatly increase the tonnage now moving. If all the loaded cars at every terminal could be unloaded today, it would take time for our available motive power to get these cars back to the mines and the mills.

"In 1913 American railroads ordered 3467 locomotives; in 1916 they ordered 2910, and in 1917, 2704. At least 5000 new locomotives are needed each year by the railroads of the United States. In 1916 foreign orders for locomotives totaled 2983; in 1917 our Allies ordered 4938 railroad engines, of which 2057 were for the United States operations in France. Deliveries of locomotives have been in about the same proportion. United States railroads received 5332 locomotives in 1913; 1251 in 1915; 2708 in 1916; and 2585 in 1917. Deliveries to foreign countries in 1917 were 2861. Locomotives built for Russia and France cannot be used generally in the United States, due to the different gage and height of the Russian locomotives, and to the increased height of the French locomotives. These facts give a fairly clear idea of where the trouble lies.

"It wasn't possible to give the country previous notice of the closing-down order, for the reason that the railroads would have been flooded with freight, and the remedial effect of the order thereby nullified. If the industries had been allowed to go on manufacturing and piling up supplies, the railroads would have been swamped with freight immediately on the resumption of normal railroad operations."



The foregoing statements explain the principal reasons responsible for Doctor Garfield's order. But I gathered many other thoughts that were evidently running through his mind. Among them are municipal storage yards, Government control of important coal-loading piers, the more effective use of our water-ways; which is in line with the action just taken by Railroad Director McAdoo on an appropriation for river transportation. I expect Doctor Garfield to put into effect very soon the long-talked-of zone system for coal shipments and other plans that will largely eliminate cross-hauling.



We may expect that the present closing-down order is but the first of perhaps several such rulings. It would surprise me if the next order of this kind did not include the entire discontinuance of all passenger trains for a specified period of time. The Germans shut down all general passenger traffic for days when immense troop movements are under way.

Coal Mining in Utah During 1917

By A. C. WATTS
Chief Engineer, Utah Fuel Co., Salt Lake City, Utah

THE year 1917 has been in some respects, due to causes which must be ascribed almost as much to natural as to human agencies, the most eventful year in the history of coal mining in Utah.

This industry in Utah had been showing the effect of the European War before the advent of 1917. It was mainly affected by the ever-increasing difficulty in obtaining a sufficient supply of railroad cars to keep the mines working, but the demand for Utah coal was increasing all the time. The California production of oil was not increasing, and the demand for oil for war uses, together with the raise in its price, had made it necessary to curtail its use for domestic as well as manufacturing, mining, metallurgical and railroad purposes. In addition to this, the coal imports from Japan and China as ballast, and from Australia, British Columbia and the Atlantic seaboard had entirely stopped. The coal output of Washington was entirely inadequate to meet the demands of the Pacific Coast and the country to the east. The Union Pacific Coal Co. in Wyoming withdrew from domestic trade entirely, and the shipments from southern Colorado and New Mexico could not be increased to an extent that would be noticeable.

EIGHT-ROOM MINER'S HOUSE AT CASTLE GATE

Naturally the vast area to the west of us looked to Utah for help. Starting in November of 1916, and lasting until well along in March of 1917, Utah and Wyoming experienced one of the most severe winters in their histories. Not only was the cold unusual, but the low temperatures were sustained without noticeable interruption for comparatively long periods of time. What, however, proved to be the most trying conditions to combat were the most unusual snow falls and the high and sustained wind storms. Utah received most of the snow and Wyoming most of the wind. In Salt Lake City the seasonal snow fall amounted to about 100 in., whereas in Wyoming the terrific winds so drifted the snow and sand as to practically tie up the Union Pacific system for three or more weeks, and it was only by unceasing efforts that the Denver & Rio Grande kept its lines open. In the spring the flood waters in some streams to the north and west were so high that some branch railroads were tied up for considerable periods. At one time there were 600 or more cars of coke tied up en route to smelters to the north, while hundreds of cars of coal were delayed for the same reasons.

With the return of warm weather, the transportation facilities of the Denver & Rio Grande, the main outlet for Utah coal fields, were becoming gradually better, when the road suffered one of the worst calamities in the history of Western railroads. This was caused by the breaking of a storage reservoir in the mountains some 20 miles off the main line. About 13,000 acre-feet of water were released down the narrow canyon of Price River, washing out miles of double track main line, and almost completely destroying six miles of the branch line, running from Colton to the Utah Fuel Co.'s mines in the Pleasant Valley District. Had it not been that Pleasant Valley acted as a storage reservoir which first caught the flood waters and then gradually (comparatively speaking) discharged them,

practically all the main line from Colton to Helper would have been washed out, together with the mining towns of Cameron, Castle Gate and Carbon, and the railroad division point Helper. As it was, it took tremendous efforts to save property at Castle Gate, where the destruction in towns was greatest.

Rebuilding commenced at once, the railroad summoning all its resources and being generously aided by other companies, the coal mines supplying hundreds of men, and what suitable equipment they had. Traffic on the main line was resumed in ten days, but the period of commercial idleness for the mines on the main line lasted from June 25 to July 11, and normal traffic was not possible for about six weeks. The Pleasant Valley branch through the canyon was almost entirely rebuilt by coal miners under supervision of their foremen, superintendents and railroad officials, and was out of commission until Aug. 29—over two months. It might be said in passing, that some very efficient track gangs were developed from among the miners by this experience.

During the course of the summer, the transportation trouble was aggravated by a strike of blacksmiths on the Denver & Rio Grande, and by the extreme difficulty in obtaining sufficient section men and other classes of workers.

The people of Utah and neighboring states to the west and north, with the remembrance of the cold weather of the past winter and the difficulty in obtaining enough coal to keep warm still fresh in their minds, and with the warnings of coal dealers to "stock up," and their "I-told-you-so" ever ringing in their ears, commenced early in the summer to store, but were interrupted by the flood. Naturally, after the flood, the demand increased and has but just been satisfied. Coal dealers have forgotten what it looks like to have coal piled up in their yards. The agitation by calamity howlers and irresponsible newspapers stirred up much unjustifiable apprehension. A census about two months ago of the supply of coal in private bins of Salt Lake City showed an unusual amount in storage, although there was none in dealers' yards.

To aid the coal situation the fall and winter thus far in the region west of the Main Range has been for the most part unusually mild. With very little snow and with uninterrupted deliveries and mild weather, the panicky condition of the consuming public has entirely disappeared; in fact the fuel administrator for the state is now urging people to buy coal and thus prepare for the bad weather that is sure to come.

New Engineering Developments

One of the most important changes in an engineering operating sense has been the use of hydro-electric power in place of power generated by independent steam plants at the mines.

The Utah Power and Light Co. built a line into Carbon County and is now serving nine companies, operating 13 mines. The power company has 30 hydro-electric plants feeding into its transmission system, which runs from Grace, Idaho, to Santaquin, Utah, with its largest plants in southern Idaho. The line running into Carbon County has a capacity of from 4000 to 5000 kw., and is at present operated at 44,000 volts, although it is constructed so as to be capable of furnishing power at 130,000 volts should the load increase so as to demand it.

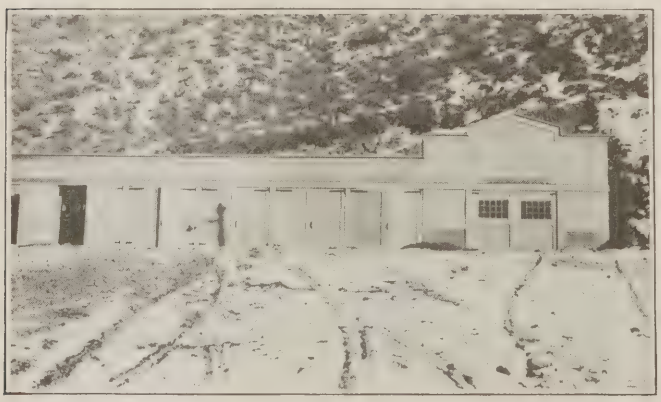
The contract demands of the mines served calls for 4210 hp. The installed horsepower at these mines is, of course, greatly in excess of contracted power. The estimated total yearly consumption of power at these properties is 8,928,000 kw.-hr. Assuming the consumption of coal in small steam plants to be 12 lb. per kilowatt-hour, the purchased hydro-electric power re-

FLOOD SCENE AT THE TIPPLE OF THE UTAH FUEL CO., CASTLE GATE

HOW THE LOWER YARDS LOOKED AT CASTLE GATE DURING THE FLOOD

leases approximately 53,500 tons of coal per year for market purposes. The coal formerly used under boilers was mostly dust and slack, and the value of the above-estimated saving at prices fixed by the Government Nov. 1, 1917—namely, $2.80 per ton—is $149,500.

Four of the mines being served are just entering the producer class, but by the end of 1918 they should be contributing materially to the total output of the state. The mines using hydro-electric power have produced during the past year approximately 50 per cent. of the total output of the state, or about 2,000,000 tons.



The power company is now furnishing approximately 100,000 hp. for various power purposes, which the company estimates is between two-thirds and three-fourths of all the power used in Utah.

Of equal, if not greater, interest has been the independent operation of the Utah Coal Ry., known as the Utah Coal Route, which began Dec. 1, 1917. This road joins the main line of the Denver & Rio Grande Ry., at Utah Junction, about a mile and a half below Castle Gate, and has terminal yards at Provo, between the Denver & Rio Grande, and the Los Angeles and Salt Lake Road.

It commenced operations with six heavy engines of the Santa Fé type, and four old engines of the old Castle Valley Ry., and 2000 coal cars of 50 tons capacity each. The company expects three Mallet-type engines to arrive shortly.

The mines situated directly on this road are Mohrland, Black Hawk, Hiawatha, Wattis, Panther, Castle Gate and Cameron. The total tonnage hauled by the road during its first month of operation is about 110,000 tons. The operation of this road permitted an increase of about 50 per cent. in shipment from the mines it serves, and naturally helped the mines off its line because of supplying its own cars to the mines on it.

Among other engineering features has been the change of the Spring Canyon Coal Co. from the aërial tramway to the inclined engine plane hoisting method of bringing coal from its mine to the tipple.

GARAGE AND REPAIR SHOP FOR EMPLOYEES; UTAH FUEL CO., SUNNYSIDE

New Mines Have Been Opened

Three new coal mining companies have started operations. The Peerless Coal Co., opening a mine in Spring Canyon, near Storrs; the Liberty Fuel Co., in Spring Canyon, above Standardville, and the Wattis Coal Co., with operations on the new Utah Coal Road near Hiawatha. In addition to these, the Independent Coal and Coke Co. is opening a new mine adjacent to its main operations. The output from these mines is at present small, but by fall of 1918 should be about 3000 tons per day.

In Summit County the Weber Coal Co. has reopened the Wasatch mine and is hauling about 140 tons per day by wagon to the railroad. It is rebuilding 2½ miles of railroad to its mine and will be able to ship about

300 tons per day when it is completed. Hydro-electric power is used for pumping and steam power for other purposes. The Summit Fuel Co. is now shipping about a car a day. The Grass Creek Fuel Co., using hydro-electric power, is shipping about 150 tons a day, which will be increased to about 250 tons in 1918.

The market for Summit County coal is almost entirely local, although some of it is being shipped to a smelter in Nevada. In the southern part of the state the old Wales mine has been reopened, and in addition to supplying some local demands is shipping some coal into Idaho.

In Carbon County the Millburn property has been leased and is operated as a wagon mine. The mine is about nine miles from Price and Helper, and will supply a proportion of the people in these towns, as well as Wellington and adjacent ranches. Wagons are driven into the mine and the coal loaded from the face.

Effect of New Mines

The questions naturally arise, what will be the effect of opening these new mines, and will the state's production be increased thereby? In answering these questions, the first condition that confronts one is the fact that the older mines averaged not more than 65 per cent. full working time during the year, and that the main cause for this was lack of sufficient railroad cars, there being no dearth of orders; rather, the mines were months behind their orders. With the increase of business which is sure to come, or even with the maintenance of present demand, the necessity of transporting soldiers and war supplies, and the slowness or impossibility of getting more equipment, it does not appear probable that there will be a marked improvement in the transportation problem. If such proves to be the case, the opening of new mines would seem to promise ill effects.

The service demanded by new mines will call for more power and more cars, more track to build and keep up. Furthermore, the multiplication of mines increases the chances of accidents, which will tie up railroad equipment and thus reduce the car mileage. In addition these new mines will draw to a large extent upon the older mines for their miners and minor officials, because a certain number of men will always seek new fields. This means the older mines will in cases have to reorganize their forces and go to new fields for more men.

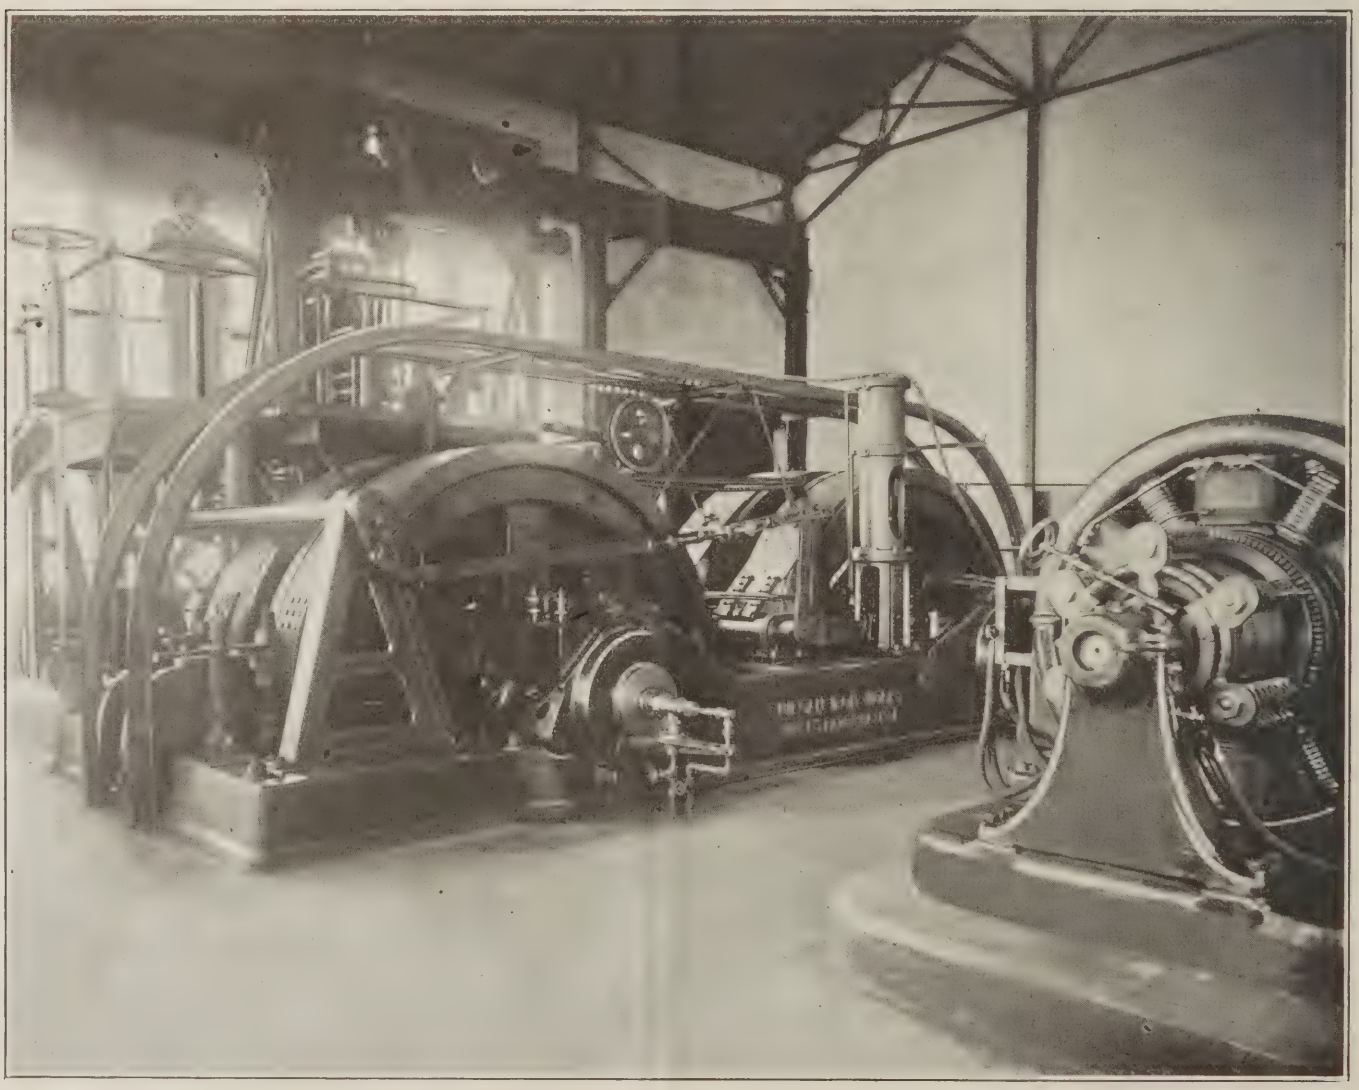
If the labor supply becomes any worse, the opening of these new mines may mean to a certain extent the crippling of established organizations and productions for the benefit of new untried ones.

On the other hand, offsetting the foregoing conditions, we now have Government operation of railroads, which will undoubtedly benefit the distribution of cars and the transportation service to the mines. Again, the high wages now existing at the coal mines will attract many men to them from other fields of endeavor, and although this is the time of year when the labor supply at the coal mines is greatest, it seems certain with steady work that it will not diminish materially in the spring. Though there are many uncertainties, it is probable the new mines will add to rather than diminish the output.

There has naturally been considerable increase in activity among the wagon mines of the state. As a general rule, the operation of these wagon mines has no ill effect on the railroad transportation problem. Wagon mines are usually located off the railroads and their coal is not loaded into railroad cars for shipment. Instead the farmers and other people living near these mines drive to them and take the coal away in their own conveyances. The men working these mines are not as a rule taken from the larger coal

MINERS' WASH- AND CHANGE-HOUSE AT SUNNYSIDE

mines, but are usually farmers and their sons who work in the mines in the fall and winter, while not engaged in farming. Just at this time, it must be said that the wagon mines of the type described are a benefit to the transportation problem and coal situation, because to ship in coal to these out-of-the-way places on branch lines where railroad facilities are not the best, means the tying up of equipment that could be put to better and quicker service on or near main lines. However, it does not serve an economic purpose to load coal from wagon mines into railroad cars and ship it outside the state or local communities, but this is being done.



Will Mines Be Able to Increase Production Yearly?

Increase in production during 1918, depends solely on the labor supply and transportation facilities. With an adequate supply of cars the production from now on until about March should increase from 15 to 25 per cent., as many men attracted by the high wages and the desire to have inside work during the winter months are going to the coal mines. Many of these men are old miners who have in times past accumulated enough money to buy farms, both improved and unimproved. Now that the crops are in, they go to the mines to earn enough money with which to improve their farms, or to pay off indebtedness on them. Such men are very desirable, for they are experienced; and the fact that they have heretofore saved enough to invest in farms shows that they have been thrifty and efficient.

The labor supply has shown an increase of about 10 per cent. commencing about the middle of December, and at present writing it exceeds the demands. The older mines have, as a rule, sufficient development to take care of enough men to give an increase of about 25 per cent. in production. In the new mines development work can be increased and thus make new properties capable of materially increasing the production next year. If then, the railroads can supply sufficient cars, there should be an increase of production next year. Industries, especially mining, will demand more coal; the public will commence to store early in the year so that indications do not show any abatement of demand.

The mines of Utah are handicapped to quite an extent in obtaining miners. In the first place many miners prefer to work in metal mines, some because they do not like coal mining, and some perhaps because of the fixed wages which are now high in metal mines, though not so high as in coal mines. Some men prefer to work for a fixed wage. Others, knowing that with present prices they can make much higher wages in coal mines, go to the latter.

Many of Utah's mines are off the main lines of the railroad and without much advertising do not attract

VULCAN HOIST INSTALLED AT THE BLACK HAWK MINE

WOODWORKING MACHINERY AT THE SHOPS OF THE UNITED STATES FUEL COMPANY

the attention of the men. Then, too, Utah is not in or near the centers of densest population and does not have the supply to draw from as do the mines in states farther east. Furthermore, many men prefer to work in places near large towns to which they can easily go for change and amusements. As both labor and transportation are unknown quantities, it is impossible to accurately predict the future; but with a fair chance, the output next year should be around 5,000,000 tons.

New Mining Methods

The method of laying out a mine most in vogue in Utah is the "three system" of room and pillar. The latest efforts are now directed toward adopting panel systems and instead of spreading the workings out over a large territory to get the required tonnage, to practice intensive methods of quick and large production from small sections. This, of course, necessitates the complete extraction of all the coal in a given area. Among the advantages arising from this method are the reduction in amount of tracks, power and pipe lines, a saving in timber and a great saving in haulage and inspection.

Coal-loading machines have been introduced. The Independent Coal and Coke Co. started with a Myers-Whaley machine, and the United States Fuel Co. has two machines coming—a Myers-Whaley and a Halby. The success of these machines depends largely on local conditions, but with the thick flat seams and the hard, tough coal of the mines they will be operated in, there does not appear to be a very large element of chance in their success. With a loading capacity of 150 tons per eight hours, they will do as much work as ten average loaders and will reduce the man requirements to three or four men. They will also tend to centralize production and thus reduce haulage expenses.

There has been a large increase in the use of mining machines due in considerable degree to the difficulty in obtaining a sufficient number of skilled miners. This makes the tonnage per man-day higher.

Outside the mines, the use of gasoline motor trucks at some of the plants has done away with many horses and greatly increased the efficiency of handling material. These trucks have, in one instance at least, saved shutdowns at the mines.

At Sunnyside, the Utah Fuel Co. has installed three magnetic separators in the crushing plants where coal is prepared for the ovens. A miscellaneous assortment of sardine cans, pocket knives, pick points, pieces of rails, splice bars, bolts, nuts, spikes, etc., is collected by these magnets. Practically the entire time of one man is devoted to straightening, cutting and rethreading

TOWN AT BLACK HAWK MINE, UNITED STATES FUEL COMPANY

bolts and sorting nuts and spikes, and the saving of this alone nearly pays for his wages. In addition the saving of wear on the disintegrators and the resultant improvement in the coal sent to the ovens and the better grade coke made therefrom is difficult to estimate, but is very appreciable. Of not the least importance, however, is the reduction of fire risk, due to taking the iron out of the disintegrators, for in the past at least four fires have been directly attributable to this cause. The Utah Fuel Co. has built 93 thirteen-foot beehive coke ovens during the year, and these, in addition to the 726 twelve-foot ovens already in use, makes a total of 819 ovens now operated by this company.

Safety standards in Utah have not been neglected during these strenuous times, although such events as first-aid and mine-rescue contests have been for the time being discontinued. The flood in June put the mines back in the filling of their orders, and since then it has been a question of working whenever possible without certitude of knowing when an idle day could be had during which to hold a meet.

At this time, when there is such urgent need for all coal that can be produced, operators more than ever realize that it would be the height of folly to countenance any practices that might end in disaster. The state coal mine inspectors, together with all company inspectors, thoroughly believe in the safety measures in vogue in this state, and are conscientious in demanding their observance. In the shops modern safety appliances are becoming more numerous each year.

In gaseous mines miners' electric lamps are replacing the gasoline safety lamps, and the result has been an increase in efficiency as well as safety. The Bureau of Mines instruction car visited the mines during the year and gave the customary instructions.

Although not directly a safety measure, and not directly instituted by coal men, the state prohibition law received the hearty support of coal-mine operators. Undoubtedly prohibition promotes the efficiency of mine workers and adds greatly to their safety and general welfare. Our saloons are now being converted into boarding houses, stores and amusement halls. Contrary to the dire prophesies of the liquor interests, there has been no exodus of men to wetter fields, and those who have gone can well be spared; for a man who depends upon alcoholic beverages to give him his strength and zeal, does not amount to much.

The prices set by the Government raised the average of Utah's selling prices except to some of the markets. By raising the price of slack the large consumers have been made to shoulder their share of an increased cost, made necessary by war conditions. Ultimately the general public shoulders the burden, but it is more generally distributed. For instance, a raise of 1c. a pound for copper, caused by a raise in the price of coal to the copper mines and smelters, will not be felt nearly so much by the ordinary householder as a raise of $1 a ton in the coal he must use to keep him warm and cook his food.

Government regulation has entirely eliminated competition and has put all producers and consumers on an equal basis. There is now no chance for a large consumer to get a better price than his smaller competitor and thereby obtain an advantage over him in the conduct of his business.

Government Regulation Stabilized Industry

Salesmen now are not busy trying to get orders, rather they are worried to distraction trying to keep customers supplied. Price cutting and questionable competitive practices have been stopped. It has undoubtedly stabilized the industry. The raise in the price of slack has caused some consumers to change to nut coal. In view of the high grade and large sizes of slack made in Utah it is not apparent why consumers should wish to change, as there is still a differential of 50c. a ton between slack and nut.

For most points in Utah, the freight charges on slack are 25c. a ton less than on the larger prepared sizes, and there are places in Idaho where there is a 50c. difference.

It costs as much to mine and prepare slack—in fact, a good slack is harder to prepare—and during slow times there was more trouble about slack than over larger sizes. There would be too much fines in it, or too much dust sticking to it, or it looked dirty, and this when it was selling for from 50c. to $1 per ton at the mine.

People became accustomed to regarding slack as a waste product of the mines. This idea is of course erroneous at all times, particularly now, and in regard to Utah coal it is erroneous in a peculiar sense. Utah seams now being mined are thick seams. In many mines the roof is never seen until pillars are drawn, and the coal does not stick to the roof or floor. Moreover, the deposits are practically universally free from impurities. In most mines the mining is done by machines

which cut in the coal so that all slack made by them is pure coal. With a hard bottom, often formed by coal, no impurities are loaded out with the slack. We thus have slack and dust which run practically the same in heat values as the larger sizes. City consumers have in the past raised the objection that slack makes more smoke, and many well-meaning people tried to have ordinances passed prohibiting the use of slack in city plants. A trip around Salt Lake City with one of the smoke inspectors would soon convince them of their error.

The fixing of prices and consequent raising of wages for mine employees have caused a few to become more difficult to handle and less efficient. Miners can now make as much in three days as formerly in four or five, and as the expenses of many have not increased proportionately they do not care to work so long. Constant work also impairs efficiency, as the output per man-day readily shows.

High Wages Attract Labor to Mines

The high wages have undoubtedly attracted many men to the coal mines; to their benefit, but possibly to the detriment of other classes of mining. Unfortunately, the wage increases to the monthly and salaried men have not been proportionate to those granted miners and day men, and this condition ought surely to be remedied. This class of men embraces all those who are looked to for loyalty at all times, and as their expenses have been increased more than day men, they cannot understand why they should not receive proportionate increases in wages.

Employees now demand more in the way of accommodations. The number of steam-heated quarters has had to be increased and the general condition of these quarters improved. After spending thousands of dollars for steam heat, plastered houses, reading rooms, bathhouses, fences, good beds and new bedding, it is certainly discouraging to note how some people abuse them.

The drafting of men for service has caused considerable readjustment at the mines. Quite a large percentage of the mechanics, electricians, machine men, drivers, hoistmen, clerks and mining engineers, etc., are Americans and subject to draft. When these men were called to the colors, or volunteered, it often proved difficult to replace them. The miners being comprised for the most part of nationalities not subject to draft have not been affected to any material extent.

State legislative action of great importance to the coal-mining industry took form in the passage of a Workmen's Compensation Law, which was made to become effective July 1, 1917. The passage of this act met with almost universal approval, the only exceptions, possibly, being that class of lawyers who make it a practice of stirring up damage suits between employer and employees.

The act provides that employers who comply with its provisions shall not be liable to respond in damages for injuries sustained by their employees not resulting in death. If injuries result in death, the dependents of the deceased may elect between suing or the acceptance of the benefits allowed by the act. If they elect to sue, they must prove negligence on the employer's part and then forfeit the rights to compensation under the act, and the employer may plead the common law defenses—negligence on part of employee, negligence of fellow servant and assumption of risk.

Employers may provide for insurance in three ways—with the state, with insurance companies, or they may carry their own insurance if financially responsible in the judgment of the state. The insurance rate for coal mining was placed so high that many of the larger operators carry their own insurance.

During the year there has been a great deal of building in the older camps in addition to the large amount made necessary by the opening of new mines.

Changing conditions have demanded more houses. The call of the younger men to arms has made it necessary to employ many more older men who are married, and that has meant more houses. The large increases in wages have permitted many families to expand and demand larger quarters, and many have given up boarders, not now wishing to endure the extra work and inconvenience entailed in keeping them.

To keep men and their families contented and to increase efficiency and productiveness it has become necessary to further rather than abate the efforts to improve living conditions in the towns. Thus we can now observe some of the older towns laid out in regular streets, lined with trees, and with lawns and gardens fenced in. The Utah Fuel Co. alone has built two large amusement halls, costing $25,000 to $30,000 each. In addition it has built three large miners' wash- and change-houses, each capable of caring for 300 men. The United States Fuel Co. is working along the same lines.

The schooling facilities in Utah have ranked among the best in the country and have not been allowed to suffer in the coal camps. Utah takes pride in being

UNITED STATES FUEL CO.'S STEEL TIPPLE AT BLACK HAWK

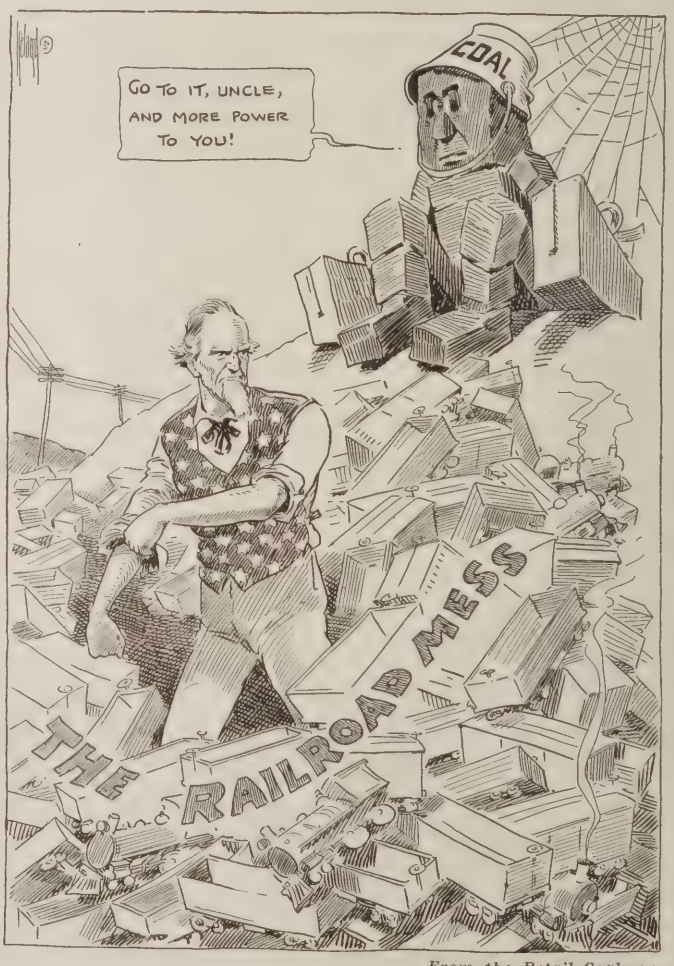
among the leaders in caring for the teachers. At the camps they are provided with comfortable quarters and may keep house if they choose.

The method of proportioning the car allotment for coal mines is known as the "Idle Hour Basis," and was devised by the late F. R. Rockwell, former general manager Western Division of the Denver & Rio Grande. By it sufficient cars are to be supplied to each mine to keep the tipples running eight hours per day. Each mine orders sufficient cars from day to day to take care of its output, and is credited with full time and the hours worked marked against it. If the railroad has not supplied sufficient cars one day to keep the tipple in operation the full eight hours, it must make up the difference at some future time, for the mine is credited with the hours it could not work through the inability of the railroad to furnish a sufficient number of cars.

On the other hand, if the mine does not load the cars supplied it, or has delays, they are counted the same as if they had loaded the full allotment or worked the entire eight hours. By this scheme, if operators are honest in reporting delays, there is no discrimination between mines or companies and there is great incentive for operators to load as much coal in their working hours as possible. They must try to keep all their men steadily at work and to maintain their equipment at the top notch of efficiency.

Many Foolish Suggestions Are Made

Of course, there are many suggestions made by people who always know better than anyone else what to do. For instance, there appeared in one paper the recommendation that all the coal be pulverized at a central point, such as Helper, Utah, some 115 miles from Salt Lake City on the Denver & Rio Grande, and then pumped through pipes with the aid of water to Salt Lake, where it could be distributed. This would save the railroad much work.



A scheme like this is about on a par with the suggestion made for smoke abatement in Salt Lake City during the winter months. The scheme was to drive a great tunnel through the mountains north of the city to the other side of the Divide and then install large ventilating fans to suck the air from the city and drive it through the tunnels. Americans are noted for their inventive genius, and with such helpful suggestions as the above we may confidently hope that soon all the consumer will have to do is to push a button or turn on a faucet and he will get all the coal he needs.

As yet no direct effort has been made to encourage men to work six days a week regularly. The need of some such incentive may become imperative when it is possible to work six days a week continuously. When car supply permits working but three or four days a week many men go into the mines on idle days and prepare their places, or load all available empty cars. The operators help in this by cutting all places that are ready to be cut, distributing empty cars and gathering loads to the partings ready for immediate transportation to tipples on working days. By these means the men maintain their average earnings and the production per working day is largely increased. Also there is no delay the first thing in the morning due to "No Coal."

Normally, between 10 and 15 per cent. of the miners are continually "laying off." Abnormally high wages and steady work will increase this percentage rather than diminish it. One of the avowed objects sought to be attained by the recent Government increase in wages was to increase production by rendering the returns more attractive to the men. It has meant to a large degree merely an increase of pay for the same amount of work.

It is rather generally accepted as a true principle of scientific management that a bonus system is the best appeal for calling forth increased efforts. There does not now seem to be the opportunity to apply this means, and it is a serious question what is the proper system to adopt should the labor supply become inadequate, as may be the case if the war continues for a long period.

As one able operator puts the matter, "We have tried moral suasion, mental suggestion and verbal coercion, backed up by appeals to their cupidity, patriotism and the debt which they owe to their families," and all prove futile to convert the industrial slacker into an efficient producer. Some have tried the fining system. By this, men are fined a dollar a day when they lay off without good reason, and they are required to present their reason in advance, but what does a dollar mean to a man earning from $8 to $15 per day. The problem is not yet solved and it may eventually mean industrial conscription.

From the Retail Coalman.

IS GOVERNMENT CONTROL OF RAILROADS THE SOLUTION?

St. Louis Coal Trade in 1917

By E. J. WALLACE
St. Louis, Mo.

SYNOPSIS—*The year 1917 has been active, puzzling and exciting. It witnessed prices highly remunerative and almost destructively low. Toward the latter part of the year transportation became an uncertain factor and the one upon which the market hinged more than on any other.*

WHEN 1917 came into being the coal trade in the St. Louis territory looked back with a longing that was pathetic to the wonderful record of 1916. The year opened with the highest prices on record, and a demand that exceeded all expectations. The mid-winter slump of former years failed to materialize. Unusual demands from districts that never before called on St. Louis shippers, a car shortage that was appalling, poor transportation facilities and embargoes of all kinds, in addition to petty strikes at the mines, were a few of the problems that confronted the trade. The market was:

	Carterville District	Mt. Olive District	Standard
6-in. lump	$3.50	$3.50	$3.50
3x6-in. egg	3.50	3.50	3.50
2x3-in. nut	3.50	3.50	3.50
No. 2 nut	3.50	3.50	3.25
No. 3 nut	3.50	3.50	3.25
No. 4 nut	3.50	3.25	....
No. 5 duff	3.25	3.00	....
2-in. screenings	3.25	3.25	3.25
2-in. lump	....	3.50	3.50
Mine-run	3.50	3.25	3.25

Carterville rate, 72½c.; others, 57½c. to St. Louis.

The outside markets paid as much as 50c. over these prices, but there seemed to be an attitude that the St. Louis market would not pay more. The embargoes were the cause of this in a general way.

The steam demand was the hardest to handle. Small storage bins kept many plants on a day-to-day supply and many retail yards in the city were without coal for days at a time. Buyers were here from points in Ohio, Indiana, many of the Southern and all the Northern and Western states, and there was no limit to the price if the coal could be secured.

Anthracite coal, which was almost off of the market at the close of 1916, moved in during the first few weeks of 1917 in a surprising tonnage, but this did not continue. Eastern smokeless was hard to secure and but little came forward. Arkansas was much in the same class.

The year opened with retail prices at: Carterville (coal from Williamson and Franklin County) $4.75 to $5; Mt. Olive, $4.50; Standard, $4 to $4.25; anthracite chestnut, $10; egg and stove, $9.75; grate, $9.50; smokeless egg and lump, $8.25; Arkansas, $8.50 to $8.75, all per net ton gutter delivery.

In January there was a tendency to fear an easy market ahead and considerable coal was sold at prices below the circular on tonnages that would carry to Apr. 1. This caused a local slump the latter part of the month, more pronounced in the Standard and Mt. Olive fields than in the Carterville district.

At this time the railroads placed big orders, taking all the surplus coal available in the three fields. The bulk of the open-market coal moved to Chicago, that market keeping buyers here throughout the season.

The failure of the Terminal at St. Louis to handle coal for shipment west of the river forced the Chicago shipments. Coal was held up at St. Louis for as long as two weeks on account of the Terminal congestion. There was a general feeling that if coal was moved as it should be that a market $1 per ton lower would prevail. The slow movement kept the price up.

In February contracts were made for the period of one year and some up to Apr. 1, 1918, at $1.65 to $1.85 for screenings, and $1.65 to $1.75 for mine-run. This is an indication of what the future looked like to the trade. At the same time the output of several Carterville mines were bought outright at figures close to those quoted above for mine-run.

The general market dropped about 50c. in February on all sizes. Steam coal was in better demand than domestic. In March, the market toned up about 25c. a ton at the beginning and slumped off 50c. about the middle of the month. Steam coal again held up better than domestic. The spurt about the first was purely due to failure of the roads to deliver loads and furnish empties. The congestion was so serious that business organizations in St. Louis held meetings with the representatives of the roads demanding that better service be rendered. These meetings resulted in much good and coal began to move more freely.

Railroad orders at this time paid $1.25 to $1.40 for mine-run in the Standard field, cars to be furnished by the buyer. The January and February price was $1.60 to $1.75. Many mines unable to get cars for commercial loading were glad to accept these prices.

Apr. 1 saw the end of the strenuous season. With warm weather the market went to pieces. It was much like old times, with coal selling at about production cost in the Standard field and not far removed therefrom in other fields.

The second quarter opened with the following market:

	Carterville	Mt. Olive	Standard
6-in. lump	$1.65@2.00	$1.85	$1.15@1.25
3x6-in. egg	1.65@2.00	1.85	1.15@1.25
2x3-in. nut	1.65@2.00	1.85	1.00@1.10
No. 2 nut	1.65@2.00	1.85	1.15@1.25
No. 3 nut	1.65@2.00	1.85	....
No. 4 nut	1.65@2.00	1.85	....
No. 5 duff	1.65@2.00	1.75	....
2-in. screenings	1.65@2.00	1.75	1.00@1.10
2-in. lump	1.65@2.00	1.75	1.00@1.1
Mine-run	1.65@2.00	1.50	1.00

Embargoes against Chicago and the North were largely responsible for low prices here. The car supply became good and movement of coal normal. A tendency prevailed among operators to contract. Several closed in the Carterville field at from $1.85 for No. 5 to $2.35 for No. 3 and $2.40 for No. 2. A few minor steam lump contracts went at less than $2.50. The same price prevailed on egg and No. 1 nut. Screenings went at $2.25 to $2.40.

In the Mt. Olive field somewhat similar prices prevailed. Steam lump contracts were made at $2.25. Standard screenings contracted for $1.75 and a few steam lump contracts were made at $1.50.

The Carterville circular quoted lump, egg and nut at $3; mine-run and screening at $2.75 for April.

No dealer contracts were made from any fields. The retail price at this time was: Carterville, $4.25; Mt. Olive, $3.75; Standard, $3.75; anthracite chestnut, $10; egg and stove, $9.75; grate, $9.50; West Virginia smokeless, $8.25; Arkansas mine-run, $7; grate, $8.

No anthracite arrived during April, but about 500 cars were purchased. West Virginia was booked at $4 to $4.50 for about 500 cars for future shipment.

About the middle of the month the railroads bought up to the limit, and with a car shortage, cool weather, and a demand for storage, the operating interests discovered that they had oversold. The circular was accordingly withdrawn, no more contracts made, and prices began to stiffen. The buyers realizing what had happened began to clamor and the last week of the month saw the price advance $1 per ton on Standard coal. On May. 1 it was impossible to get prices or promises of shipment from almost any of the fields. Eastern coal shipments were cut off altogether and Arkansas was sold up to Aug. 1. Carterville coals had advanced now to the $3 mark for domestic sizes, and Standard to $2 and over.

Because of car supply and labor troubles the tonnage produced decreased in the face of a growing demand. The public began to get uneasy and besieged the retailers with orders. This brought the retail price to $6 for Carterville, while the advance was slight on the other grades. Steam coal was extremely active. The market eased up before June 1 on Standard, and Carterville went off about 25c.

In June easier conditions set in. Embargoes against Chicago sent a good tonnage of Standard into St. Louis. A little Carterville was offered, some anthracite came in, also smokeless, and some Arkansas grades. There was no demand to speak of, and no coal to offer. The month finished well. On July 1 the market was:

	Carterville	Mt. Olive	Standard
6-in. lump	$3.50	$2.35	$2.50@2.75
3x6-in. egg	3.50	2.25	2.50@2.75
2x3-in. nut	3.50	2.25	2.50@2.75
No. 2 nut	3.50	.....	.....
No. 3 nut	3.25	.....	.....
No. 4 nut	3.00	.....	.....
No. 5 duff	2.50	.....	.....
2-in. screenings	2.50	2.00	1.80
2-in. lump	.....	2.25	2.25
Mine-run	3.00	2.25	2.00

The Mt. Olive operators had a fixed price, regardless of supply and demand, but were entirely sold up. At the end of the first week in the month the market came to a standstill on account of persistent reports that the Government would cut the price. Consumers cancelled retail orders, hoping to save from $2 to $3 a ton, and the steam users did likewise.

The domestic demand had switched from Carterville to the other grades on account of prices. There was a feeling that the Peabody prices were too high. This was the cause of the slump.

A 15c. increase in freight rates to St. Louis was secured by the railroads, while increases to all other points were suspended. This annoyed buyers and tied up business.

Prices eased off some, and car supply got down to two days a week, except in the Mt. Olive district where a better supply existed on railroad coal. The month ended with railroads still getting the larger part of all the coal from the Standard field.

Attorney General McAllister of Missouri had been investigating St. Louis coal operators and the evidence was such that the public saw no reason why there should not be a cut in price. The newspapers had for months advised against buying coal, promising lower prices. Strikes in the Mt. Olive and Standard fields kept a light tonnage offered with no demand to speak of. Such mines as worked were getting cars for one day per week. Many commercial mines are being forced to load railroad coal or go without cars.

On the morning of Aug. 22 came the announcement of President Wilson's proclamation and then his selection of Dr. H. A. Garfield, as Fuel Administrator.

Retailers who stored coal suffered most. The operators insisted that the old high prices were good until Sept. 1. The secretary of the St. Louis Coal Club had to wire President Wilson to get information that the new prices were effective Aug. 22. On Aug. 21 the market was:

	Carterville	Mt. Olive	Standard
6-in. lump	$3.25@3.50	.....	$3.25@3.50
3x6-in. egg	3.25@3.50	.....	3.25@3.50
2x3-in. nut	3.25@3.50	On Strike	3.25@3.50
No. 2 nut	3.25@3.50	.....	.....
No. 3 nut	3.00	.....	.....
No. 4 nut	3.00	.....	.....
No. 5 duff	2.50	.....	.....
2-in. screenings	2.50@2.75	.....	2.50@2.75
2-in. lump	.....	.....	3.00@3.25
Mine-run	2.75	.....	2.75

Carterville rate, 87½c.; other fields, 72½c.

Orders at the old prices were promptly cancelled by most buyers. Mine agents turned jobbers, as did some operators. This upset the St. Louis market, and broke up many agencies. It was a week before business got settled and losses could be calculated on coal in transit.

The demand for coal at the new price was so great that it took everyone off their feet and overloaded the mines. Strike troubles in the Mt. Olive and Standard fields were settled. New retail prices caused some confusion, but business was good and all steam sizes offered found a ready market.

The latter part of September the situation took on a serious aspect. No one had stored much coal in July or August and now they wanted it. This applied to both steam and domestic grades.

There were no Eastern or Arkansas coals coming in. The Mt. Olive tonnage was on contract and while the car supply was better, there was little Standard to offer and almost no Carterville. The situation became such a critical one for the jobbers who could get no coal that they sent a committee to Washington to explain the local condition.

The last quarter opened with a strenuous market on everything. The steam demand was a big factor at this time. There was practically no coal coming in from the Carterville field, this tonnage being taken almost in its entirety by railroads.

Anthracite moved in only lightly and spasmodically. There was no West Virginia smokeless and the Arkansas operators got all they could, as there was no Government price on their product. No Pennsylvania anthracite was jobbed.

As the month wore on the situation became critical. There was no open market coal, embargoes were placed, cars were short, and transportation began to figure in the trouble. Cars were delayed for two and three weeks without cause. Railroad coal was given the right-of-way over everything else.

The car supply for the first half of November was exceptionally good, but the tonnage of coal mined was less per man than at any time in the last 15 years. Throughout this month the mildest of weather prevailed, and this was a wonderful help in a trying time.

The railroads began to confiscate high-grade coals, the tonnage of which was small, and failed to notify the consignees. The roads that make up the Terminal Association at St. Louis fell out with each other and there was a lack of coöperation.

The early part of the month brought some Pennsylvania anthracite, but outside coals were scarce after the first week. The retailer could get only Standard as a rule, and the consumer had to take it or go without.

The weather continued mild until about Dec. 10, when came the worst period of winter weather that St. Louis has had for many years previous to Christmas. The mercury went down to 8 or 10 deg. below zero and hovered around the cipher for about a week. The cold was accompanied by a heavy snow that tied up traffic, and completely demoralized transportation.

With no coal in storage on account of the general shortage that had prevailed St. Louis was for the first time since it became a big city confronted by a coal shortage. Factories closed, the Federal buildings were without coal, and the eight municipal coal depots, in the congested sections of the city, proved their utility by having enough fuel to dole out a bushel at a time.

The situation at St. Louis was taken in hand personally by Administrator Crossley on Dec. 15, and W. I. Jones, general freight agent in charge of coal traffic of the Missouri Pacific R.R., was drafted as traffic manager and put in charge of the work of getting the coal congestion loosened up. On Dec. 14 Dr. Garfield extended the Missouri jurisdiction to include the terminals of Kansas City, Kan., and of East St. Louis, Ill., and gave Lieutenant Governor Crossley power to take such action as he might see fit to get results from the Terminal railroads at these points.

A new order was put in effect that only one load of coal would be delivered to any home in St. Louis in a 21-day period. This was equivalent to the card system and enabled everyone to have a cheerful Christmas at least as far as a fire was concerned.

The coal haulers demanded an increase of wages which increased the retail price 25c.

The mine situation was not a satisfactory one. The roads were all embargoed against each other and the Terminal was so tied up that it did not know where it was headed. Cars laid around for two and three weeks and could not be moved. Empties could not be delivered to the coal roads, mines were idle, and such little tonnage as did come in was held up at East St. Louis for an indefinite delay.

The year ended with slightly better conditions existing and in prospect. What the future may hold is of course uncertain, but it is believed that if transportation difficulties can be straightened out there should be little cause for foreboding in St. Louis over the fuel situation.

Market Conditions in New England in 1917

By G. G. WOLKINS
Boston, Mass.

WAR demands chiefly characterized the twelve months ending Dec. 31, 1917. It was a year of uninterrupted strain in all channels and everyone was obliged to deal with the complicated uncertainties of a market taken under the wing of the Government.

Requirements of the Navy and other national services, imperative needs of the Allies, the enormously increased consumption by railroads and industries, and a public roused into accumulating fuel wherever possible, proved a combination that overburdened railroads while diminished water lines were inadequate to meet the demand. Add to these the momentous expedient of Government control and we have the outstanding difficulties of an unparalleled year.

General Features

In many ways the year can be reviewed as a chapter of innovations. Long-established practices were modified or given up, and new agencies created in a patriotic effort to "help win the war." The new factors, however, whether committees or fuel administrators, were under the disadvantage of a depleted market, practically dependent upon daily mining to keep wheels turning.

It was realized at the end of 1916 that New England was in for a hard season, but few had the courage to buy "futures" at prices then prevailing. Coastwise buyers have always been prone to "wait developments" and the early part of 1917 was no exception. It was apparent they would try every known way to get fuel at less cost than "spot" quotations. In other years when the volume of Hampton Roads coals was temporarily curtailed or prices were considered excessive, interest would naturally be shown in coals from Pennsylvania. But a year ago the Pennsylvania operators were quite as cautious as their Southern competitors and opportunities to cover grew increasingly rare as the situation developed during January.

The price differential was much in favor of the Pennsylvania grades. There was also well-grounded rumor that a heavy tonnage of Pocahontas would be withdrawn from this market for an industry that wanted the output of a group of mines, but even though this failed to materialize the Government appropriated a heavy volume of Hampton Roads coal and deliveries to this territory were materially reduced.

After January steam-users were much more concerned about getting supplies than haggling over prices. "Give us coal," was the cry. With the average cotton mill the cost of fuel, even in a year like 1917, was only about 3 per cent. of the cost of operation, leaving a 20 to 25 per cent. advance in the cost of coal at the boiler relatively a small item. Spectacular advances during March made the price tables the highest in the history of the trade.

From early February until Aug. 21 there were inter-

mittently present the usual makings of a "flurry." Extreme cold weather interfered with mining and with car movement, there was difficulty getting boats out of the Delaware and the Chesapeake, and together with increased consumption there was enough to accelerate an already insistent demand. Some distributors held the better grades for contract business, and for spot demand were willing to release only what inferior coals they were able to pick up. Even for short hauls car supply was much reduced.

Portland felt the shortage more than either Boston or Providence, and ice-embargoed ports like Bangor were heavily handicapped. Unable to get their accustomed quota in the fall consumers in such areas were obliged to draw on Portland earlier than usual. To add to the difficulties, traffic restrictions were rigidly enforced against reconsignments at the various New England gateways all-rail. It was the marvel of the trade that more was not heard about the distress of large industries, but from one source or another coal was always forthcoming to keep fire under the boilers.

Transportation Troubles

The acute railroad situation developed during 1916 was progressively bad during the twelve months following. The Norfolk & Western Ry. alone for the 11 months ending Nov. 30 showed a deficit in loaded coal cars, as compared with the same period in 1916, of 41,633, or 2,081,650 net tons. Such figures are regarded as the result of holding railroads in check as to revenues. They were not equipped with the locomotives, trackage, and terminal facilities that would now be a great boon to the country's needs.

Early in the year the Interstate Commerce Commission set out to secure a relocation of cars, and in an effort to clinch the matter defined a "diversion" in such way as to bring it within the statutory fine of $5000. The inequalities of car distribution usually fall hardest upon New England, partly because open-top cars here have no adequate return freight. In the usual course of trade, however, the roads receiving and not originating coal shipments have on their lines an excess over cars owned, while roads originating coal traffic ordinarily hold less than their ownership. Notwithstanding this, the Commission felt that roads having an excess of coal-car equipment should substantially reduce the excess when so requested. Instead, the percentages in many cases steadily increased. Particularly was this true of railroads in New England, with their additional coal traffic inland from Tidewater terminals.

To meet prevailing conditions the Railroad War Board evolved the priority order. A priority order was asked all-rail for New England but to the end of the year no favorable action was taken. Limited priority orders were served on certain mines in favor of certain utilities and plants, but priority request so accumulated as to defeat their purpose. The railroads themselves have been protected from the excessive use of priorities by their own priority director.

Water transportation has also been affected in discouraging ways. The destruction of shipping overseas has made necessary the taking of bottoms from the coastwise trade and sending them to help solve the freighting problem of France and Italy. Several steam colliers were diverted in this way, besides those commandeered by the Navy Department. Others would doubtless have been withdrawn but for strong protests. The Shipping Board intended to replace the vessels taken with certain foreign tonnage, but so far little has been accomplished.

The Shipping Board requisitioned all steam colliers of 2500 tons and over, D. W. capacity, effective Oct. 15, but allowed them to run under stipulated terms until the Board decided to use them in other service. Formal documents were signed in December. The serious phase of this for New England lies in the diminished tonnage that can come by water. If a single steamer of 8500 tons capacity is removed and not replaced, it means at the normal rate of loading more than 400,000 tons yearly is lost to consumers in this territory. When to this is added the commandeering of eight ocean-going tugs for war purposes it will be realized how hard hit are the industries in this part of the country. The railroads in New England were utterly unable to handle more than they did. Since their coal tonnage in 1916 was 50 per cent. greater than in any other year, there was no room for further increases.

On Dec. 28, Government direction of railroads became effective. If this will mean the pooling of equipment and therefore the better movement of coal to New England it will relieve a critical situation.

Coöperation With the Government

The trend toward Federal control was noticeable early in the year. In the seaboard trade the Federal Trade Commission began in April to exercise its broad powers by seeking to change radically some of the selling methods that had always prevailed. Cumulative commissions and the frequent transfer of shipments en route were frowned upon, and there was also an effort to restrict operators to the consignees for whom they were the usual sources of supply, rather than allow the coal to go to the more attractive markets. Later a system of frequent reports was put into use; and with salutary effect, particularly on anthracite. The object, of course, was to protect the consumer, and that feature of the work was thoroughly done. The coal houses responded with good grace, for the most part their coöperation has been of the best, and the rules laid down as to reports were closely followed. One result has been a better regard for the functions of middle houses, or "jobbers," and it is believed the supervising authorities have learned there is nothing more harmful among reputable coal commission houses than among reputable banks, or other institutions that exist upon trade in commodities which they themselves do not produce.

One of the early efforts on the part of the railroads was to pool all the bituminous at the various Tidewater loading ports. A similar experiment at the Lake ports had met with moderate success. The Committee on Coal Production of the Council of National Defense had quietly done much in smoothing out rough places in the relations of the departments at Washington with the coal interests; it was later enlarged to include labor representatives, and in general it showed grasp of the problem. In brief, the Tidewater Coal Exchange was organized, with Rembrandt Peale as commissioner,

and all the mines accessible to Tidewater were classified according to railroads and quality of output. It was stated at the time that the total Tidewater tonnage during the year 1916 was about 31,000,000. If the detention at Tidewater piers which was then averaging about 5½ days could be reduced by pooling to 3 days another 6,640,000 tons more could have been moved with the same equipment, or it would have made available 133,000 cars for other coal movement.

Instead of all the separately designated coals, more than 1100 in number, sent to the Atlantic loading piers, it was proposed to limit the number to 41. That is, 41 different numbers would designate all the bituminous for dumping at all the piers, classified according to a schedule in which mine origin, proximate analysis, probable use, and merchantable value were taken into account. At all the piers, whether at Hampton Roads, Baltimore, Philadelphia, or New York, "No 1" was coal originating at mines on the Navy Acceptable List, whether Pocahontas, New River, Georges Creek, or fuel administrations. Representatives of the coal trade were invited toward the close of the year to help in the office of the New England Fuel Administrator and they coöperated to such extent as they were permitted.

As the year closed measures were on foot to secure an emergency supply in Baltimore and Philadelphia piers, but by Dec. 31 the full detail of transportation had not been worked out. The twelve months together formed such a continued record of stress and helplessness as the coal trade had never known. And the end is not in sight.

Pocahontas and New River Grades

The Hampton Roads terminals never seemed so remote from New England as in 1917. The vicissitudes of shipping and the war needs of the Government made it particularly trying for all who were concerned in getting coal from that quarter. Operations in the districts accessible to Norfolk and Newport News were at no time embarrassed through lack of labor; it was al-

Cambria. Other classifications were of like significance and showed intelligent discrimination.

For four months membership in the pool was voluntary and a large number of shippers withheld support. On Nov. 6, participation in the Exchange was made mandatory by order of the Fuel Administration. Thereafter, certainly, none of the shippers could be blamed for any failure of the remedy offered. The pool was enforced at a time when terminal conditions were extremely bad, and due allowance should be made an expedient for which perhaps on the whole too much was claimed.

A New England Coal Committee was organized as early as April through the coördination of the governors of the six New England States and as a branch of the Massachusetts Committee of Public Safety. From this committee was evolved in the fall the New England Fuel Administration. Cases of actual seizure of coal were few and unimportant, up to the end of 1917. As in other parts of the country local fuel committees were appointed for communities of 2500 or more population. Cases where prices were reduced were rare in New England. Supervision of local retail prices and a service of intercession for various dealers and consumers with their usual sources of supply were, in practice, the chief functions of the various state most exclusively a shortage of equipment and facilities that made the three big arteries appear so inadequate.

Strained conditions at the beginning of the year were without acute developments. Irregular car service was causing 2 to 4 days' detention, and spot coal sold at $7@7.50 f.o.b. vessel. Bottoms were hard to get and for that reason spot demand was intermittent, though firm. In fact, through the whole year the only really pronounced spot demand was from shippers themselves who required part cargoes to clear their ships. Demurrage rates had grown so heavy it was common practice to pay what might otherwise have been considered exorbitant prices purely to free a ship from extra detention. Without boats in hand no buyer was in position to take delivery f.o.b. vessel, and no buyer was so rash as to commit himself on 1917 charter terms unless he had good assurance the coal would be forthcoming.

The attitude of the agencies toward annual contracts was developed early. Many of the supply arrangements that would expire Apr. 1, 1917, were undertaken in October, at prices based on $2.70@2.85 f.o.b. Norfolk. Conditions in January were expected to carry through at least to June, and export and bunker business would furnish the demand needful to keep prices strong at the season basis, $4.75, a full $1.75 up from the 1916 "asking" figure. No rush was expected, but yet New

England was restricted as to sources of supply, and numbers of buyers thought, and wisely, that it would be prudent to cover while the going was good.

Only a modicum of the volume sold in this territory was placed at alongside prices based on direct barge delivery. A few such contracts there were, later on, at prices from $7.65@8, depending upon destination and allowing $2.90 for water freight and insurance. The bulk was given buyers who had taken similar delivery the year previous, and to those only a percentage of their 1916 quota. The available bottoms were in few hands, and as to rates it was not so important whether $2.50 or $2 should be set. Obviously there would not be enough sail or barge tonnage open to season charter to affect materially any rate made on steamers. A sellers' market it was bound to be, although most buyers were slow to sense the prospect. Differentials favored all-rail delivery, and a drive was made to interest large plants in medium grades from Pennsylvania, but the regularity of steamer deliveries had its appeal and a liberal tonnage was soon signed up, at first on a $2 freight basis to Providence and $2.25 to Boston, or respectively $7 and $7.25 f.o.b. cars, but a fortnight later reduced to $7 flat at both points. Prices for spot delivery inland were then $9.25@9.50, as a comparison. Shippers were diffident as to the tonnage placed; it was as if they had simply wanted it said that all their customers had been favored with opportunity to buy; and on the purchasers' part the only delicate feature seemed to lie in the speculation whether some competitor in the same line of manufacture might pay less, by waiting.

Bottoms Commanded Good Rates

Factors equipped with transportation as well as rehandling facilities let it be understood they might prefer letting their boats for the export trade on the extravagant freights that offered, allowing their forwarding plants to lie idle until the coastwise market should get normal again. They yielded, however, to some of their established trade, and on their free coal at spot prices have netted more on their ships than if they had chartered offshore. Contracts for delivery in lighters were closed, ranging from $7.60@8.50. Other regular sources of supply offered to carry customers through the season, so far as conditions would permit, and prices to be adjusted monthly on basis of cost; others would not respond at all to importuning for contracts. There were too many possibilities.

By this time prices at Hampton Roads had eased to nearly a $6 basis, although shippers were just as guarded about commitments. Then came the uncertainty caused by war probabilities and the likelihood that a number of the steamers that New England had now grown so dependent upon would be withdrawn. For buyers who faced the market squarely there was no real encouragement that Pocahontas and New River would soften. Meanwhile, spot inquiry was broadening noticeably, and the volume of free coal was rapidly diminishing. The Government enforced its privilege of prior loading, but few New England consumers were alive to the situation and many felt levels were now so high they could lose little by waiting. All options on a delivered basis were definitely withdrawn, and current figures f.o.b. Boston reached $11. There were also intimations that the $4.75 base might be advanced $1, although for the twelve months the only additions were 10c. advance in tolls, the war tax, and the wage increase that was added by some of the shippers. At the end of February a week's detention was the rule and loading got increasingly difficult to arrange. Frequently eight or nine agencies would be called upon to dump for a single cargo. And all the time the Government was likely to drop on them for heavy tonnages on short notice.

Boston on-car prices touched $15, the same price being paid for lighter loads. The Bangor & Aroostook R.R. cancelled passenger trains and for one period had solid trainloads rushed all-rail from the mines.

The approach of mild weather had its usual effect upon prices, which dropped f.o.b. to a $5.50@6 range, largely on coal in the hands of less prominent agencies. Buyers, however, were only hoping against hope when they postponed purchases. It was now practically impossible to get taken care of on an annual basis. Sales were made at market price at time of shipment and other terms were carefully phrased. Shippers were certainly in position to pass the risk along to consumers. Aside from the endeavors of the railroads and a few large mills there was apparently little effort to get coal forward.

Navy Requests Large Tonnage

Meanwhile, anxiety increased among shippers because of Government requisitions which by May 1 were heavy. The Navy asked operators for 1,000,000 tons. In addition there was extra demand from the West. Nevertheless, until October contract requirements were met with reasonable promptness.

The upward trend was again pronounced in May. New England mills were driven with business and even with a great accession of water power they were just able to keep moving on hand-to-mouth deliveries. Occasionally a spot cargo met with ready sale at high prices, but such transactions were quietly arranged, neither party seeming anxious to spread the fact. Two dollars and ninety-five cents gross tons f.o.b. mines was the "taking" mentioned at that time in connection with Government requirements, this basis figuring $4.45 at Hampton Roads. The upset spot price had now swollen to $8.50. In June the Navy Department made known its wish for the 1916 contract level plus labor and other extra costs being paid in 1917.

Relatively easy freights helped the coastwise consignees to quite an extent during the summer. The demand for coal was so insistent that the agencies only piled up trouble for themselves when they yielded to a natural inclination to sell the utmost possible when spot prices crept above $7. The possibility of Government action was an accelerator for production as long as spot orders lasted.

The $3 mine price "fixed" in June was in effect a scaling down of spot prices to within 30c. of the season contract level of $4.85 f.o.b. Hampton Roads, now that the advance in tolls had been added. The Pocahontas and New River operators faced no particular embarrassment, however, especially when there was conflict of opinion in high circles. Practically all the output they could count upon was affected very little and shipments continued as before. For the rest of the

year, receipts were applied to contracts, after Government requisitions and bunker demands had been met.

Much alarm was caused by intimations in August that certain of the 8500-ton steamers regularly bringing smokeless coal would be taken for overseas. It was figured that the tonnage for the ports of Providence, Boston and Portland approximated 8,000,000 tons. Of this about 2,000,000 is carried in barges, leaving 125,000 tons weekly to be brought in steamers. A few ships were withdrawn from the trade and the tonnage has been impossible to make up.

The Fuel Administration's grant of 45c. increase per net ton to cover wage increase had no material effect upon Hampton Roads coal for New England. The manufacturer who failed to contract for an adequate supply prior to Aug. 21 had a poor outlook for requirements.

Loading dispatch grew slower as the year drew to an end. The Tidewater Coal Exchange as a unit is not quite the equal of a few large shippers all keenly alert to get coal forward and using all their powers to that end. Notice was served on certain mines to ship 100 per cent. on contracts for tonnage destined to New England in an effort to relieve the impending famine, but movement had to be via Tidewater piers and with upward of 100 bottoms waiting to load the prospect was not cheering. Moreover, preferential shipments along the same lines, except in a few cases for railroad fuel, had not been brought about at the end of December.

Export and Bunker Trade

The volume of commercial off-shore business the first half-year was limited only by the number of ships available. Many of the figures covering this trade are not available and if they were it would be difficult to separate cargoes that were purely commercial and those loaded in pursuance of war needs. Ocean freights remained so high that to coal factors who controlled ships the opening was most tempting. There was also a prospect of building up future trade. The maximum price was always to be had and without the risks that accompany delivered prices in the seaboard market.

The diminution of ocean tonnage early in the summer had its effect upon the volume exported, and on June 27 the President issued a proclamation requiring all exports to be licensed. This applied to bunker coal, the Government's object being to force ships into necessary trades and draw out other vessels from neutral and Allied harbors. Effective July 15 another order provided for complete Federal control of exports, including coal and coke, and each shipment was to be specially licensed, the license to be issued only after full details had been given, and subject to renewal after 60 days. Bunkering in the stream at Hampton Roads was put into practice under supervision of the Shipping Board, in order to provide berth room for cargo boats.

Operators in conference with the authorities insisted in the fall that the authorized basis was on too low a level to insure the steady output needed. For bunkering, the prescribed price, war tax and all, figured about $3.80 f.o.b. Norfolk before the wage increase was allowed, while the season's contract cargo price was $4.85. Attention was called to the 30s. (about $7.30) basis f.o.b. Cardiff, authorized by the British government, and the discrepancy declared too great. As a result, the Fuel Administration authorized a $1.35 advance, with charges on a new basis, and plus the 45c. wage increase previously allowed.

Pocahontas and New River operators certainly enjoyed a prosperous year, even though tonnage was somewhat curtailed through failure of car supply. Manifestly, 1918 will see far-reaching changes in distribution. The trend is toward the diversion of most of the "No. 1" coals to Government use, leaving other grades for other consumers. New England will probably have to look to Pennsylvania for its major supply, although it is to be hoped that something will be done for, or to, the railroads first.

Georges Creek Coals

The shippers of Georges Creek made relatively so few deliveries in New England during 1917 that they about ceased to be a factor in the coastwise market. Receipts of this grade were light from the beginning of the year and except for scattered instances were applied to contracts taken mostly in October, 1915, contracts on which the chief distributors were far in arrears on Apr. 1, 1917, the date of expiration. Utilities, mills and dealers who had the coal due them insisted upon deliveries being made, and one way or another during 1917 unfulfilled obligations were adjusted. What tonnage was sold here was confined to individual cargoes, few and far between. In spite of all that was accomplished in other years to build up a coastwise business, Georges Creek had become negligible as a source of supply.

All-rail deliveries were of no moment. Cars dribbled through but insufficient in number to please anybody. No season prices were named and steamers and barges were placed trip by trip, usually at Hampton Roads and other ports where coals other than Georges Creek could be lifted. In March an advance of 17c. and a fraction was added to the 1916-17 contract basis to cover a wage increase. By April it was evident that all idea of naming prices had been abandoned. Except for

Government purposes there was none of this grade for the open market at any of the loading piers, although in June a few cargoes were sold at $11.50@12 alongside.

As high as $7 f.o.b. mines was named for prompt shipment and inasmuch as the President's order of Aug. 21 did not apply to coal for forge use there was no material reduction the balance of the season. For the present there is no reason to suppose shipments to this market will show any increase or any regularity during 1918.

The Pennsylvania Grades

Central Pennsylvania was prominent in the minds of New England buyers throughout 1917, although as a source of free coal it practically disappeared after the price-fixing proclamation of Aug. 21. From Jan. 1 it was plain that the Northeastern market would have to look to Clearfields and Cambrias to piece out the supply of Pocahontas and New River for the region accessible to Tidewater. The volume of business handled by the all-rail agencies the previous twelve months encouraged many large consumers to buy even the inferior grades for the sake of getting fuel forward while it could be had. Although shippers of the more favorably known coals were obliged to restrict their customers to less than 1916 quotas, those in position to ship ordinary varieties, even those high in volatile and ash, did a handsome business in this territory.

A few important Pennsylvania factors took on business early in January for twelve months from that time, but the "contracts" were well hedged as to labor, car supply, and other contingencies. Several comprehensive orders were placed in this way at from $3@3.25 f.o.b. mines. Notwithstanding spot figures at the time ranged from $5.90@7, depending upon grade, a large number of big buyers thought the contract level too high and postponed purchases.

Numerous local labor adjustments were characteristic the whole year. These had a marked bearing on prices, but even with sundry wage increases Pennsylvania coals still had the advantage over water-borne coals from the South. Rail coal was a factor therefore in territory hitherto regarded as exclusively supplied by water and transshipped inland. But in spite of a most discouraging outlook as to labor a creditable year's record was made.

In March the railroads were obliged in several cases to withhold cars except for engine fuel. Embargoes were intermittent and prices for shipments en route continued up to $7. Tidewater deliveries were also difficult to arrange, one cargo selling in Boston at $11 alongside. Quotations all spring were pitched to a high key, although for intervals the spot demand would flatten materially, except for loading at Philadelphia and New York where any surplus was readily absorbed. Mine prices were down to $4 for deliveries through the summer months, and yet New England buyers showed their customary hesitancy.

In April all producers were hard put to it to meet even the most urgent demands. Far-sighted operators were now adding to the "blue ribbons" already attached to sales a clause covering any tax that might be imposed on coal for commercial use. Mills working on Government orders did everything possible to get fuel forward on a preferred basis, but operators on the other hand who normally are heavy shippers to New England found so large a share of output requisitioned by the Government many were obliged under labor and car conditions to cut off practically all their commercial obligations. And again, so little transportation was available outside of anthracite barges that sellers knew the traffic would bear high prices and for several weeks $8.75@9 f.o.b. Philadelphia was a regular price when coal was available for prompt dumping and went through several hands. It is common experience that high prices will draw out coal, and that was true the first half of 1917.

When labor difficulties got ironed out, a better movement followed. Orders had accumulated and there was a rush demand for cars. Most buyers were cautious and bought only for urgent needs. Those under contract were waiting to see if shippers would make good; others were hoping prices would recede enough to make comprehensive purchases. Neither class was wholly justified in its attitude, and those who failed to buy the coals then offering for spot shipment, even the high volatiles that had been attracted by the active demand, were in distress in the fall.

In June the Tidewater Coal Exchange was organized and for the most part it worked favorably at both New York and Philadelphia. Shippers have since been saved considerable items of demurrage at the piers, and there has not been the fault found that was usual at Hampton Roads.

A heavy volume of free coal came to New England from the Cambria, Clearfield, and Indiana districts, as well as from Pittsburgh, during June, July, August, and September. After Aug. 21, however, new sales were for the most part discontinued. By December the accumulation of priorities had set in, and only a small percentage of output was left for deliveries on the season's commercial contracts.

High prices, continual labor adjustments, and Government control of output were three features of trade from central Pennsylvania, so far as it related to the seaboard market in 1917.

Announcement to Hungarian Miners

On page 208 of this issue appears an announcement to Hungarian miners of which the following is a translation, which translation has been duly filed with the New York post office with the affidavit that is required by law:

In any country when war commences, everybody belonging to the country of the enemy is interned.

The United States has not done this. It will not intern Hungarians so long as they continue at work and make no trouble.

No one who does his duty will lose his job. Everyone will be as well treated as if he were a citizen of the United States, so long as he behaves himself.

He will not be deprived of his savings or his property. Hungarian miners have, therefore, reason to be grateful to the United States for its generosity.

Hungarian miners can show their good will by working steadily and quietly. This nation and the mine owner heartily appreciate the services of those Hungarian miners who have labored steadily to get out a large quantity of clean coal.

Résumé of the Anthracite Industry in 1917

By H. M. CRANKSHAW
Manager, Cranberry Creek Coal Co., Hazleton, Penn.

THE year 1917 has probably done more to shake up and modernize the anthracite coal industry than any two previous years in its history. The demand for coal, which has insured steady operation for the mines, has enabled the industry to settle down and devote every energy to output, with a resultant increase in production, in spite of a decrease of about 15 per cent. in the number of men employed.

During the past year every operation has been striving to employ mechanical devices which could be commercially used to advantage wherever possible. This has meant the increased use of electricity in almost every form. Electric shovels, electric hoists, together with electric drives for breakers and other machinery, have been installed without question. It is not now a question as to whether electric or steam power should be used, it is more a question as to where power can be obtained and how soon electrical appliances can be purchased. The electric power companies no longer ask where they can sell their power, but where they can get more power to keep up with the requirements of their customers.

Fig. 1 shows a modern hoist of first-class construction. This hoist handles two cars per trip on a slope, having a maximum pitch of 36 deg. with a rope speed of 1750 ft. per minute. The distance down to the first lift is 1020 ft., and the second lift, which will be 1400 ft. from the dump, will soon be opened up. The hoist is equipped with overhoist control post brake and 650-hp., 2200-volt, three-phase, 60-cycle motor and has a capacity of 80 cars per hour.

Fig. 4 shows a small electric hoist for a small isolated slope, handling one car per trip on a maximum pitch of 45 deg. with a rope speed of 500 ft. per minute. This hoist is equipped with a 150-hp., 440-volt, three-phase, 60-cycle motor and has a capacity of 125 cars per day. When coal is hoisted on slopes by electric power, which is paid for by meter, it naturally does not pay to use cars with antiquated stiff bearing, adding an appreciable amount to the tractive power required to pull the load. The logical thing to do is to use roller-bearing cars or cars with a good modern bearing. In this connection it does not pay to mix roller-bearing cars with other rolling stock, but a smaller mine or opening should be picked out and equipped entirely with roller-bearing cars, then comparative costs should be worked out.

Fig. 3 is an illustration of a modern roller-bearing car with strong wooden underframe, straight steel sides and bottom. This car is easy to repair in case of a wreck and has a wooden door.

Fig. 2 shows a small electric shovel at work handling waste bank. This shovel is a one-man revolving type with a 1-yd. dipper, being very economical and useful where a small shovel is required. It has a capacity of 400 tons per day handling waste bank, and is run entirely with one 20-hp. motor. This means a small cost for power, and as there is nothing to freeze up the shovel can be operated in the worst winter weather

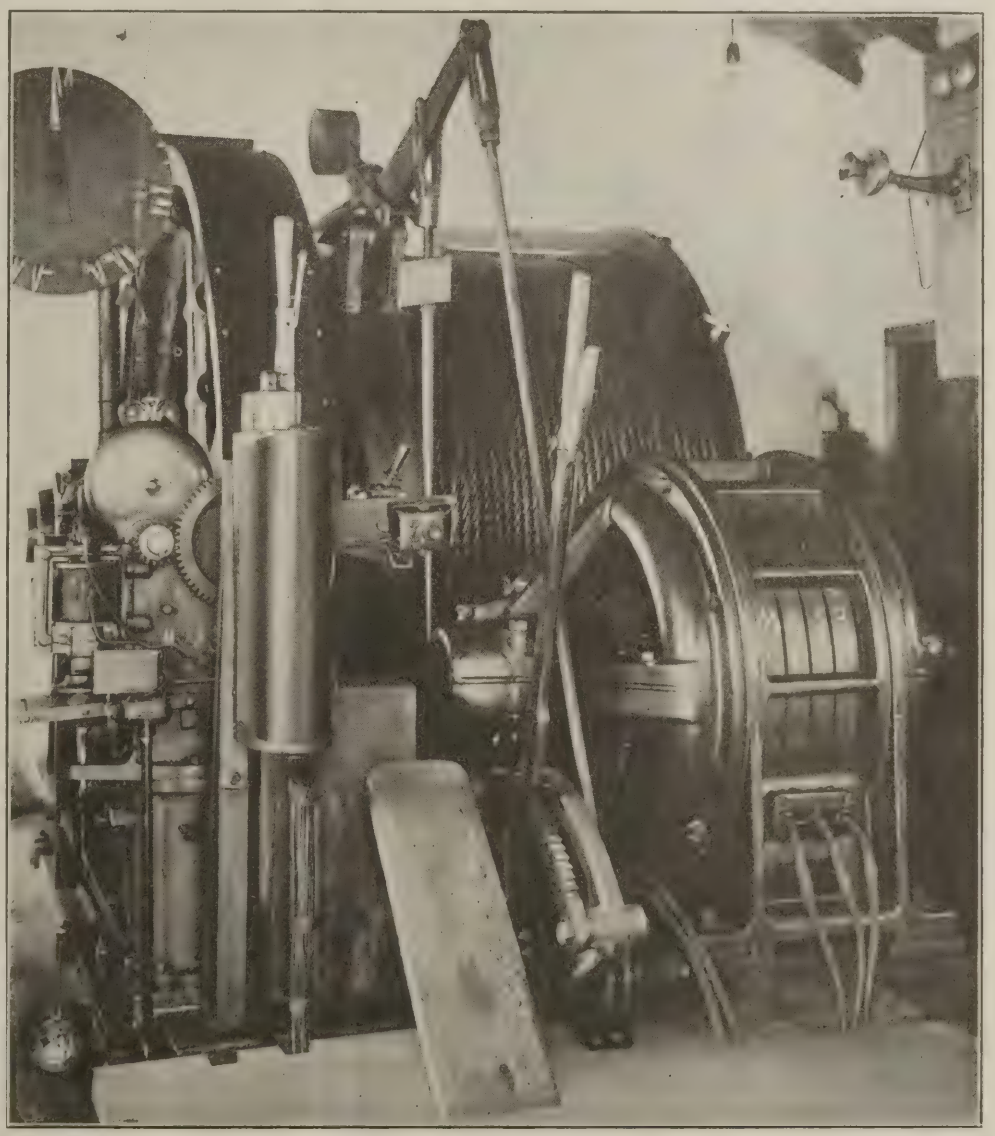

FIG. 1. MODERN HOIST OF UP-TO-DATE CONSTRUCTION

without the delays experienced in running a steam shovel.

The illustrations referred to give some idea of the manner in which modern appliances have been and are being applied to the anthracite coal industry in order to speed up production. While there has been a ready market for all sizes of coal during the past year the selling end of the industry has also seen some extensive changes. Early in the year, when it became apparent that there was a shortage of coal, fuel speculators boosted the prices with the result that in May the Federal Trade Commission started an investigation. The results obtained were beneficial in curtailing speculation, until finally, in the latter part of August, the proclamation by President Wilson named Dr. Garfield as Fuel Administrator and fixed the prices of anthracite.

This, in one stroke, removed all doubt, put the industry on a settled basis and entirely eliminated all possibility of speculation in anthracite. The price fixing has been beneficial to the anthracite industry, inasmuch as it has tended to abolish the weaker middlemen, who by speculating in coal get the industry into ill repute.

Labor has had substantial increases during the past year. In 1916 a four-year contract covering the rate of wages to be paid was signed between the mine workers and operators. Early in 1917 it became apparent that as other industries were paying higher wages and as 20,000 men had already left the anthracite industry, something should be done to pay the workers in the anthracite region higher wages. A conference was therefore held, and in May, 1917, a war allowance was given the mine workers, which amounted to 23 per cent. for the lowest-paid labor.

After Dr. Garfield was appointed Fuel Administrator it became apparent that the mine workers were not yet receiving enough wages to equalize the high cost of living and other war conditions. Consequently, another conference was called and a further war allowance of 28 per cent. was given, the additional allowance to be paid from Dec. 1, 1917. The percentages quoted are for the outside laborers, who previously were the lowest paid of all employees in the anthracite industry. The total increases given the contract miners amount to 25 per cent.

The transportation of coal to market has brought out some interesting changes. Throughout the year

FIG. 3. MODERN ROLLER-BEARING CAR
Bearings are Whitney roller bearings made by Sanford-Day, who furnished wheels and axles

almost every conceivable scheme has been tried to facilitate the transportation of coal. The old system of placing embargoes on almost every line connecting with the one on which the shipper is located was finally abandoned as a failure.

Keeping certain cars on certain lines and returning same to point of origin empty was also tried out and abandoned. Finally the car supply got worse, until Government control of the railroads was declared by President Wilson, effective Jan. 1, 1918. A few days before this all car restrictions had been removed so that cars could, as much as possible, travel with a load.

We, therefore, have passed through a year in which old prejudices have been wiped out, all tonnage records beaten by 10 per cent. with a labor shortage of 15 per cent., and a year which in general has been beneficial to the industry inasmuch as it has tended to put it on a more efficient basis, comparable with the bituminous coal industry or the steel trade.

Colliery Notes

IN 1915 THE RAILROADS used 128,000,000 tons of coal. The coke ovens require 62,000,000 tons and manufacturing and power plants 180,000,000 tons. The domestic consumption was 100,000,000 tons. The balance of the 510,000,000 tons produced was used in miscellaneous ways.

RUSSIA'S PRODUCTION OF COAL during 1913 amounted to about 31,000,000 tons and in 1914 to 28,000,000 tons. As the Polish districts, which in 1913 yielded 22 per cent. of the aggregate output, are now occupied by Germany and Austria-Hungary, Russia's production of coal for 1915 cannot be estimated at more than 20,000,000 tons.

THE COAL INDUSTRY is the most important industry next to agriculture. It employs more than 750,000 men, furnishes 65 per cent. of all the traffic for the railroads and has made possible our great industrial development. It should receive attention in proportion to its importance, and though one-half the size of the agricultural industry, the United States spends less than one-eighth as much on the mining industry as for agriculture.

AN INTERESTING COMPARISON in the value of coal compared to fuel oil, natural gas and producer gas can be made when the heating furnace is not considered. Assuming coal to cost $2.50 per ton, cost of drying 50c. per ton and B.t.u. contents 14,000, then fuel oil having 140,000 B.t.u. per gal. would have to sell at 1½c. to make the same cost. Natural gas would have to sell at 11½c. and produce gas at 2c. Therefore, if powdered coal could be burned commercially, it would be the cheapest fuel.

Coastwise Shipping Conditions in 1917

SYNOPSIS — *Notable lack of tonnage throughout the year. Government requisitioning of ships and shortage of coal made 1917 an unparalleled year for transportation. Rates high, but less chartering than in 1916. Government fixing of steamer rates.*

THE year 1917 saw a considerable withdrawal of coastwise colliers for overseas transport. Several steamers were either requisitioned for immediate use by the Government or were sold with the Government's approval to syndicates representing France and Italy. The "Tidewater," one of the largest, was sold for $2,600,000, a fair indication of the market value of modern ocean carriers. Late in the fall a number of old-type steamers of Norwegian and Danish registry, together with colliers from the Lakes, were put into the coastwise trade to relieve the tense fuel situation caused, among other factors, by the lack of shipping.

Government Carefully Considers Question of Requisitioning Boats

Requisitioning of coal boats was gone into carefully at Washington. Conferences dealt with the subject in April, in an effort to see whether such drastic action could be taken without such an upset of all-rail service as would cause this territory to suffer acutely. Except for the old "hookers" that are still in service to shoal points the sailing vessel has almost entirely disappeared from the trade. In volume greater than ever before New England relied upon modern steamers for bringing fuel from Hampton Roads, and the withdrawal of ships together with the shortage of coal at Hampton Roads gave a serious turn to the steam coal situation. However, fewer ships were taken than at one time seemed likely, and had the coal reached the piers in better supply receipts at this end would not have been so far in arrears. At the end of December more than 100 boats were waiting for cargo at Hampton Roads and demurrage was accruing to sizable amounts.

As in 1916 the trend of coastwise freights was upward, especially the first half-year. A market rate of $2.50 in January on 5000- to 6000-ton steamers rose in April to $4.25, as high as $5.25 being paid on a 1000-ton barge to Boston. The Government accepted a bid in freighting 10,000 tons to coaling station at Melville, R. I., from Hampton Roads at $3.75, 5 days loaded and discharged, demurrage 25c., dispatch 7½c. Small steamers chartered at $6 from Hampton Roads to Gardiner, Maine, 5 days to load and discharge, 8c. per ton per day.

One of the developments of the year was the acquisition by interests allied with the Consolidation Coal Co. of the Coastwise Transportation Co., reorganized under the name of the Consolidation Coastwise Co. The latter now owns the "Plymouth," "Norfolk," "Suffolk," "Bristol," "Hampden," "Middlesex," "Coastwise," "Transportation," and others.

There was probably less chartering in the open market than had ever been the case previously. Steamers were about the only transportation available, and aside from those filling in coastwise trips between trips abroad or to South America, bottoms were extremely scarce. Even in cases where one or two trips coastwise would be arranged the holders considered the ships worth more to themselves than for charters in the open market. On the other hand cargoes were difficult to arrange. War risk at advancing rates was a factor the first half-year, although in December things had come to such a pass that incidental items like insurance or demurrage were hardly considered; they were just paid. The usual rate of demurrage on 5000- to 6000-ton ships figures now about 20c. per ton per day.

Complaints That Barges Were Not Moving Results in Formation of Towing Agency

In June rates receded temporarily and a still hunt for a ship might have produced one at $3 flat. A month later barges were taken at $2.50, the lowest barge rate of the year, from Hampton Roads.

There was a fair supply of barges, partly because some shippers declined to name season rates on their transportation, and also because of the number of barges in the open market that under normal conditions would have carried anthracite. Several bottoms were attracted to Southern ports by rates on lumber and ties.

Growing out of complaints that tows were not moved with dispatch and as a result of a hearing before Commissioner Stevens of the United States Shipping Board the different owners pooled their equipment and organized the New England Barge Owners' and Towers' Association. The difficulties in the way of carrying out the theory of such a pool are many. It was figured that about 2,000,000 tons yearly were carried in barges, leaving only 125,000 tons per week to be brought in steamers to Providence, Boston and Portland.

Shipping Board Takes Over Many Ships

Effective Oct. 15, the operation of all coastwise colliers above 2500 tons D. W. was taken over by the U. S. Shipping Board that commandeering might not be subject to delay, should the situation warrant. A rate of $2.50 was established to Boston, although in December this was advanced to $3. The Government paid the owners on the basis of $6.25 per ton and collected freight on the basis of $2.50 or $3, as the case may have been. The original arrangement was for 90 days but has since been confirmed. On prior charters the holders are entitled to have their ships resume contract obligations when the Government releases them. In December the Boston rate advanced to $3.

Barge rates to Long Island Sound, New York loading, hovered around $1.25@1.35 most of the year. When they advanced to $1.50@1.75 it was usually because coal was immediately available at the piers.

Four dollars was the ruling figure from New York to eastern Maine, but during the summer it was shaded to $3. Few season contracts were taken during 1917. Every owner of transportation is inclined to charter only from trip to trip, so rapidly are conditions undergoing changes.

Mining Chronology of 1917

By R. Dawson Hall

Jan. 1—Central Pennsylvania operators commence paying 10 per cent. bonus.

Jan. 13—Explosion at Fushun colliery, in Manchuria.

Jan. 22—Rocky Mountain Institute meets.

Jan. 30—Allegheny Valley Operators' Association agrees to give the same 10 per cent. bonus granted in other parts of central Pennsylvania.

Feb. 3—Diplomatic relations between the United States and Germany suspended.

Feb. 5—Fowler bill sponsored by United Mine Workers introduced into Pennsylvania House of Representatives. It called for the appointment of 25 assistant mine inspectors in the anthracite region.

Feb. 9—Statewide Prohibition Act signed by Governor Goodrich, of Indiana.

Feb. 10—New wage scale in Connellsville region goes into effect.

Feb. 13—The Illinois Senate passes a measure providing that statewide prohibition be voted on by referendum at 1918 general election.

Feb. 19—John Franklin Fort, of New Jersey, and William B. Colver, of Minnesota, nominated for Federal Trade Commission by President.

Feb. 19-22—American Institute of Mining Engineers meet at New York City.

Feb. 21—Senate measure forbidding shipment of intoxicating liquors into states which prohibit the manufacture and sale of such liquors is passed by the House. As a result 19 states become "bone dry."

Mar. 2—New coal-mining act in State of Washington signed by governor.

Mar. 3—Daniel Willard, the president of the Baltimore & Ohio R.R., becomes chairman of Advisory Committee of the Council of National Defense.

Mar. 6—Two indictments were returned by the Federal Grand Jury against 64 coal operators and 108 coal companies.

Mar. 7-9—Canadian Mining Institute meets at Quebec, Canada.

Mar. 13—Mine explosion at Henderson No. 1 mine, Hendersonville, Penn., in which 14 men were killed.

Mar. 25—The President orders the personnel of the Navy increased 18,000 and begins to call out regiments of the National Guard.

Mar. 26—Special convention of District No. 2 (central Pennsylvania) met at Du Bois, Penn., to discuss proposed wage increase.

Mar. 28-29—New England Coal Dealers' Association meets at Boston, Mass.

Mar. 30—Wage agreement completed in District No. 17, covering Kanawha field.

Apr. 1—A large number of contracts at low prices expire, and the corporations hampered by them begin to make large earnings. The day is hailed as "Emancipation Day."—New wage scale in Connellsville region goes into effect.

Apr. 2—President asks Congress to declare that a state of war exists with Germany. — Tuscarawas district grants an increase to the mine workers.—Indiana "goes dry."

Apr. 4—Senate passes resolution declaring that war exists.

Apr. 6—House of Representatives passes resolution declaring that war exists. President Wilson signs joint resolution.—John P. White, J. C. Kolsem and F. C. Honnold call for a conference of operators and mine workers in Central Competitive region.

Apr. 12—Conference of mine operators and mine workers of Central Competitive field meet in New York City. —The War Department practically makes a call for 500,000 volunteers.

Apr. 17—New wage scale in Central Competitive region is signed. Pick and machine mining is raised 10c. per ton; day labor is raised from $2.98 and $3 per day to $3.60; trappers wages are advanced from $1.57 to $1.90. Deadwork and yardage are unchanged. To be effective as from Apr. 16.

Apr. 18—Explosion at Lynden mine, Mason, W. Va. Lightning ignites powder in powder house and kills 5 persons.

Apr. 19—The Interstate Commerce Commission grants railroads permission to file tentatively 15 per cent. increase in freight rates pending hearings and ultimate decision of commission.

Apr. 21—Anthracite wage conference begins.

Apr. 24—Block-coal operators of Indiana (District No. 8) complete their scale.

Apr. 25—Anthracite mine workers obtain wage raises of from 11 to 35 per cent., the men with lowest pay getting largest increases.

Apr. 27—Mine explosion occurs at Hastings mine, Hastings, Colo., near Trinidad. In this accident 121 men are killed.

May 1—Anthracite operators testify before Federal Trade Commission at Washington, D. C.—A 20 per cent. increase in wage, granted by West Kentucky Coal Operators' Association, becomes effective.—Increase of wage in Missouri, Kansas, Oklahoma and Arkansas equal to that granted in Central Competitive district becomes effective.—New wage scale in Connellsville district goes in effect.

May 2—Anthracite jobbers and retailers testify before Commission.—Illinois operators complete agreement with mine workers.

May 3—Central West Virginia Coal Operators' Association grants an eight-hour day in the Clarksburg-Fairmont region with substantial increase.

May 5—Miners in District No. 18 (Western Canada) vote in favor of new wage-scale agreement, granting 12½ to 20 per cent. increase over previous agreement.—Two operating companies in Flemington district, West Virginia, grant mine workers eight-hour day, short-ton basis and wage increase of approximately 14 per cent. Others sign June 12.

May 7—Interstate Commerce Commission begins its hearings relative to the plea of the railroads for 15 per cent. increase in freight rates.

May 7-9—Illinois Mining Institute meets at La Salle, Ill.

May 9—Committee on Coal Production holds its first meeting in Washington, D. C.

May 10—Wage agreement between Southwestern Coal Operators' Association and United Mine Workers of America, District No. 14, to become effective as of May 1.

May 17—Southern Wyoming region makes a new wage contract increasing machine- and pick-mining rates 6 to 8c. per ton and regulating day wages.—Federal Trade Commission makes a report on bituminous-coal trade, recognizing the scarcity of fuel and the large demand for coal and opposing enlistment and conscription of mine workers.

May 18—Kentucky Mining Institute meets at Lexington, Ky.

May 24—Mine workers in central Pennsylvania, District No. 2, agree to accept a new wage contract.—Operators in Winding Gulf and New River fields of West Virginia grant to the miners a 12c. increase per gross ton and the weighing of all coal and to all their employees recognition of the union and the eight-hour day.

June 1—New agreement between Washington Coal Operators' Association and United Mine Workers comes into force.

June 2—Mine explosion at Rend No. 2, Herrin, Ill., in which nine men were killed.

June 3—Explosion at mine of Canadian (Dunsmuir) collieries, killing five men of a surveying corps, including George W. Bertram, chief surveyor.

June 4—Meeting in Philadelphia of operators and shippers of bituminous coal to North Atlantic ports for the purpose of pooling coal shipments.

June 5—Registration for draft of men for National Army throughout the United States.

June 5-6—West Virginia Coal Mining Institute meets at Charleston.

June 11—Rules of Tidewater Coal Exchange are formulated.

June 12—Eight Preston County mining companies and one Harrison County mining company join the two Taylor County mining companies in West Virginia that on May 5 signed a scale with the United Mine Workers of America.

June 19—Rocky Mountain Institute holds summer meeting at Glenwood Springs, Colo.

June 20—R. F. Green recommends that a commission be appointed to take charge of the mines in District 18 (Western Canada) and the Dominion Government appoints W. H. Armstrong to that position.—Federal Trade Commission reports to the Senate on anthracite and bituminous coal.—Interstate Commerce Commission refuses to approve 15 per cent. increase of rates filed by the railroads to meet the advanced costs in operation. However, the Eastern roads are granted high-class rates, thus adding nearly 10 per cent. to their gross earnings.

June 22—Canadian Government takes over operation of Crow's Nest Pass coal mines, which a strike had closed.

June 26-28—Conference of coal operators at Washington, D. C., meets and fixes prices.

June 29—Supplemental wage agreement between Kanawha coal operators and United Mine Workers of America.—House passes "Priority Act," giving President right to designate priority shipments in interstate commerce.

July 1—Tidewater Coal Exchange rules go into effect.

July 3—Strike commences in western Kentucky, embracing Hopkins, Union, Webster, Christian and Henderson Counties.

July 7—Senate passes bill to prohibit manufacture and importation of whiskey during the war.

July 9—By proclamation, President Wilson places exports of certain commodities (coal and fuel oil, iron and steel and ammunition, etc.) under control of the Government.

July 11—"Trading with Enemy" act passes the House.

July 18—M. A. Hanna & Co., of Cleveland, Ohio, purchases the anthracite mines of the Pennsylvania R.R. These are the Susquehanna Coal Co. and the Lytle Coal Co.

July 19—Pennsylvania law requiring motor-driven ambulances instead of horse- or mule-driven conveyances for transportation of those injured in the mines is signed by Governor Brumbaugh.

July 20—Draft is made for the National Army.

July 26—Explosion at No. 12 colliery of Dominion Coal Co., near New Waterford, Nova Scotia, in which 65 mine workers are killed.

Aug. 4—Explosion at West Kentucky No. 7 mine of West Kentucky Coal Co., Clay, Ky., in which 62 men lose their lives.

Aug. 11—Strike occurs in southeastern Kentucky and eastern Tennessee.

Aug. 20—Judge Robert S. Lovett, chairman, Union Pacific R.R., is designated as Federal Agent under Priority Act.—Lovett directs 46 railroads to give preference to such shipments from the coal mines as are consigned for the Northwest via the Great Lakes.

Aug. 21—President sets prices for bituminous coal at the mines. Run-of-mine varies from $1.90 to $3.25; prepared sizes from $2.15 to $3.50; slack or screenings from $1.65 to $3 per short ton.

Aug. 22—National Coal Operators' Association formed at Washington.

Aug. 23—President sets prices for anthracite at mines and regulates jobbing charges. Decision leaves price of coal at mines unaffected.—President names Harry A. Garfield as coal administrator under the "Food Control Bill."

Aug. 25—B. N. Baruch, R. S. Lovett and R. S. Brookins appointed a commission to make purchases for the allied nations.—V. E. Macy appointed public's representative on board to arbitrate shipyards' disputes. President names Macy. The Shipping Board and President Gompers, of American Federation of Labor, will also name a member each.

Aug. 27—Alabama dispute comes to an end after six days' conference.

Aug. 31—New wage agreement between Washington coal operators and United Mine Workers is signed.

Sept. 8—Coal transport order goes into effect in Great Britain. This order prevents cross-hauling.

Sept. 10-14—National Safety Council meets in New York.

Sept. 14—John P. White appointed adviser to the United States Fuel Administrator.

Sept. 22—Fuel Administration orders Canadian shipments reported.

Sept. 24—War Industries Board and steel producers agree to reduce price of pig iron, some steel products and coke, effective for four months. Price is $33 for pig iron and $6 for coke.

Sept. 26—National Coal Association is definitely organized.

Sept. 30—Dr. H. A. Garfield cuts anthracite pea-coal prices 60c. and raises price of coal in several parts of Missouri, Iowa, Arkansas, Oklahoma, Colorado, Alabama and Indiana (block-coal district).

Oct. 1—Temporary order cutting off Canadian coal supply in favor of the sections in the Northwest of the United States, which had apparently not received their share in the preference given to the Northwest by Judge Lovett.

Oct. 4—The Exports Administration Board decides to withhold American coal from such neutral (South American) vessels as were trading with European neutrals in goods which would ultimately benefit the enemy.

Oct. 6—Washington agreement is signed by representatives of operators and mine workers of Central Competitive field, whereby it is agreed that wages should be raised if price increases are conceded and that the operators shall pay a penalty if violations of the agreement by the mine workers are not penalized in full accordance with the terms of the agreements binding on them.—"Trading with Enemy Act" is approved.

Oct. 8-13—American Institute of Mining Engineers meets in St. Louis and other Middle West points.

Oct. 11—Four men killed at a haulage accident at the Flat Top mine, Flat Top, Ala.

Oct. 20—Colorado State Industrial Commission reports in favor of Colorado Fuel and Iron Co. in dispute with United Mine Workers of America, and indorses, in particular, the Rockefeller plan.

Oct. 23—An agreement is signed by the Southwestern Interstate Coal Operators' Association and the United Mine Workers of America, covering Missouri, Arkansas and Oklahoma. This was amended Nov. 17 and came into effect as of Nov. 1.

Oct. 27—Priority Order No. 2, relative to open-top cars, is promulgated.—President grants increase of 45c. a ton in price of bituminous coal, but provides that contracts, already made, which base prices on miners' wages, shall be increased as the contracts provide and not in accord with the increase in price set for coal not under contract. The order shall not apply where mine workers refuse to agree to some sort of penalty clause.—Prices are set for the first time in Michigan and are increased in Montana, Arkansas (Paris field),

Illinois (McLean Coal Co. of Bloomington), Missouri (Putnam County and longwall thin seam in Randolph County). In Montana, Arkansas and Illinois, where prices were raised on prepared sizes, they were concurrently lowered on screenings.

Nov. 1—Central Pennsylvania, South Wyoming and Southwestern wage scales come into force.—New safety standards for coal mines inaugurated by The Associated Companies.

Nov. 2—Priority order No. 3 is issued relative to movement of coal from mines in Utah and Wyoming.

Nov. 3—Announcement made that a special mining regiment, known as 27th Engineers, would be raised by voluntary enlistment.

Nov. 6—National Fuel Administrator declares his intention to requisition 10 per cent. of output of every coal mine in United States.

Nov. 7—Agreement at Thurmond, W. Va., between mine workers and operators. Increases granted are the same as in the Washington agreement. The penalty clause is accepted.—Agreement at Great Falls, Mont., between Montana mine workers and operators.

Nov. 8—Anthracite wage conference assembles.

Nov. 9—The Fuel Administration fixes price for blast-furnace coke, foundry coke and crushed coke to become effective Nov. 10.—Ohio wage-scale agreements made at Cleveland, Ohio.

Nov. 10—Connellsville operators grant an increase.

Nov. 12—Three men killed at Gowen mine, No. 40, Gowen, Okla.

Nov. 15—Federal law relating to the use of explosives comes into force.

Nov. 17—Illinois Mining Institute holds its fall meeting.—Order regulating price of byproducts and gas coke to become effective Nov. 19.—Penalty clause satisfactory to mine workers, operators and Fuel Administration is signed in Illinois.

Nov. 22—The Federal Court at Fort Smith awards Franklin Bache triple damages, amounting to $2,222,000, the defendants being the United Mine Workers of America.

Nov. 23—The Fuel Administrator makes regulation regarding new coal mines.

Nov. 25—John P. White resigns as president of the United Mine Workers of America and becomes assistant to Dr. H. A. Garfield, United States Fuel Administrator.

Nov. 26—Penalty clause for Illinois mine workers approved by the Fuel Administrator.

Nov. 29—Emerson Carey makes special ruling for Osage district mines in Kansas.

Nov. 29—Mine explosion at Old Ben No. 11 mine, Christopher, Ill., in which 17 persons lost their lives.

Nov. 30—Priority order No. 1, giving preference to shipment to Northwest, is rescinded.

Dec. 1—Anthracite prices are increased 35c. per ton.

Dec. 5-6—Coal Mining Institute of America holds its winter meeting in Pittsburgh, Penn.

Dec. 7—United States declares war against Austria-Hungary.

Dec. 10—Supreme Court hands down an important decision in favor of petitioner in case of Hitchman Coal and Coke Co. vs. John Mitchell, T. L. Lewis, W. B. Wilson et al.

Dec. 12—Live stock, perishable freight, food and feed are given a priority over coal except coal for railroad use. Supplies to the United States Government have right ahead of coal, also all supplies designated by the officers of the United States Government as immediately needed. Coal for byproduct plants is given priority over all other coal except coal for railroad use.

Dec. 14—Kentucky Mining Institute holds short session at Louisville, Ky.—Federal Trade Commission meets steel operators to discuss coke and steel costs in presence of representative of War Industries Board.

Dec. 17—Mine explosion at Yukon No. 1 mine, Susanna, near Bluefield, W. Va., in which 17 persons lose their lives.

Dec. 20—Mine explosion at Nemo mine, Harriman, Tenn., in which 11 men lose their lives.

Dec. 22—Differential of 6⅜c. established in Kansas in favor of the miner in the thin vein.

Dec. 28—Government operation of railroads established in United States by Presidential proclamation, William G. McAdoo, Secretary of the Treasury, being placed in charge.—President directs that the maximum prices already set on iron ore, coke, pig iron, steel and steel products be continued in effect until Mar. 31, 1918.

Research Fellowships at University of Illinois Experiment Station

To extend and strengthen the field of its graduate work in engineering, the University of Illinois maintains fourteen engineering experiment station research fellowships. One other such fellowship has been established under the patronage of the Illinois Gas Association. These fellowships, for each of which there is an annual stipend of $500, are open to graduates of approved American and foreign universities and technical schools. Appointments to these fellowships are made and must be accepted for two consecutive collegiate years, at the expiration of which period, if all requirements have been met, the degree of Master of Science will be conferred. Not more than half of the time of the Research Fellows is required in connection with the work of the department to which they are assigned, the remainder being available for graduate study.

Nominations to these fellowships, accompanied by assignments to special departments of the Engineering Experiment station, are made from applications received by the Director of the Station each year not later than the first day of February. The nominations are made by the station staff, subject to the approval of the executive faculty of the graduate school and the president of the university. Nominations are based upon the character, scholastic attainments, and promise of success in the principal line of study or research to which the candidate proposes to devote himelf. Preference is given those applicants who have had some practical engineering experience.

The Engineering Experiment Station, an organization within the College of Engineering, was established in 1903 for the purpose of carrying on investigations in the various branches of engineering, and for the study of problems of importance to engineers and to the manufacturing and industrial interests of the state. Research work may be undertaken in architecture, architectural engineering, ceramic engineering, chemistry, civil engineering, electrical engineering, mechanical engineering, mining engineering, municipal and sanitary engineering, physics, railway engineering, and in theoretical and applied mechanics.

The work of the station is closely related to that of the College of Engineering, and the heads of departments in the college constitute the administrative station staff. Investigations are carried on by members of the station staff and other members of the instructional staff of the College of Engineering, by special investigators employed by the station, and by the Research Fellows. Additional information may be obtained by addressing The Director, Engineering Experiment Station, University of Illinois, Urbana, Illinois.

Mining Anthracite in the Pennsylvania Wyoming Region in 1917

By J. H. HAERTTER
Division Superintendent, Lehigh Valley Coal Co., Wilkes-Barre, Penn.

THE year 1917 in the Wyoming region of Pennsylvania was one of unusual activity as compared with previous years when dullness in the trade, particularly during the summer months, necessarily reduced the number of days worked. Conditions which never previously existed in the history of the industry, due to the war, perplexed the minds of the operators and their official organizations, among whom were men of long and wide experience. A greater production was demanded in face of a 20 per cent. labor shortage, a shorter working day, a scarcity of railroad cars and the difficulty and delay experienced in procuring material and machinery.

The production of the region for the year—about 55 per cent. of total anthracite production—will be approximately 49,500,000 tons, the rail shipments, estimated at 43,000,000 tons, being greater than the total production in former years, which included local retail trade and coal consumed in colliery operations. A further increase was prevented by a number of petty strikes, lack of railroad cars and the usual observance of a number of holy days.

Many Banks Reclaimed During Year

The tonnage figures for the year, when available, will show unusual activity in the reclaiming of banks; a great number of steam shovels were used for the loading of the material from these banks and washeries were erected for preparing the product for market. Where the banks were not of sufficient size to warrant the erection of a washery, the material was loaded into mine and railroad cars and transported to the breakers for preparation along with the run-of-mine coal. In some localities dump wagons were used for haulage. By these latter methods numerous small banks in isolated locations, and heretofore considered unprofitable from a transportation standpoint, were reclaimed to meet the heavy demand for steam sizes. In fact so heavy was the demand at times for these sizes that the consumer asked for immediate shipment of the material as it was loaded from the bank. River dredging for the smaller sizes during favorable weather was also conducted on a larger scale than ever before, and the output, though small and not included in the production, relieved the situation to the extent that fuel used locally permitted shipments from the mines to out-of-town points.

Important as affecting the results for 1917 was the extent to which the use of coal-cutting machinery has developed during the past several years. This was notably true in the Scranton district, where the exhaustion of the thick and profitable beds made the installation of machinery for profitable mining and the maintenance of output compulsory. The mining of these low beds by machines, undertaken several years ago, during which time the best efficiency in their operation and the various methods of mining could be worked out, is a condition now to be appreciated by those operators who, confronted by a scarcity of miners and laborers, are able with these machines to maintain their production.

Of greater importance to the increased production was the increased number of air drills of the Jackhamer type which were put into use during 1917. Like the coal-cutting machines, and fortunately too, their practicability and efficiency had been fully demonstrated, due, as stated before, to a shortage of men as a result of the exodus to other industries and the large virgin territory of low coal from which the tonnage must be obtained. These drills, which were first introduced for drilling the rock for height in the low beds, are now used extensively for drilling the coal.

Several of the large coal companies now carry the drills in stock for the convenience of the miners, who are allowed to purchase them on the installment plan at a small amount per month. Another method in vogue in the low beds where the mine car follows, is to employ competent company men, experienced in rock work, to drill, fire and gob or load the rock on the night shift. In this way the miner is kept constantly on coal during the entire time he is in his chamber. Gangways, too, are driven ahead more rapidly, and territory for chambers is therefore also developed more rapidly. That a greater production will come from the same number of working places is readily appreciated. This method, owing to labor shortage and manifested discontent among miners because of the shortage, was introduced during the year and materially benefited production.

Many Electric Locomotives Installed

Electrification of haulage roads was continued during the year on a large scale. Perhaps the demand for no other class of material was so great as that for electrical equipment. Only the inability of the manufacturers of electric locomotives to make deliveries in the usual time prevented what would have probably been the banner year in motor installation, in spite of the fact that the price over former years had almost trebled. A great number of electric locomotives, however, were installed and they, together with the number of storage-battery locomotives which came into extensive use during the year because of the scarcity of material for the usual line extensions, played an important part in the production, particularly where a scarcity of mules and drivers would have had a serious effect.

During the year, haulage at several operations in the Scranton district was almost entirely converted from mule to electric. At these same operations, mining also was almost entirely done by machines, either coal-cutters or air drills, the air for which was furnished by small electrically driven air compressors, mounted on

narrow-gage mine trucks for transportation to and from the working places. The gigantic electrification of these operations undertaken primarily several years ago for the profitable mining of low beds has played no small part in the production of anthracite in 1917.

Perhaps one of the most prominent features in anthracite operations for the year was the stage which all the companies had reached in concentration, pumping, transportation, preparation and, in many localities, power. At no time has the wisdom of this movement, begun several years ago, been so forcibly appreciated. In fact should the war continue for any great length of time, and should there be an additional drain on the labor forces, further and hurried concentration will undoubtedly result.

Summed up, therefore, the increase in annual production was due to the steady time worked as compared with former years, the reclaiming of banks and, to a large extent, the increased use of machinery.

A large amount of credit must be given, nevertheless, to company and union officials, miners, company men and boys, who, immediately upon the declaration of war, roused to patriotism, have labored perhaps as never before to give to their country and fellowmen the coal needed to help win the conflict. Surely the year 1917 will go down in anthracite history. We can make the year 1918 bigger and better. Let us begin at once to do it. Many miners have worked extra time in spite of the fact they had to load the coal formerly loaded by the laborer after the miner had drilled his holes and fired them. The majority of officials, foremen and clerks sacrificed the usual summer vacations in order to produce a larger tonnage.

Safety Banquet at Gary, W. Va.

The eighth safety-boosting banquet of the United States Coal and Coke Co. was held in Gary, W. Va., Saturday evening, Jan. 12, 1918. Ever since 1909 it has been the custom of this company to give a banquet each year to the superintendents, assistant superintendents, foremen, subforemen, bosses, etc., upon whom devolves the work of keeping the mines safe. Guests, friends and former employees of the company are also invited to these affairs.

In the present instance the various speakers laid about as much emphasis upon the need of maximum production as upon maximum safety. All were made to realize that the country is at war and that a high rate of production per man is necessary in order to insure the successful prosecution and prompt winning of the struggle.

The room where the banquet was held was tastily decorated for the occasion, chiefly with the flags of this country and its Allies. An orchestra behind a screen of evergreens furnished music during the evening, opening the program with the "Star Spangled Banner."

General Edward O'Toole presided as toastmaster. Wall charts showing the progress the company had made in accident prevention were explained by H. N. Eavenson, chief engineer. Although these diagrams indicated that a steady advance had been made, the management is not satisfied with the results so far attained; and it is believed that a still better showing can be made.

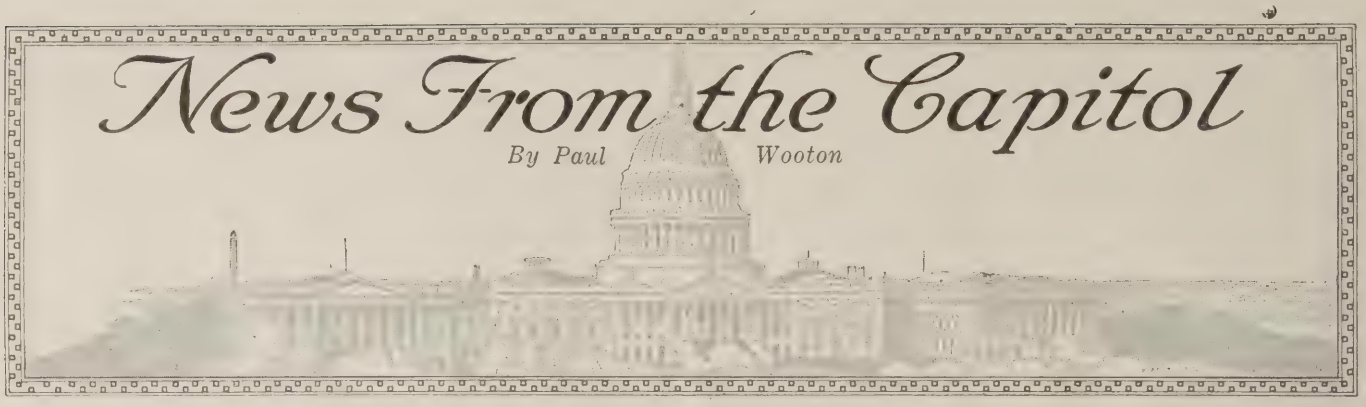
Among the speakers were H. I. Shott, editor of the *Bluefield Daily Telegraph;* L. C. Anderson, of Welch, W. Va.; H. C. Ogden, editor of the *Wheeling Intelligencer;* the Rev. Father Madert; the Rev. Mr. Benton and General O'Toole.

At the close of the evening the audience rose and was dismissed with a fervent prayer for the Nation, its armies and its people.

Illinois Mining Commission Visits Pittsburgh District

A commission appointed by Governor Frank O. Lowden, of Illinois, has been investigating the mines in the Pittsburgh field with the purpose of collecting data on the safety provisions being taken therein. The members of this commission are: Evan John, director, Illinois Department of Mines, Springfield, Ill.; William Hutton, miners' representative, State Mining Board, Springfield, Ill.; Robert M. Medill, general superintendent, O'Gara Coal Co., Harrisburg, Ill.; M. S. Coleman, general superintendent, Saline County Coal Co., Harrisburg, Illinois.

During its trip this commission visited Banning No. 2 mine, of the Pittsburgh Coal Co.; Marianna mine, of the Union Coal and Coke Co.; the Experimental Mine, at Bruceton, of the United States Bureau of Mines, and Vesta No. 4 mine, of the Vesta Coal Co. The commission will continue its investigations at other operations throughout the Pittsburgh field as well as in adjoining districts. James E. Anderson, chief field inspector of the Associated Companies, through the courtesy of H. M. Wilson, the director of its operations, piloted the visitors through the mines. Director Evan John expressed himself in an interview much interested in what he had seen and complimented the Pittsburgh district on what it had done to bring its safety provisions up to date.



For Use in Estimating Concrete

For the following figures we are indebted to "The Ransome Book" on "How To Make and How To Use Concrete." Roughly speaking, a sack of cement occupies a cubic foot, so the mixture and material columns are the same.

Mixtures		Materials			Aggregate		
Cement	Sand	Pebbles or Stone	Cement, Sacks	Sand, Cu.Ft.	Pebbles or Stone, Cu.Ft.	Mortar, Cu.Ft.	Concrete, Cu.Ft.
1	1½	..	1	1½	..	1 75	....
1	2	..	1	2	..	2 10	....
1	3	..	1	3		2 80	....
1	1½	3	1	1½	3	....	3 50
1	2	3	1	2	3		3 90
1	2	4	1	2	4		4 50
1	2½	4	1	2½	4		4 80
1	2½	5	1	2½	5		5 40
1	3	5	1	3	5		5 80

The table following gives the quantities per cubic yard of compacted concrete of the mixtures specified:

Mixtures		Materials			
Cement	Sand	Pebbles or Stone	Cement, Sacks	Sand, Cu.Ft.	Pebbles or Stone, Cu.Ft.
1	1½	..	15.5	23.2	....
1	2	..	12.8	25.6	....
1	3	..	9.6	28.8	....
1	1½	3	7.6	11.4	22.8
1	2	3	7.0	14.0	21.0
1	2	4	6.0	12.0	24.0
1	2½	4	5.6	14.0	22.4
1	2½	5	5.0	12.5	25.0
1	3	5	4.6	13.8	23.0
1	3	6	4.2	12.6	25.2

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Metropolitan Bank Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 703, Metropolitan Bank Building, Washington, D. C., while at the capital.—Editor.]

Garfield Defends Order That Shut Down Industries

Washington had no advance notice of the order prescribing coalless days. In fact every effort apparently was made to keep the real nature of the order a secret. Many members of the Fuel Administration's staff were taken completely by surprise when the formal announcement was made. On the day the order was issued, a rumor reached the correspondent of *Coal Age* that curtailment of certain nonessential industries was in contemplation. Inquiry at the Fuel Administration, however, brought forth a statement that the report doubtless came from an effort that was being made to determine a temporary curtailment in New York City until deliveries could be made more rapidly from Jersey terminals. The announcement that the coalless days were to be put into effect was issued at 10 p.m., Jan. 16.

The plan is thought by many to have originated outside of the Fuel Administration. Owing to the fact that the order is so apparently a railroad relief measure, some think that it was conceived by friends of the Administration who saw in it an opportunity to allow the criticism to fall on Dr. Garfield while the one to benefit most would be the Director General of Railroads. Any such version is denied vigorously at the Fuel Administration, where it is said that Dr. Garfield has had the plan in mind for many weeks but was hoping against hope that the situation would better itself without such drastic action. P. B. Noyes, the head of the conservation division of the Fuel Administration, is recognized as having been an important factor in securing the issuance of the order at this time. He had been investigating fuel conditions in New York and in Boston and became convinced that a general shutdown would be necessary before the situation could be brought well into hand. The actual drafting of the order was done by H. D. Nims.

Following the publication of the order, the Senate of the United States allowed itself to reach a degree of excitement that has few precedents. The political side of the situation received a thorough airing on the floor of the Senate and only 19 votes were cast against a resolution introduced by Senator Hitchcock requesting a five-day suspension of the order to allow those opposing it to be heard. The passage of a day or two, however, brought into plainer view the practical side of the order.

At first there were few who would admit that the order has a practical side, but it was not long before the voices of the friends of the Fuel Administration could be heard. They declared that there is nothing quixotic about the order, but that it is a business proposition to which many far-seeing business men had subscribed prior to its promulgation. They pointed out that mines are in no way interfered with and that there is no interference in the normal course of coal traffic until the cars reach destination, when distribution is superintended so as to allow the building up of slight reserves on the part of the consumers in whose hands it is most necessary to have an adequate supply of coal.

It was also pointed out that care was taken to protect coke ovens, food industries and others which naturally were entitled to exemption. Just as in the case of the selective service act, every effort was made to make it apply equally to all similarly situated. One prominent manufacturer was quoted by the friends of the Fuel Administration as declaring the five-day shutdown as the best possible step that could be taken to benefit the manufacturer, even if no consideration is taken of the good to be derived from clearing up the transportation situation. This manufacturer is said to hold the opinion that there is not a plant in the United States that will not profit as a result of the shutdown. It will give them a chance, he says, to oil up, overhaul and get into shape to continue operation under high pressure.

Most of the coal operators, judging from the opinions expressed in their communications to Washington and from the verbal expression of those in the capital, regard the order as primarily a railroad relief measure. Many of them think that Dr. Garfield unwittingly is pulling Mr. McAdoo's chestnuts out of the fire. They admit that manufacturing plants were speeded too high for the railroads, but they believe the situation should have been remedied by a direct order from Mr. McAdoo, who, they declare, could have met the situation simply by keeping new traffic off the rails and by requiring more prompt unloading of equipment and more efficiency in the return of empty cars. The opinion is expressed

that Mr. McAdoo will be beset by criticism if he does not succeed in eliminating congestion after the Fuel Administrator has shut up the country for five days. After this, many think there will be no excuse for a condition which permitted 45 miles of anthracite trains to be stalled and which caused great coal-producing districts, such as the Kanawha field, to be impotent in relieving the coal shortage by receiving 7400 cars when 59,000 were urgently needed.

It is admitted that, had Dr. Garfield's arguments for his order been presented a day or two before its issuance, the storm of disapproval would have been less severe. As it was, Dr. Garfield's defense of the order was not issued until Jan. 18. This defense is regarded very generally here as being a very able one. It reads as follows in its entirety:

The most urgent thing to be done is to send to the American forces abroad and to the Allies the food and war supplies which they vitally need. War munitions, food, manufactured articles of every description, lie at our Atlantic ports in tens of thousands of tons, while literally hundreds of ships, waiting loaded with war goods for our men and the Allies, cannot take the seas because their bunkers are empty of coal. The coal to send them on their way is waiting behind the congested freight that has jammed all terminals.

It is worse than useless to bend our energies to more manufacturing when what we have already manufactured lies at tidewater congesting terminal facilities, jamming the railroad yards and sidetracks for long distances back into the country. No power on earth can move this freight into the war zone where it is needed until we supply the ships with fuel.

Once the docks are cleared of the valuable freight for which our men and associates in the war now wait in vain, then again our energies and power may be turned to manufacturing, more efficient than ever, so that a steady and uninterrupted stream of vital supplies may be this Nation's answer to the Allies' cry for help.

It has been excess of production, in our war-time speeding up, that has done so much to cause congestion on our railroads; that has filled the freight yards to overflowing; that has cluttered the docks of our Atlantic ports with goods waiting to go abroad. At tidewater the flood of freight has stopped. The ships were unable to complete the journey from our factories to the war depots behind the firing line.

Added to this has been the difficulty of transporting coal for our own domestic needs. On top of these difficulties has come one of the most terribly severe winters we have known in years.

The wheels were choked and stopped; zero weather and snowbound trains; terminals congested; harbors with shipping frozen in; rivers and canals impassable—it was useless to continue manufacture and pile confusion on top of confusion. A clear line from the manufacturing establishments to the seaboard and beyond; that was the imperative need. It was like soldiers marching to the front. The men in the foremost ranks must have room to move.

More than a shock was needed to make a way through that congestion at the terminals and on the docks so that the aid so vitally needed by the Allies could get through.

The incidental effect of this transportation situation on coal production has been disastrous. There is and always has been plenty of fuel, but it cannot be moved to those places where it is so badly needed while railroad lines and terminals are choked. Throughout the coal fields scores, even hundreds, of mines are lying idle because of railroad inability to supply the cars to carry away their product. Coal mines cannot operate without cars. Cars cannot be supplied while the railroads are crippled by the present freight congestion; which keeps idle cars lying useless in the freight yards.

In the past week the production of coal has been disastrously reduced. Reports in some cases have shown 90 per cent. of the mines in certain fields closed completely.

This is war! Whatever the cost we must pay it so that in the face of the enemy there can never be the reproach that we held back from doing our full share. Those ships laden with our supplies of food for men and food for guns must have coal and put to sea.

Baltimore & Ohio Does Not Have To Furnish Cars to Wagon Mines

Refusal, under certain conditions, of the Baltimore & Ohio R.R. to supply coal cars for the use of wagon mines is upheld in a tentative report made public Monday, Jan. 21, by the Interstate Commerce Commission. Since July 24, 1917, the Baltimore & Ohio has refused to supply wagon mines with open-top cars for loading and shipping of coal from its public team tracks. The railroad continues to supply such equipment to mines equipped with tipples, and to wagon mines where the loading is accomplished on private or industrial tracks. Box cars only are furnished for team-track loading. The commission holds that: "Although in its nature a discrimination as between shippers as a class, this practice is shown to operate in the interests of the public as a whole; and in the light of such results it is neither an unjust discrimination nor is it unduly prejudicial within the meaning of Sec. 3 of the regulating statute."

Peabody Suggests Price Changes

Testifying before the Senate Investigating Committee, Jan. 17, Francis S. Peabody made the following suggestions with regard to price:

All coal from seams 36 in. and under, $4; from seams 36 to 48 in., $3.50; from seams 48 in. to 5 ft., $3; from seams, 5 ft. to 6 ft., $2.50. All the prices mentioned are for mine-run.

Mr. Peabody specified that the Bureau of Mines is to establish the practical commercial ash content in all fields, this finding to be used as a standard. Coal, with ash exceeding the standard, is to be penalized $1 a ton. A premium of 10c. a ton is to be allowed on prepared sizes. An addition of 20c. per ton is to be allowed for coal that is picked over the picking table. Coal handled through washers or spiralizers would be allowed a premium of 30c. a ton.

The zoning plan proposed by Mr. Peabody and an analysis of the law governing the sale of coal in England were embodied in the record of the committee in connection with Mr. Peabody's testimony.

Weekly Production Statistics

Weather conditions are blamed largely for a decided decrease in the average daily production of bituminous coal for the week ended Jan. 12. The average daily production was 1,735,023 tons, making the week's production 10,410,140 tons. Beehive coke, to the amount of 586,628 tons, was produced for the week ended Jan. 12, which shows a decided improvement over the preceding week. Anthracite shipments for the week under review were 35,720 cars, which still is considerably under the average. These figures are compiled from the returns to the United States Geological Survey.

An analysis of production during the week ended Jan. 5 shows that the percentage of full-time output was 74.

This compares with 75.4 per cent. for the week preceding. C. E. Lesher, the geologist in charge of coal statistics at the Geological Survey, makes the following comment on conditions during the week of Jan. 5:

Throughout the United States the ratio of tonnage produced to full-time capacity amounted to 74 per cent. during the week ended Jan. 5. Although approximately the same proportion of the potential capacity was lost during the week of New Year's as during Christmas week, there was a change in the relative importance of the causes of loss. Losses due to labor declined from 10.1 per cent. during Christmas week to 3.1 per cent. during the week of New Year, while at the same time losses attributed to shortage of cars increased from 9.4 to 17 per cent.

Improved working conditions were reported from Illinois, Indiana, central Pennsylvania, the Winding Gulf and Panhandle districts of West Virginia; from the Cumberland-Piedmont field, western Kentucky, and the entire region of the South and West, from Virginia and Alabama to Kansas and Missouri, and the Rocky Mountain States. Unfavorable conditions were reported from Ohio, western Pennsylvania, Somerset County, Pennsylvania, northeastern Kentucky, and in the high-volatile, Junior Philippi, and Fairmont districts of West Virginia. In each of these fields the decline in production was attributed to a lack of cars more acute than that experienced during the week before.

The total capacity of the country's byproduct coke plants is approximately 500,000 tons per week. During the week ended Jan. 5, operation was at 81.1 per cent. of full-time capacity. The chief limiting factor was the inability of operators to secure coal.

State Fuel Administrators Given Power To Divert Coal or Coke

Formal authority to divert coal or coke to meet the emergency demands of domestic consumers was conferred on State Administrators in a regulation promulgated on Jan. 14 by the United States Fuel Administrator, Harry A. Garfield. State Administrators were authorized to make diversions to relieve distress in a telegram sent by the U. S. Fuel Administrator on Dec. 31. The order promulgated on Jan. 14 confirms that authority. It provides:

Whenever the state fuel administrator in any state is of opinion that, in the present exigency occasioned by the war in which the United States is now engaged, the consumers in any city, town or other locality in such state are in pressing need of coal or coke for domestic use, whether by reason of a general shortage of coal or coke therein or of an unequal distribution among the residents thereof, and that there is actual or threatened inconvenience and suffering of the population therein, or that any public utility in such state conducting a service essential to the health, convenience or industrial activity of any of the people of such state, is in danger of discontinuance for lack of coal or coke, so that in either case the efficiency and ability of the people of such state, or any part thereof, for performing their part in the conduct of the war may be lessened or impaired, such state fuel administrator may take the action hereinafter indicated.

He may divert to or for the use of such domestic consumers, or to or for the use of any such public utility, any coal or coke in transit by railroad or other conveyance within such state and consigned or intended for delivery to any consumer, dealer or other party therein for consumption, sale or use in such state. Such diversions shall be made in accordance with the lawfully published tariffs and reasonable regulations of the railroads now under control of the United States Director General of Railroads. As soon as practical after diversion the state fuel administrator shall cause notice to be sent both to the shipper and to the consignee of the coal or coke so diverted; and the shipper thereof will be expected, so far and as soon as practical, to replace for such consignee an equal amount of coal or coke of the same grade and quality as that diverted.

As a supplement to this regulation, the Fuel Administrator on Jan. 15 directed that all shipments diverted under the authority conferred in the regulation should be made at the Government prices for the coal or coke. Under the regulation, all coal, whether it has been sold and shipped or not, shall be subject to diversion at the Government prices. The shipper of diverted coal will, however, be allowed to collect a charge of 15c. per ton to cover handling, provided no jobbers' commission is added to the price.

The regulation of Jan. 15 on this point reads:

All shipments of coal, whether f.o.b. mines or otherwise, and all shipments of coke f.o.b. ovens or at place of storage or otherwise, shall be made subject to the diversion of such coal or coke by the United States Fuel Administrator or any persons acting under his authority, to any persons or consumers, and for any of the purposes heretofore or hereafter authorized by him. The title of the purchaser, consignee or consumer, in the case of any such shipments of coal or coke, which by custom or law might become vested at the time and place of such shipment, shall from and after the effective date hereof be subject to the condition that the coal or coke so shipped may be diverted as aforesaid, and that in case of any such diversion, the title and interest of such purchaser, consignee or consumer with respect to any coal or coke so diverted shall be completely divested and terminated and his liability to pay therefor shall cease. The person or consumer to whom any such coal or coke is diverted shall become liable as of the time of such diversion to pay to the shipper thereof the price in force at the date of shipment as fixed therefor by or under authority of the President of the United States, plus transportation charges thereon and plus a handling charge of 15c. a net ton to cover costs of rebuilding, collection and replacement. If such handling charge is made no jobber's commission shall be added to the mine's price. If the coal or coke so diverted was shipped under a valid and enforcible contract the quantity thereof so diverted shall not be charged against the amount to which the contract applied.

Effective at 7 a.m., on Jan. 15, 1918.

(Signed) H. A. GARFIELD,
United States Fuel Administrator.

Brief Washington Notes

At the request of the Fuel Administrator, the Director General of the Railroads placed an embargo on open-top cars suitable for coal loading, so as to reserve this class of equipment exclusively for the handling of coal.

Both the Shipping Board and the Fuel Administration have sent representatives to New York to assist A. H. Smith, the Director General of Railroads, in making arangements looking to the pooling of facilities for bunkering ships in New York harbor.

East St. Louis has the reputation of being able to make itself heard. This was fully borne out by the manner in which the Illinois city protested against the Fuel Administrator's order, which closed its industries and allowed those of St. Louis to continue operation uninterruptedly. East St. Louis interests were anxious to have themselves included with St. Louis in being exempt from the order. The protest nearly resulted, it is said, in the inclusion of St. Louis in the territory.

THE LABOR SITUATION

General Labor Review

A splendid spirit animates the mine workers at their biennial convention. In the face of great national needs almost every mine leader has become a patriot. The one or two who have not risen to the occasion have been a thorn in the flesh of the union for years and are a festering sore today. It is just to say they are few and unpopular.

Central Illinois and the Southwestern coal field seem full of disturbing elements. The union cannot overlook these men. It would be best to appoint a body of spellbinders to bring these men to a better mind. No work could do more to redound to the credit of the union.

Leaving Everything Up to the Mine Operator

The mine workers near Shamokin want to use the strike as a club to bring the street-car companies to time. The operator is being made "the goat" for all the mine workers' troubles. After a while the men at the "Millennium Colliery" will quit work to make Maria put pumpkin pie in her husband's pail and make Billy carry in a pail of coal. An editorial in the present issue gives further consideration to this question. The central Illinois miners are asking to ride free to work, the operator to pay the bill. Is it not a fact that the miners have a contract, twice revised, already? Does the Ways and Means Committee believe that a new contract should be written every month?

Mine Workers Supporting Chicago Lawbreakers

One of the mine workers' locals, near Harrisburg, Ill., is alleged to have levied an improper assessment which was to be used in defense of some Industrial Workers of the World, who are under arrest in Chicago. Most of the members in the local refused to pay the assessment and an investigation is now being made.

A strike of 250 miners in the employ of the Durham Coal and Iron Co., at Pittsburg, Ga., recently took place and lasted a week, when a compromise was effected. The men demanded an increase of 20 per cent. on the present price, which is 85c. per ton. Details of the settlement are not available.

Miners Decide That Penalty Clause Is Reasonable

Strange to say, the penalty clause created no trouble at the meeting of the international convention and no oratory was needed to stay the discontent, for help came from a totally unexpected source. Peter McKesky, classed as a radical of radicals, formerly an anthracite miner but now in the bituminous fields of western Pennsylvania, rose and said: "The penalty clause is all right and I am going to stand for the agreement." Peter, during his short stay in the Pittsburgh region, has made himself quite objectionable to the Fuel Administration. He was arrested for staging an illegal strike and for his offense was lodged in jail. But it is all over now. He made his confession of error and took the convention by storm.

Anthracite Men Keep Hands Off Soft Coal

The anthracite mine workers do not want their bituminous fellows to interfere in their business and showed their restraint by not discussing the penalty clause, which has no application to the anthracite region. District officials from Ohio, Illinois, western Kentucky and Tennessee and fully 20 delegates indorsed the agreement. The opposition completely faded away. The officials declared that if the penalty clause was deleted the whole contract would be erased with it. One part was as binding as the other. The clauses stand and fall together. It is finally decided that the foreign language section in the United Mine Workers' Journal is to be maintained.

United Mine Workers' Convention

The convention of the United Mine Workers is justifying the good will of those who have always hoped for the best from the union. Those who have declared that the United Mine Workers were United States citizens and bound in the long run to act as patriots and hard-headed sensible men, who could be trusted with a degree of confidence, have reason not to be ashamed.

In fact, the men of whom we have most to be afraid are those who are outside the industry and who interfere without knowledge. We have the best of men at Washington, but as they are out of touch with things as they are, their judgments fill us with apprehension. Eventually, perhaps, when they come from the Land of Dreams to the Country of Things That Are, we may get better Government and important results.

Have No Time for Blackguarding Operators

But when the miners talk of coal, they speak of something of which they are sure, and that their fingers have handled. They don't waste time blackguarding the operators, for they know that whatever their faults may be—and like everyone else they are not perfect—they are trying to do their best to produce coal as fast as the railroads will let them.

There is no class in coal mining except the coal-industry class. Given a chance, the coal men, from operator to miner, will produce coal to their utmost ability at least so long as the war lasts. Witness the comment of Frank J. Hayes, president of the United Mine Workers: "It is too bad that the American people are suffering the hardships of a coal famine when they have an inexhaustible supply of coal almost at their doors. Had the miners been provided with an adequate car supply during the past year the coal market would have been glutted and not an industry nor a domestic consumer could have suffered from the deplorable condition that now exists.

"Make Every Sacrifice To Boost Production"

"As president of the United Mine Workers of America I have repeatedly urged our membership of 450,000 to make every possible sacrifice to boost production, realizing that congested railroad transportation would eventually result in the shortage with which we are confronted today. In no branch of industry do employees brave greater dangers or make larger sacrifices than in coal mining.

"It is my hope that something can be done to eliminate the widespread suffering threatened and, to that end, I again ask the coöperation of every mine worker, requesting you, one and all, to do your best to produce a maximum output day by day. In many localities miners are practically working only half time. They have been discouraged somewhat by car shortages, but I am sure they will bend every effort when cars are available 'to do their bit big.'"

Miners Not To Blame for Recent Shutdown

Ex-president J. P. White said: "It is to be regretted that the car shortage makes necessary the Federal Fuel Administrator's orders restricting manufacturing and business. Our sympathy goes out to the wage earners who will keenly feel the effects of this step.

"The miners are fortunate that this action can in no way be attributed to them, for they have responded loyally and coöperated to their utmost in attempts to supply the needs of the Government and the people. The situation is to be attributed to inadequate car supply. The miners now, as in the past, will be found ready and willing to do their part loyally and to produce the coal needed by the nation.

"The stern realities of the situation are brought home to every citizen. The hour of sacrifice is here and will and must be met. With the most abundant facilities for producing fuel, we find the activities of the miners reduced and the mines idle only because our transportation facilities are wholly inadequate to meet national necessities."

When the resolution urging the Federal investigators be given complete power to interpret contracts existing between mine workers and operators was introduced, it found much opposition. The mine workers, as also the operators, do not feel great confidence in fuel administrators. These disinterested but untrained officials do not understand mining conditions and would be likely to make unfortunate decisions and to be somewhat slow in making them.

Do Not Want Federal Arbitration of Disputes

Several of the speakers declared at the convention that appointing such arbitrators would be a serious blunder. It would only complicate mine labor troubles. However, we are not disposed to believe that there are labor troubles in prospect. The mine workers ar showing an excellent spirit, and the disposition to do right and take a generous view of matters is growing steadily. The operators are similarly being drawn in sympathy and interest to the side of their men. Many occasions for bitterness in the past are now entirely unlikely to make trouble.

The proposal to give such powers to Federal investigators was contained in a resolution which sought to provide a means by which the operators' accusations that the mine workers were deliberate slackers might be refuted. The resolution brought the first real fight of the convention. The creation of a Federal commission was suggested, composed of an equal number of employers and employees, whose duty it would be to investigate charges made by both parties to the wage contract.

Afraid It Might End in Labor Conscription

White, Hayes, Green, Walker and the committee men before whom the resolution was considered declared that such a step would possibly invite the conscription of labor. White and Hayes denied that the charges occasionally made by a few operators were given credence at Washington. He assured the author of the resolution that the Government knew of the truth or falsity of the reports charging miners in various localities with slacking.

Of course there are slackers among the mine workers. There is no need for a commission, for it could only determine what we well know, that you can't expect to find 450,000 men with a single purpose. It is not to be expected that all the locals will be found free of pro-Germanism and Bolshevikism. But as a body the union needs no defender. It is the duty of the union, as it will be its pleasure, to bring these wilful men to a better mind.

Let the union cease to try to defend itself. It can only fall into public disesteem by so doing. It will be obliged to admit, after an investigation has been made, that some men have been unpatriotic. That is an unfortunate admission for anybody to have to make.

To Answer Union Critics by Deeds, Not Words

Instead of arriving at such a result, how much better to obtain by enthusiastic work a good reputation such as will come from activity in ridding the union of such slackers and from coercion used against men who are seeking excuses rather than opportunities for service. What we want to know is not how few slackers there are in the union, but how numerous are the boosters and patriots; not how many commandments have been broken, but how much good has been done.

That the present shortage of labor is a "bugaboo," and that women should not be permitted to take the place of men in laborious tasks, was decided by the convention in a resolution asking that the Department of Labor investigate the alleged labor shortage and the replacing of men with women in positions requiring heavy toil.

Thomas Kennedy declared the lengthening of the working day in the anthracite region would not increase production, but on the contrary would disorganize the present efficient force, as mine material was hard to obtain. International officials were instructed to conduct an educational campaign for coöperative stores throughout the jurisdiction of the United Mine Workers.

Food Administrator Hoover will be asked to require the operators to notify miners every day whether the mine will operate on the day following. The miners waste the lunches which they bring to work whenever the mine does not operate, so the prior notice, if procurable from the Government operated railroad, will act as a food-conservation measure. Canadian delegates assert that hundreds of Chinese are being brought to Canada on their way to France and are being detained there. A campaign is to be started at once to secure for the new district in West Virginia—No. 29—10,000 new members.

Mother Jones, who was one of the orators, advised against political fights within the organization, and supported Wilson and Hayes. She also advocated the organization of the Pocahontas field.

Union Statistician's Report Is Extremely Interesting

The report of John L. Lewis, vice president and, till recently, statistician of the organization and business manager of the *United Mine Workers' Journal*, contains many items of interest. Among Mr. Lewis' interesting statements stood out prominently the following: "Since and beginning with the year 1912 the United Mine Workers have secured wage advances from 30 to 104 per cent., varying according to the kind of labor performed."

Mr. Lewis went on to speak of these increases as if they were actual advances. He did not actually declare the increase in wages outran the increases in the cost of living or outran the advances in other crafts, but he suggested as much when he said: "Our union has been successful in securing wages that rightfully place the earning power of the mine workers on a par with the [workers belonging to] other stable unions comprising the American labor movement." Clearly then in the mind of Mr. Lewis the wage increases granted represent a revision of the social status of the mine workers and not merely, as has been claimed, a revision of wage rates to accord with rising costs of living.

Lewis Defends Appeal for Increased Wages

He then considers the action of the union in asking for new wage scales during the life of a contract. "It is argued by some [from the context it appears he means members of other international trade unions—Editor] that the opening of a wage agreement and the increasing of wages during the life of a contract is a policy fraught with great danger. They reason that if an agreement can be opened to secure an increase that the precedent thereby established is in reality an invitation to the coal operators to demand a lowering of the wage schedules in periods of depression in the coal industry. I am firmly convinced that such opinions are mistaken. If we maintain our strong union in the future as in the past (and I am convinced we will) and continue to prosecute strong organizing campaigns in the unorganized coal fields, I feel sure there is no power strong enough to dislodge our institution from the achievements we have won or to compel our members to labor under conditions which are worse than those of the present time."

Union Wage Pawl Works Only in One Direction

In short, trade unionism is like a pawl on the wage-rate ratchet. It will permit the wage rate to work only one way, so long as it is not thrown out of gear altogether. On the whole, Mr. Lewis does not miss the truth very much. No one expects, and few even wish, to deprive the mine worker of his increased wage and improved social status, some of which is unfortunately negatived by the uncertainty of his working opportunity.

It may be noted also that here, as also later, in his speech Mr. Lewis shows himself in accord with his chief Frank J. Hayes, and his former chief, John P. White, in regard to the advantage and moral rectitude of trying to extend the domain of the union during the war. His words clearly show that when he says, "If we . . . con-

tinue to prosecute strong organizing campaigns in the unorganized coal fields, I feel there is no power strong enough to dislodge our institution."

Does Mr. Lewis' statistical statement open with a wage report, a membership report or with a report of idle time? Not at all, but with a map showing the number of men who have volunteered and been drafted. The United Mine Workers are solidly behind the war for democracy and solidly behind the draft. Says the report with due reason: "The United Mine Workers has just cause to feel proud of the unbounded patriotism proved by the enlistment of 19,135 members in the nation's service and 60,604 subject to draft." Then follows a statement which we quote, but without indorsement: "The largest number of men in the service of any organization or industry is our proud boast." It is hard to believe that the mine workers can outstrip the farmers of America in an aggregate count of conscripts and volunteers.

Mine Transportation Forces Are Inadequate

However, the statistician goes on to say: "From the reports received from 544 locals, the transportation system seems to have been the only branch of mine service in which a shortage of men could be claimed, and such claims were limited to a comparatively few localities. In many localities reports indicated crowded conditions in the mines, notwithstanding a liberal response to the Government's call for men."

The table shows the number of members, the number who have probably volunteered and been drafted and the number probably subject to draft:

State	Number of Members	Volunteers and Draftees	Subject to Draft
Pennsylvania	145,423	8,302	23,537
Illinois	87,189	3,269	13,863
Ohio	40,553	1,561	7,129
Indiana	24,649	788	3,471
West Virginia	18,510	1,036	3,527
Arkansas, Oklahoma and Texas	14,632	576	2,086
Iowa	13,288	460	671
Tennessee and Eastern Kentucky	12,322	702	1,910
Kansas	9,231	392	1,707
Missouri	7,945	373	636
Wyoming	6,949	360	1,431
Alabama	5,885	253	1,083
Washington	5,591	269	985
Colorado and New Mexico	5,213	328	608
Western Kentucky	4,446	104	742
Montana	3,971	176	664
Maryland	2,512	152	232
Michigan	2,005	34	322
	410,314	19,135	64,604

As stated, the table is based on reports from 544 locals, the percentages obtained in any one state from the locals reporting being used to determine the number of men volunteering and drafted or subject to draft in the other unions of the same state. About 4.82 men out of every 100, in the unions reporting, volunteered or were drafted. About 17.62 men out of every hundred, in the unions reporting, are subject to draft.

Miners Have About 33,000 Drafted Men Already

As a footnote Mr. Lewis says: "If the draft has operated throughout the coal industry in union and nonunion fields in the same degree, the number of the volunteered and the drafted men will reach 33,525. The number subject to draft will be 112,831. These figures are based on the total number of men employed in the industry being 720,971 as reported by the Geological Survey" (for the fiscal year ending June 30, 1917).

The figures Mr. Lewis gives for coal production lost by car shortage are quite inadequate. One hesitates therefore to quote them. The tonnage lost in 11 months by the unions reporting was 8,577,883 tons. What Mr. Lewis thinks of these figures is shown by the statement: "It is estimated that with the same force of miners and mine laborers employed in and about the mines, without the addition of new machinery, more than 920,000,000 tons of coal can be produced annually in the United States, an excess production of 3,000,000 tons over America's maximum demand." However, much that Mr. Lewis says about the labor shortage is only partially truth.

Miners are veritably scarce in the anthracite region. In the bituminous region they are only scarce in proportion to mine capacity. In many of the bituminous regions of the East it is certain that more men are little needed. They might load the cars supplied a little faster if they were there, they might clean the coal a little better if they were competing with one another, but they would be idle much of the time. Many of the idle men in other industries, concerning whom Mr. Lewis speaks, should be idle as long as they persist in continuing at unwarworthy tasks. Warworthy industry would soon absorb them if they would transfer their much-needed services, but like the miners they take to a new job as unwillingly as they would to a new nationality.

Tremendous Drain Placed on the Coal Industry

Take from the coal industry the 112,831 men subject to draft, and take as many more into munitions work, and you will get a most acute shortage in the anthracite industry and a real stringency in the bituminous mines. Five men in 100 are gone to the army and 18 men in that 100 are yet to go and then doubtless some more. Who will not say that the strain will be tremendous.

When we get a drain equivalent to that which has been made on the smaller English-speaking man power of the British empire—in which nation 7,500,000 have already been enlisted or drafted—we shall find that there is a real shortage of men. No one can but sympathize, however, with those who look askance at yellow labor as a means of meeting the question and who wait to solve the problem till the moment when it becomes more painfully apparent and who feel that when all labor is converted to war work will be time enough to talk about inviting, like France, the coöperation of the patient but unassimilable workers beyond the seas. It is well, however, to let them know that it is in the farming district that men are most needed and not in the mines. It is doubtful whether even idle miners would be willing to go back to the farms. Those who talk yellow labor most earnestly are seeking to introduce it in the raising of foodstuffs so that our mining and manufacturing men will have food to eat.

Miners Make Complaints in Illinois

The mine workers of the Illinois subdistrict No. 5 in central Illinois have a new Ways and Means Council, composed of representatives of the various locals. It meets every 60 days and undertakes to better such conditions in and around the mines as are not sufficiently general to be taken care of in joint conferences. Disputes growing out of conditions peculiar to a single mine have been a prolific cause of local strikes and have retarded production to no inconsiderable extent. Officers of the union say that this Ways and Means Council is intended to afford a means of settling these disputes and of averting local strikes. It seems, however, to have an entirely different purpose and to be disposed to break contracts and make trouble.

Miners Don't Want To Pay Carfare

The council met the other day at Springfield and discussed compensation for the removal of impurities from the coal, free transportation to the mines, abolition of overtime and increased compensation for miners who work in "bad places." It seems that in the Springfield district a considerable amount of fireclay mixes with the coal when it is shot and as a fine is imposed upon the miners if any of the fireclay is found in the cars, the miners expend time and labor in keeping the coal clear. For this work, according to the resolutions adopted by the council, they believe that they should receive reasonable compensation.

It was further resolved that where the mines are opened so far from the dwellings of the miners that train service is necessary, it should be furnished free by the operators. It was resolved that overtime be abolished except in case of extreme emergency involving danger to life, limb or property, and should then be paid for at the rate of time and a half, Sundays to be considered overtime. A demand was made that $5 a day should be paid for men compelled to work in "bad places."

EDITORIALS

The Heart of the Trouble

THE interview with Dr. Garfield printed on the foreword page of this issue will leave in the mind of the careful reader one big outstanding fact, and that is that this country is suffering more from a shortage of motive power for transportation than from any other cause.

It is all very well to talk of car shortage, and no one doubts that we have too few cars; but even if we had an abundance of cars, there are not enough locomotives to pull them from the mines and mills to the markets. Locomotives cannot be built in a day or in a month. During recent years, the railroads of this country have ordered less than one-half as many engines as are required to maintain transportation lines on an adequate basis of operation.

The pity of it all is that while American industries have been developing at an unprecedented pace the one vital link in the chain has grown weaker until the final break has come. In an emergency that threatens the life of the Nation we find ourselves helpless through our inability to transport the things we manufacture. No quick remedy can be provided. There is only one way, and that is to promptly increase the efficiency of locomotive service and of car service.

We can no longer dally with the situation. Stern measures must be adopted. The Fuel Administrator is right in saying that we must abolish all cross-hauling, that we must put into operation an intelligent zone system, and above all else that we must make it prohibitive for any individual or any company to hold goods in a railroad car longer than 24 hours. If the situation is as critical as we are told it is, then a demurrage penalty measured in dollars is not enough. It would be well to establish a ruling that will carry with it the penalty of imprisonment for anyone who does not unload freight within 24 hours. The Government being the worst offender, of course, there would be a small army of quartermasters in jail; but it is likely that before long freight and coal cars would be unloaded promptly. Let us all prayerfully hope that Director McAdoo will act promptly and effectively.

Need for Anthracite Inspection

THE frequency with which one hears complaints of the impurity of anthracite leads one to feel that an anthracite inspection service should be established. There is no question but all the reputable elements in the anthracite region, probably over 95 per cent. of the shippers of anthracite, would be glad to submit their shipments to an impartial force of inspection. In that manner they would be able to maintain the reputation of the region for honest methods. They are beginning to fear that the public, finding slate in the coal in large quantities, will blame companies indiscriminately or rather will select the largest companies, who are invariably held to be at fault whenever anything goes wrong.

At the meeting of the Engineers Society of Northeastern Pennsylvania, held in Scranton, Jan. 17, one of the Canadian representatives, Major M. S. Boehm, 169th Battalion Canadian Infantry, said that "Coming up on the car to Scranton from Wilkes-Barre . . . I heard it said that the operators were adulterating the coal sent out. If that is true, and I only quote it as I heard it, and I do not wish you to think that I indorse the statement, it is the most damnable piece of traitorism possible in a free country. It is a dastardly act, if true. Remember, gentlemen, we are standing on the brink of hell. It is all over if Great Britain and America lose the war and just at present we are not winning it."

On the authority of one of the leading anthracite coal men, there was a little too much truth in that statement for the anthracite mining men to feel quite easy. Probably there is no coal actually adulterated, but coal is being put out from culm banks or from some other sources where not the slightest pretense of cleaning is made.

A record of the impurity found by one large company showed the slate to run from 25 to 50 per cent. in eight different cars. This coal was not shipped by the company making the investigation, but by one of the so-called independent companies. It is not to be assumed, of course, that the independent operations are usually irresponsible and ship slate and bone coal in excessive quantities.

In fact this is probably by no means true of the older independent operators; but there are some fly-by-night concerns which have purchased rocky coal dumps and lack both conscience and the facilities for making an adequate separation of impurities. One would-be coal producer recently sought to buy a coal dump and had the effrontery to tell the representative of the coal company owning it that he would pay more for it than it was worth to the company because he could ship all the impurities with the coal, whereas the corporation having a well-established clientele and an unbending conscience, would stand by its standards of preparation and ship nothing but clean coal.

It is remarkable with what persistence in the face of the urgent demand and the shortage of cars and labor the coal companies are standing by the old-time purity standards. One company, by no means the largest, is trying to maintain its former scale of purity, and in doing this is condemning 40 cars of coal a day and sending them back to the breaker to be recleaned. With all the anxiety for coal, and in view of the car demurrage thus caused, the action seems too finical rather than not finical enough.

Another company does not condemn cars which have a single per cent. excess of slate. To do so would put a car out of action for 24 hours. The men have instructions to make a careful cleaning of the upper two feet of coal, and as more than one per cent. of slate is removed the coal in the car is brought well below the per-

mitted figure. However, while thus keeping the slate content below the limit it does allow a little excess undersize coal to pass muster.

At the present time the breakers are usually crowded to capacity or beyond their rating. Their efficiency is a trifle reduced by that fact. Those breakers which still depend on men and boys are apt to be undermanned. For this reason, there is a tendency to keep a little nearer the upper limit of slate content than is desirable.

There is no disposition observable to depart from the strict rulings of past years. The larger anthracite operators would be pleased apparently to see everyone made to toe the mark which they have always been willing to line themselves by. The large concerns especially, which have railroad connections, are not a little chagrined to know that inferior coal is being sent to market and to see it sold under the cachet of the Fuel Administration at a price 75c. per ton higher than they are allowed to charge for far superior coal.

Poor coal is not shipped in large quantities, but the man who gets it is as painfully present as a sore thumb. The man who gets a large percentage of slate can say as much as the fifty men who may have bought clean coal. Thus the word is spread that all anthracite operators are rogues, and the public egged on by the newspapers is only too ready to believe it. Inspection would not be difficult. The present inspectors with a little transference might do the work under the authority of the Fuel Administration, the Committee on Coal Production or the Bureau of Mines.

Rock Dumping

THE work of rock dumping varies greatly with the depth of spoil to be deposited and with the secondary purposes kept in view in doing that dumping. The most economical dump is a high one. Fortunate, indeed, is the concern which has a dump from 150 to 300 ft. high, so that the cost of building out to extend the dump occurs only infrequently and the cost of widening the approach to the dump is not too expensive. Where the dump is shallow, it daily goes forward and side dumping must be kept up continuously. Where the dump is high, it is best to have two dumps and advance them alternately. When this is done the idle dump has time to complete its inevitable sliding before the dumping trestle is built out over the uncertain foundation, and somewhat greater boldness in extension is therefore possible when that work is done. The extension, also, when completed, has to be jacked up less often.

A freezing spell, or may be a flood of water in the run below—there is usually a run or else a discharge of water from the mine—will carry away some of the rock and perhaps make it both profitable and desirable to go on dumping for a while without extending the trestle. However, whether extension is necessary or not, the dump is solidified during the month's rest and the extension work over the top of the dump brow is fraught with less risk of an undesirable subsidence. It is not well, if it can be avoided, to have water passing under a dump. At any time it may dam up and carry away a huge slice of the fill, breaking the continuity of an important part of the mine work—dumping rock—and filling up a valley for which the mine manager may have other and better uses.

Miners' Time Should Be Saved

A STRIKE is threatened of between 4000 and 5000 mine workers at Shamokin, Mount Carmel and Kulpmont, Penn. The men want the Shamokin and Mount Carmel Trolley Co. to restore the 5c. fare and the Pennsylvania R.R. to reëstablish a miners' train between Shamokin and Mount Carmel. The trolley company has just raised its zone rate to 6c.

The company is to be congratulated that it has been able to make such an increase in rate in view of increased operating costs. It is a pity that it cannot be done everywhere. The trolley companies are near the end of their string. In a very short while they will collapse like the railroad companies, and then the miners will walk to their work or stay at home.

The miners are suffering a great deal now from slow and inadequate transportation to their work. In Scranton the trolley cars are altogether too few, and it is the same everywhere. If 1c. or 5c. more per mile will assure service, the mine worker will be able to make up the difference a dozen times at his work. It is a trying matter to wait hours in the snow and then while riding to make slow time in cold cars.

We must pay for what we get. Starve the street-car companies, and they will leave you freezing at the street corners. Cheap service is poor service. One cannot blame a man for being a little niggardly who works by the day, but the man whose wage is determined by how much he performs can easily afford a few cents to an agency that helps him to do more and do it in relative comfort.

If it were unreasonable to pay it, this advice would not be given; but it is not an unreasonable demand. If the miners were running the cars and not riding in them, they would soon change their point of view. The condition is nation-wide. Coal is lost daily by inefficient street-car transportation, and the street-car companies should be helped by higher fares and required to give good service.

In conclusion, let us analyze the time value of two cents. After all, "time is money" to the poor man as also to the rich. If the rich man will give $8 to be speeded a couple of hours from New York to Chicago, perhaps the workingman would be justified in risking a penny to be speeded on his way from his home to his colliery. If a workingman makes $5 in an eight-hour day, he is getting 500 cents for 480 minutes of work. That is, he is receiving a penny a minute. So if he can save a minute a day by a satisfactory and adequate service, it is well worth a cent to him.

Too lightly, indeed, we regard today the infrequent schedule and the overcrowded and unheated car service. These features might be overlooked in a metropolis, for they save coal; but in a mining community, where coal need not be saved, because it does not arrive by railroad, there is no reason for making the schedule less frequent, the space in the car more crowded or the comforts less grateful, unless it be because of the growing cost of the service. Surely this should be a small objection with increasing wages. Must the miner be the only one to be accorded an increase to offset the cost of living? He is always regretting the rising costs, but secretly he believes that he alone should be allowed an advance proportionate to his increased expenditures.

Felhivás a Magyar Bányászokhoz!

(True translation filed with the postmaster at New York City on Jan. 16, 1918 as required by the act of Oct. 15, 1917)

Ha bármely országban háboru üt ki, mindazok, akik az ellenség országához tartoznak, fogolytáborba lesznek küldve.

Az Egyesült Államok nem tette ezt. És nem is fogja öket fogolytáborba küldeni mindaddig, mig nyugodtan folytatják munkájukat es nem okoznak zavart.

Senkisem fogja munkáját elveszteni, mig kötelességét teljesiti. Mindaddig, mig a magyarok rendesen viselkednek, az Egyesült Államok épen úgy fog velük bánni, mint saját polgáraival.

Megtakaritott pénzükhöz, vagy birtokukhoz nem fog hozzányúlni. A magyar bányászok csak hálásak lehetnek az Egyesült Államok e nemeslelküségéért.

Jóakaratukat csakis úgy mutathatják ki, ha nyugodtan es állandóan fognak dolgozni. Ezen nemzet és a bányatulajdonosok szivből elismerik mindazon magyar bányászok szolgálatait, kik állandóan dolgoztak es képesek voltak nagymennyiségü es tiszta szenet bányászni.

DISCUSSION BY READERS

Seasonal Freight Rates

Letter No. 1—In an article entitled "The Principles of Coal's New Program," which appeared in a recent issue of a prominent coal-trade publication, it is stated, "If perfection is to be even approximated, certain methods of forceful persuasion must be allowed those who produce and distribute coal."

The writer of the article carefully refrains from mentioning any of the methods he may have in mind, but I presume they are such as will tend to stabilize the industry by securing as nearly as possible a uniform monthly production and distribution of coal to consuming territories. One of the most important of these methods, I remember, was strongly advocated, in several communications some time ago, by a correspondent of the same paper, but it seemingly attracted little attention.

The correspondent urged the adoption of "seasonal freight rates." If it is true, as was stated in an address made before the Railway Coal Purchasers' Association some years ago, that operating costs for moving freight are 30 per cent. less in the summer than in the winter season, then it would seem that the railroads could profitably make a summer rate of from 20 to 30 per cent. less than winter rates, and still keep up their equipment and service during the months when traffic fell off and so relieve the pressure during the winter months. It seems reasonable to expect that this proceeding would, at the same time, provide that "forceful persuasion" that acts automatically.

In normal times, no retail dealer or power producer can safely take the chance of storing large quantities of coal, in view of the fact that January prices have often been nearly as low as those current the previous July. On the basis of 600,000 tons production of hard and soft coal there was enough open-car equipment, a year ago, to allow a time allowance of 26 days for each car, per round trip. With the elimination of long distance movements where the quality needed can be secured at nearer points, the present coal-car equipment, not considering box-car shipments, should be ample for distributing 750,000 tons per annum, if moved in approximately equal monthly installments, providing, of course, something is done to increase and conserve motive power.

Chicago, Ill. R. T. McKEEN.

The Mine Gatehouse

Letter No. 1—The suggestion of establishing a gatehouse at the entrance of a mine, for the purpose of checking all persons going in and coming out, which was made the subject of a Foreword in *Coal Age*, Dec. 8, is timely and important to the economical and safe operation of every mine employing from 50 to 100 or more men.

Even allowing that there is already in use in a mine a good checking-in-and-out system, the idea of a gatehouse at the entrance presents many advantages. When properly located and equipped, and with an active, intelligent man in charge, it would be possible to keep a complete record of all men and material passing in and out of the mine. This record would frequently prove of great value in the checking up of accounts, proving timesheets and giving other valuable information in respect to the operation of the mine.

My experience during the past twenty odd years convinces me that a large mine is incomplete without the establishment of a well built and thoroughly equipped gatehouse where the daily input and output of the mine would be fully recorded. Here should be stationed the mine clerk, whose duties would be to check all persons and material passing in and out of the mine. The record should be made on a properly prepared timesheet. There should be a reliable clock for the purpose of noting the time of every transaction.

The advantages of such a system can hardly be overestimated. It would wholly eliminate all chances of defrauding the company, by men slipping in and out of the mine at times suited to their own convenience. It would settle all disputes that so frequently arise on payday, by men claiming time for which they have not been credited and cars of coal that, perchance, were never loaded.

The gatehouse, moreover, would act as a stimulus for men to be on hand on time in the morning. It would systematize the entire work of the mine and, in doing this, would more than pay for itself in the reduction effected in the cost-sheets. These are not rambling thoughts but clear facts that warrant careful consideration by all coal operators. R. W. LIGHTBURN.

West Leisenring, Penn.

Climbing

Letter No. 1—The Foreword in the issue of *Coal Age*, Sept. 22, opens the way to a most interesting and instructive discussion. It presents the case of a mine clerk, who, as office boy, let it leak out that it was his ambition to some day be president of the company.

The writer of the Foreword admits that the hero of his story was an "exceptional man." He had the ability to search into the causes of things—in other words, to analyze a situation—which proved the key to his rapid advancement, from office boy to clerk, timekeeper, assistant to superintendent, and special investigator for all the company's mines.

Personally, I will confess to having sat up many nights in an endeavor to unravel the mystery of the phenomenal success of men. I have read articles and devoured books on "How I Became General Manager," and kindred subjects. My trouble seems to be, however, an inability to reduce these elements of success to a principle that would apply to my own case.

The success of other men appears so frequently to have resulted from some particular circumstance that

served to unlock the door of fortune to the individual in question. Either the man inherited a large sum of money that enabled him to make a start in business, or he had an uncle or other relation that brought him to the notice of the president of a large company, and so on down the scale.

The secret of success seemed to lie generally in some outward power or influence rather than in the individual himself, and this gave me little satisfaction. I was soon convinced that the reading of one or another man's rise in the world was of no avail, except in the way of stimulating one's ambition. The means of following the same road to success he must divine for himself. The account of another's struggles against obstacles and difficulties is stimulating to the man who has the desire to rise; but, further than this, he must build his own fortune.

It has been my good fortune to meet, in my travels, men who are making history today and to learn from them some of their experiences. Among these, I might mention Bonar Law when yet a business man, Captain Scott when on his last voyage to the South Pole, General Botha immediately after the Boer War, and others.

A Glance Backward and What It Teaches

Looking back at these interviews, each of which impressed me as having some superlative quality, I cannot say that had these men been present in a crowd before me I would have picked them out as possessing qualities that would enable them to stand before the world as leaders of thought and action. Among mankind there are many endowed with equal brains and possessing equal capital and social standing with these men and who, yet, fall far short of their attainments. I have asked myself, Wherein lies the difference?

I have no great confidence in my ability to formulate correctly the attributes of success in life. Briefly expressed, my creed is:

1. Work, not merely from a sense of duty but from a soulful interest. When a worker is interested in his task, his labor is made easier. For this reason a man should choose a business to his liking. Successful labor often means the setting aside of the pleasures of today for the opportunities of tomorrow, which appeals to me as the first step in the ladder by which the climber mounts the pinnacle of fame.

2. Analyze the situation or the work to be accomplished so as to have a clear conception of what is required and the best means to attain the desired end. In this manner waste of time and effort will be avoided and greater results will follow and the worker become daily more efficient. This ability to analyze promptly and correctly gives a man a firmer grasp of a proposition and appeals to me as one of the underlying basic characteristics of all successful men.

3. Get your sailing orders before starting. In other words, know the object to be attained and plan beforehand for its accomplishment. Look forward, each day, each month and each year to doing larger and better work than in the preceding day, month or year.

Of these three essentials, let me say that work—pure work—the ability to plow steadily on through alternating success and failure is the real test of a man and presages his ultimate success. Opportunities come and go in the lives of men, very much as good and bad times alternate in the industrial world. To win success, the man must have a fixed determination to outweather gales of disappointment and ill-luck, doing faithfully and persistently the work before him while awaiting his opportunity to rise. KAPPA.

Ottawa, Canada.

Conservation of Mine Gas

Letter No. 2—In response to the requests of friends, I had promised to arouse the question of the conservation of the large quantities of natural gas generated in our mines. While I have been considering the matter, however, my old true and tried friend, Eugene B. Wilson, of Scranton, Penn., has started the ball rolling, by his letter, which appeared in *Coal Age*, Dec. 15, p. 1029, and in which he refers to the attention drawn to this subject by Governor Martin G. Brumbaugh, who conferred recently with men summoned from different sections of the coal field, in order to ascertain their opinions as to the feasibility of such a project.

To discuss this question intelligently, and give the subject the prominence it deserves, it will be well to review the remarks, verbatim, with which the governor addressed the 18 men, heads of the various Boards of Trade and Chambers of Commerce in the anthracite region, who assembled at his request, in the executive chamber of the capital, at Harrisburg, Nov. 23, 1917.

Governor Brumbaugh's Address

I wish to thank you, gentlemen, personally, and the important business organizations you represent, for coming here at my request today. The call was indefinite, in terms, because I did not think it wise to have any preconceived ideas in your minds as to the purpose of the conference.

As you know, this administration has in the past three years endeavored to impress upon our people the great need of conserving our rapidly disappearing natural resources. Pennsylvania was at one time the reservoir of greater natural and potential wealth than any other state or country. This wealth has been steadily disappearing with no adequate return to the people now in the state, and no provision for those yet to come.

The great anthracite region which you represent is a good illustration of this situation. Some of your most thoughtful citizens are questioning the future of your cities and your industries. The time has come to take note of the resources now remaining and to use them for the good of this great region.

While I have in mind a special and specific problem, I wish at the same time to name a few other matters of moment to the good people of your great counties; and all of these are, in a way, related to the great problem that I desire to lay before you.

First. The firedamp explosions that occur so frequently are a menace to life and a loss to the community. Life is sacred and its safeguarding is our solemn duty. I ask you to keep in mind the need of reducing the hazard from gas to a minimum, and if possible avoid it entirely.

During this great war we are speeding up all forms of industry. Pennsylvania is so commandingly essential to the nation and to the welfare of civilization that we must give, and give liberally, all the supplies our skill and our endeavor can produce. Thousands of our skilled miners have gone into the service of our country at the front. Their places must be taken by others doubtless less experienced in the work of the mines. This creates a double menace to the region you represent. I call upon you and, through you, on your great bodies of thoughtful business men to see to it that peace and tranquillity prevail during this stressful period. Let no excitement, no unusual ac-

tivity be encouraged; for the result may be disastrous in the extreme. Let labor be encouraged to keep quietly content and steadily busy in productive service to the country.

Allow no strikes. Frown upon the first move to cause a cessation of output. The man who today foments strife and encourages strikes is a traitor and will, so far as I am concerned, be so regarded. There are other and better ways to adjust the problems of labor and capital, and I appeal to your bodies to support me in my fixed resolve to keep Pennsylvania free from disorder and industrially loyal to the Government in this supreme hour.

The Mine-Cave Problem Serious

The mine-cave problem is an acute one. It is on my mind daily. It has developed a situation for which our constitution makes no provision. By the decrees of our highest courts the rights of property have been held sacred. By the judgment of the community the safety of human life is menaced by the removal of coal under your homes. The constitution holds that life and property are alike sacred and inviolable. This conflict, therefore, is unique and I had by counsel and conference hoped to have some legislative relief for you during the past session. For reasons known to you, no such enactment has reached me. The Legislature having failed you, I ask you if possible to get together and amicably and peacefully solve this serious situation.

And now the real purpose of this conference, a purpose of great moment to the anthracite region, is the outgrowth of numerous conferences based upon an idea first conveyed to me by William S. Tompkins, of Wilkes-Barre. There is escaping daily into the air about 72 000 000 cu.ft. of gas from our mines. This is estimated to be the equivalent of about 14,400,000 hp.—a volume of power unequalled. It would belt the German empire with a sheet of fire. It would, if used, release for home consumption many thousands of tons of coal that could go over the mountains to those that need it and there would return a stream of wealth to our people. Moreover, it would open the way for a new and greater anthracite region, whose whole economic outlook would be speedily changed from an unstable to a stable situation. The more complex and varied your industrial activities the more stable your economic life. If this gas were harnessed to industry in your region you would become the most progressive and dependable industrial center in the world.

"Watch Some Fellow Do"—the Impossible

I know you will think this cannot be done. Everything we now prize was once impossible. The history of civilization is the story of the accomplishing of the impossible. When you go home and the pessimists and the inert and the short-visioned, sour-visaged man says it cannot be done, please give him a copy of my motto—"When it is finally settled that a thing is impossible—watch some fellow do it."

My practical suggestion is that your great bodies, so well represented here, join in a movement to pay five or ten or even fifty thousand dollars to the genius that will harness this enormous waste and make it the servant of industry in communities. It will be money well invested and it holds the destiny of the great coal region we love. I shall help in any way I can. What is for your good is for the good of Pennsylvania. Our interests are identical. For the welfare of the state and the great good of our people, let us take up this problem now. I lay it before the solid, substantial business men of the region, through you, confident that you will solve it and solve it in a commanding way.

At the conclusion of the governor's address there was some discussion of the subject by those present. H. C. Hubler, president of the Scranton Board of Trade, asked the governor if this matter had been taken up with the coal companies, and received the reply that "it had not," whereupon Mr. Hubler intimated that it might develop that the coal companies owned the gas. The governor admitted that that was possible, but stated that it was a matter for the organizations represented by those present to work out the question of ownership, the main point being the conservation of the gas that is now being wasted and doing no one any good.

Replying to the statement of William S. Tompkins, of Wilkes-Barre, to the effect that "all that was necessary to get plenty of gas in Wilkes-Barre was to put down a borehole on the court house lot," I stated that, "such a plan had been tried out on the Kingston flats, in Nanticoke, and in Hanover township, by the Delaware, Lackawanna & Western Railroad Co., but their efforts had proved a failure."

At this juncture, Mr. Warwork, of Mt. Carmel, flashed the governor's card, "when it is finally settled that the thing is impossible—watch some fellow do it." The adoption of this motto leaves nothing to be done save to "watch," and I must admit that, in common with my friend, Mr. Wilson, of Scranton, former editor of *Mines and Minerals*, I have been watching and listening since, but the other fellow, who is to do the trick, has not yet appeared.

Watching and Waiting Never Accomplishes Anything

Evidently, if anything is to be accomplished along this line, it will not be by watching and waiting. I take it that the meaning of the governor's remark was that what seems to be impossible will eventually be done by the man who thinks and acts. I trust that this will only prove the beginning of a broad and liberal discussion of a subject, the realization of which would be an untold boon to communities throughout the coal regions.

Mr. Wilson has already given the chart showing the flow of gas from different collieries as tabulated by Mine Inspector Joseph J. Walsh. It was on the information conveyed to him by these charts that the governor based his remarks, and I will take the liberty of drawing special attention to the data relating to the Auchincloss colliery, operated by the Delaware, Lackawanna & Western Railroad Co., and located at Nanticoke.

The Auchincloss colliery is working one of the most gaseous seams of the Wyoming coal fields and the two shafts, known as No. 1 and No. 2, are producing, according to the chart, a total of 6,743,000 cu.ft. of gas each 24 hours, or 280,958 cu.ft. per hour. Now, assuming this gas is burned in gas engines consuming, say 25 cu.ft. per b.hp.-hr., and allowing for some waste by leakage, there appears to be a loss in the gas wasted from these two collieries of over 10,000 hp., which is almost beyond conception.

The Estimated Loss of Power

My friend, Mr. Wilson, has estimated a total loss of 400,000 hp. as resulting from the reported flow of 72,000,000 cu.ft. of gas in 24 hours throughout the anthracite field. These figures are certainly impressive, and Mr. Wilson has asked the question that naturally presents itself to all of us, "How can the escaping gas be collected?"

While there is no question that gas can be got from the coal-bearing strata of the Wyoming coal field reaching from Pittston to Nanticoke, there is considerable question whether it is possible to collect the gas diffused

in the air currents discharged from the several mines in this region, so as to make the undertaking a commercial proposition.

It is well known that there is a wealth of gold lying at the bottom of the ocean, but the cost of reclaiming this treasure would more than equal its market value, and it is therefore worthless in its present state. Perhaps the same is true of the gas-charged air discharged from our mines.

However, it has since been explained that the idea was not to separate the gas from the mine air; but, by adding artificial gas to the mixture, make it available for industrial purposes. This may be a suggestion worthy of consideration, and it is to be hoped that *Coal Age* readers will be able to make further suggestions that will ultimately bring this proposition to a successful issue. I am permitted, through the courtesy of R. V. Norris, consulting engineer, Wilkes-Barre, Penn., to present the following interview published in the Wilkes-Barre *Record*, giving his views on the waste-gas question.

CONSULTING ENGINEER R. V. NORRIS INTERVIEWED

Ques. 1—Is gas present in all coal mines?

Ans.—Yes.

Ques. 2—In what quantities is gas generated in mines in the anthracite coal fields?

Ans.—Mines in this field use from 8 to 20, say 12 tons of air per ton of coal produced. This air is always kept below the explosive point and generally contains less than one-half of 1 per cent., or, say an average of ¼ per cent. of gas, which would be high. On this basis, the production of 1000 tons of coal would correspond to a ventilating current of 12,000 tons of air carrying 30 tons of gas.

Ques. 3—How does this gas occur in mines?

Ans.—The gas is confined in the coal and oozes out from the surface, the largest quantity coming from the freshly mined coal. Quite rarely the gas is found in pockets, causing occasional outbursts in the mine. At times, gas issues as "blowers" from fissures in the coal, frequently in large quantities under considerable pressure.

Ques. 4—Can you estimate the extent of surface and the quantity of gas produced in these mines?

Ans.—A fairly representative colliery will have from 500 to 1000 miles of openings, including entries and rooms. Assuming the average height of the coal to be 6 ft., the exposed coal surface can be taken as, say 1½ acres per lineal mile, making 750 to 1500 acres of exposed surface in a single colliery. Assuming an average of, say 1000 acres of coal surface in a 2500-ton mine [generating 30 tons of gas per 1000 tons of coal mined] would allow an estimate of about 150 lb. of gas per day per acre of exposed coal surface [$(30 \times 2\frac{1}{2} \times 2000) \div 1000 = 150$ lb.].

Ques. 5—Can this gas be collected from the air current discharged from the mine?

Ans.—No. Practically speaking, no apparatus could be designed for this purpose.

Ques. 6—Is it possible to collect mine gas under any conditions?

Ans.—Yes, gas can be collected from blowers when these are of sufficient volume, by piping it out of the mine. The volume of the gas is not generally sufficient and the life of the blower is too uncertain to warrant doing this, however.

Ques. 7—Could not the gas be obtained from boreholes?

Ans.—Yes, there are several holes giving out gas, which have existed for years, but the quantity of gas produced has been small and not enough to warrant their general use.

Ques. 8—Could sections of a mine be walled off and the gas allowed to accumulate therein?

Ans.—This might be done in rare cases, in very gaseous workings, but it would result in a stoppage of mining in that vicinity, and the output of gas would probably be too small to warrant the undertaking. Such a proceeding would convert a coal mine into a gas mine and the output of gas would be small in comparison with that of coal. The danger of such an undertaking would be an effective obstacle, however, and inspectors would probably close the mine at once.

Ques. 9—Do you consider it a mechanically practical proposition to attempt to redeem the gas discharge from anthracite mines, for fuel purposes?

Ans.—In my opinion the scheme is not practical, with our present knowledge, except possibly in the case of certain blowers. The output from these, however, would be so small as not to warrant the installation of the necessary gasometers and distribution sytem that would be required for the commercial use of the gas.

The waste gases from furnaces, in rolling mills, and from blast furnaces, are extensively used for fuel and lighting. The process is limited, however, to the places where such furnaces are located; and, in order to protect the furnaces from the danger of backfiring, it is necessary to install water seals and blowout doors.

I hope this question will be thoroughly discussed in *Coal Age*, to the end that some practicable scheme, if possible, may be devised to utilize the estimated waste of power in the gas escaping in such great quantities from our mines.

Wilkes-Barre, Penn.

Blacklisting To Prevent Accident

Letter No. 6—I was greatly interested in the Foreword that appeared in *Coal Age*, Dec. 1, in which James T. Reynolds emphasizes the importance of mine discipline.

Mr. Reynolds cites an instance where he saw men leaving the mine by way of the hoisting slope. On drawing the foreman's attention to this dangerous practice, he received the reply that it was "hard to control men." The foreman stated that he had warned them that they were violating the mine law, but feared to insist further on their stopping the practice, as the company were badly in need of miners. The suggestion of Mr. Reynolds that the foreman place a danger board at the top and bottom of the hoisting slope and make an example of the first man to go out that way was not carried out. A few days later, however, two men were killed while traveling the slope in disobedience to orders.

It would seem, from this citation, that there was a great lack of discipline in the mine here mentioned, and one is led to ask why the inspector did not compel compliance, on the part of the mine foreman, with his orders in reference to placing danger signals at the top and bottom of the slope. In my opinion, a mine inspector should have the authority to arrest persons violating the mine law. Without this authority, how can it be expected that he will be feared or respected and his orders obeyed.

Following this Foreword, Mr. Reynolds, in his letter in *Coal Age*, Dec. 15, p. 1028, makes the suggestion of "blacklisting men who are guilty of carelessness, indifference to orders, or insubordination in the mine." Such persons he styles "unsafe miners." While it is true that there are careless and indifferent miners who are prone to disobey orders and disregard safety rules and regulations and do not hesitate to violate the mine law, the fault for these offenses is largely that of the

mine foreman and other company officials in not exacting a more strict discipline in the mine.

Men are often made careless by the examples of disregard for safety set by the mine officials themselves. As instances of this, I could cite a case where the mine foreman marked the roof in many working places where posts were needed and told the miners working in those places that they would have to quit if the roof became dangerous, until such time as he could send them posts to make it safe.

At another time, I saw an electric wire crossing an entry, at a height of 5 ft. above the floor, where men and animals must pass and the wire was unprotected. The law requires a height of not less than 6½ ft. above the rail. Again, whole sections of mines are worked with half the air current required by law and the inspector reports the mine as "O. K."

Instead of blacklisting men, under such conditions as these, let me suggest that mine officials should set a better example and enforce discipline among the men, suspending them for violations of rules or disobedience to orders. In this way I believe it will be possible to make greater progress toward safety than by blacklisting men.

DANIEL F. SMITH.

Wellsburg, W. Va.

Favoritism in Mine Management

Letter No. 2—In his article, "Favoritism in Mine Management," *Coal Age*, Nov. 17, p. 862, Thomas Hogarth appears to consider but one side of the question. In fairness to both sides kindly allow me to take exception to a few of Mr. Hogarth's remarks.

Speaking of the changes made by a new superintendent when taking office, the writer seems to regard it as a general rule that changes made in the working force of a mine are apt to cost the company "thousands of dollars." While that may be true in some instances, it is not always the case.

For example, take a mine where the same men have been employed for so long a time that they have fallen into ruts and are using out-of-date methods that are wasteful and expensive and that should have been abandoned long ago. A new man brings with him new ideas and experiences, the application of which, instead of proving a loss, is the means of saving thousands of dollars for the company. It is often cheaper to make changes among the men than to attempt to alter their views or overcome their prejudices, which are often deep-rooted.

In regard to the statement, "Many men do not take kindly to working under a new boss," let me say that my observation is that the men who object to a new boss the most are those who have been favored by the old boss. When a new boss takes charge it is common for the men to look for changes, new methods, rules and regulations. They are very apt to make up their minds beforehand that these will not be to their liking.

Workers are prone to look with suspicion upon anything that differs from the old established way of doing things. They are not slow to pronounce a new scheme a failure, before it has been tested or given a fair trial. As we all know, there are men who get old on the job, so to speak, and are practically worthless in the positions they occupy. This class of workers is not always composed of men old in years but, rather, old in their ideas and slow of action. They do not care to be rushed but want to take their own time and way.

It cannot be doubted that many superintendents who have been in charge of a mine for a number of years have friends and favorites who are holding easy positions under their management. It is very likely that a new superintendent may find that these men are better fitted for other work. His observations may even convince him that they are incompetent or that long association with their particular duties has rendered them inefficient for the best service. Under such circumstances, it is not strange that a new superintendent, in justice to himself, would desire to change the order of things, even to the extent of getting rid of men that he considered in the nature of parasites.

Regarding the employment of old miners who have been disabled in the mines and are fit only for the performance of some light work, it is my opinion that a company might as well pension such a one and let him stay at home. To place him in a position or allow him to retain a position where the work he has to perform is not thoroughly done, or where his slow movements delay other work, would not be doing right by the company. An efficient superintendent quickly realizes these hindrances to the work, which it becomes his duty to remove. A disabled and faithful employee is often retained as night watchman or given other work that he can do without proving a hindrance to the operation of the mine.

CHANGES NECESSITATED BY FIXED PURPOSE OF MANAGEMENT

Hardly any two superintendents are alike, and, the fact that a new man introduces new schemes affords no reason for the claim that the required changes will increase the costs to the company. On the other hand, they may prove a means of saving much expense. Since it is results that the company and its management desire, no one can blame a new superintendent for changes he may see fit to make, providing these do not show special favoritism. In the filling of a position for which there are a number of aspirants, the superintendent must select the man he considers best fitted for the place, and the charge of "favoritism" so frequently heard is usually unjust, as all cannot hope to be chosen for one place.

Let us look at the question broadly and realize that behind every change in management and service the company has a fixed purpose involving improvements in ways and methods. The new undertaking will often necessitate employing a man of different capabilities from the one at present in charge. Likewise, the new superintendent has plans that he must work out to his satisfaction.

It is my belief that changes so often criticised as marks of favoritism are made on the ground of true merit and increased efficiency. The ascendency of the chosen one has often been gained by years of study and preparation. A superintendent that fails to recognize merit and fitness in such employees is not doing his whole duty by the company who employs him.

JOHN ROSE,

Dayton, Tenn. Former District Mine Inspector.

INQUIRIES OF GENERAL INTEREST

Corrosive Action of Mine Water

For some time past, we have sought to obtain some reliable information regarding the extent to which different metals are subject to the corrosive effects of acid mine water, but without success. If it is possible to give any definite answers to the following questions, in the columns of *Coal Age*, the information will undoubtedly interest a large number of readers who are troubled, as we have been, with corroding pipes, pumps and other metal equipment in a wet shaft. The questions are as follows:

1. What may be said to be the maximum allowable percentage of sulphuric acid in mine water, for the economic use of each of the metals, ordinary brass, wrought iron and cast iron?

2. Do the metallic salts of the acid, as copper sulphate or sulphate of iron, have any corrosive effect on the metals mentioned?

3. Will sulphur, in the form of a sulphate, in the coal burned under a boiler, form sulphuric acid in the presence of moisture?

Des Moines, Iowa. MINE FOREMAN.

These questions were submitted to a prominent electrical engineer who has experimented to a considerable extent to ascertain the causes of and relative effects of the corrosive action of acid mine water on different metals, and he writes, in effect, as follows:

Responding to your request for what information I can give in regard to the relative resisting powers of ordinary brass, wrought iron and cast iron when subjected to the corrosive action of acid mine water, and the maximum percentage of sulphuric acid permissible in mine water for economic use of these metals, allow me to say that it is doubtful if anyone can give the information requested with any degree of accuracy, and I do not care to be quoted.

However, for such as desire suggestions in line with our practice, it can be stated that, while we have never used brass in such service, I do not believe it would prove satisfactory in the presence of acid in the water.

In regard to wrought iron, we would not care to use it in contact with water containing any free acid, unless it was, of course, in a case of emergency.

Cast iron would probably give fairly good results with a very small amount of acid, but I cannot say what percentage of acid could be in the water and still permit of a fair life for cast-iron pipe.

Allow me to suggest, here, that there is one feature regarding the use of metal equipment in handling acid mine water, which I think is quite generally overlooked; namely, the electrolytic action that is always set up when two dissimilar metals are immersed in an acid solution and electrically connected.

We have made some experiments along this line to determine to what extent this action destroys the metal. We find, for example, that when a piece of acid-resisting bronze is electrically connected with a piece of cast iron and the two immersed in an acid solution, a disintegrating action begins that eats away the metal.

Our experiments showed that the iron was eaten away more rapidly and the bronze less rapidly than when each of these metals was immersed alone in the same solution. We conclude from this that if a bronze pump is used to pump water containing sulphuric acid, and is connected to a cast-iron discharge or suction pipe, the electrolytic action that takes place between the two metals through the medium of the acid water tends to prolong the life of the bronze pump, while it shortens the life of the cast-iron pipe.

In answer to the second question it should be stated that, while a truly neutral salt can exert no corrosive action on the metals mentioned, it is seldom that these salts are present without some free acid.

The answer to the third question is that sulphur existing as sulphate in the coal burned in presence of moisture would not form sulphuric acid.

Electrically Driven Mine Pump

We have a great deal of trouble with a pump that is located at the foot of a slope 800 ft. long and having a 25 per cent. grade. This pump has a 6-in. suction and a 5-in. discharge. The 5-in. discharge pipe is carried but a short distance from the pump to a point where it connects with an 8-in. pipe line that was originally laid in the slope for an air line. Being no longer required for that purpose, it was found convenient to make use of this 8-in. pipe for a discharge line for the pump.

The pump is electrically driven, the motor being self-starting. For some reason that we have not, as yet, discovered, the pump works badly, at times bending the piston rod and breaking the casting of the belt-wheel journal. At other times, the armature has burned out. We have been wont to attribute the cause to the large 8-in. discharge pipe, and I want to ask if a 5-in. pipe had been used all the way up the slope, would the same trouble have been experienced?

JOHN MARTIN,
Arden Mines, Penn. Mine Foreman.

From the data given, it would appear that the trouble is due to a lack of adjustment in the controller of the electric motor, which starts the pump too suddenly. The controller should be adjusted so that the pump will start slowly and thus be able to overcome the inertia of the water in the discharge pipe by degrees. The use of a 5-in. discharge line would be no improvement, as the pump would still work under the same discharge head. A good air chamber would greatly help to reduce the shock due to the inertia of the water in the pipe when starting the pump.

EXAMINATION QUESTIONS

Indiana Mine-Bosses Examination, Vincennes, Jan. 17, 1918

(Selected Questions)

Ques.—If you were mine boss, what orders would you give to timbermen in regard to making themselves safe while timbering an entry where the roof is bad?

Ans.—I would instruct them to sound the roof and examine it carefully to ascertain its condition before starting to set any timbers. It may be found necessary to stand one or two posts temporarily in advance of the timber frames about to be placed. I would tell them, also, to prepare all of their timbers back from the place where they were to be set, so that the work of framing the collars and posts could be done with the greatest degree of safety. Under no conditions should the men be permitted to expose themselves to danger while working under bad top.

Ques.—(a) How, in your opinion, should a mine boss examine a miner's working place to comply with the law? (b) What is the best known method of ascertaining when the roof is loose?

Ans.—(a) The Indiana mining laws require the mine boss to examine every working place in the mine, at least each alternate day when the men are or should be at work, and ascertain that the place is securely timbered and a proper supply of timbers on hand ready for use when needed. He must also see that all loose coal, slate and rock are taken down or made secure. If a place is found to be unsafe for work the mine boss should not permit the man to work there, until the danger is removed and the place made safe.

(b) The usual method of testing roof in mines, for the purpose of discovering any loose top, is to sound the roof with the butt end of a pick, bar or hammer, at the same time holding the other hand lightly against the top to detect any vibration or trembling, which can usually be felt if the piece is loose. It is not sufficient to rely entirely on the sound produced when the roof is struck with a pick or bar.

The roof must, also, be carefully examined to discover any slips or faults that would prove to be lines of weakness. The condition of the timbers standing in a place should also be carefully observed, in order to detect what movement or settlement, if any, is taking place, and enable one to form a more correct judgment of the strength and action of the roof.

Ques.—(a) With motor haulage, how would you protect the trolley wire along the main haulage roads to prevent accidents from same? (b) What system would you establish to govern motor haulage and what kind of markers would you use? (c) How would you arrange motors and wires, to prevent placing trolley wire across room-necks, where trolley motors are used for gathering purposes?

Ans.—(a) As far as practicable, the trolley wire should be hung on one side of the track, throughout the length of the entry, which should be the side opposite to that where clearance is provided to allow men to pass whose duties require them to work on the road. The trolley wire must be well supported by hangers fixed in the rib at regular intervals and not too far apart. Where it is necessary for men or animals to pass under the trolley wire, this should be supported at a height not less than 6 ft. above the top of the rail, and should be otherwise protected by an inverted board trough, which would permit the passage of the trolley, while preventing the accidental contact of tools carried on the shoulders of men. A suitable danger sign should also be arranged to warn men of the presence of a live wire.

(b) Where more than one motor is used in the mine, a careful schedule should be prepared that will make it impossible for a collision to occur in the movement of the trips. The motormen must follow the schedule precisely and run no chances.

A suitable marker must always be placed on the rear end of a trip of cars when starting from the parting on the inside of the mine with a loaded trip or taking an empty trip from the shaft bottom into the mine. Different markers are used, consisting of a gong operated automatically by the movement of the car, a danger board painted white and hung on the last car of the trip, or anything that will show plainly the end of the trip. The gong is generally to be preferred, because of the warning it gives an approaching motorman, by its sound. The danger of using a light is its possible extinction when the trip is running.

(c) The trolley wire must be placed on the side of the entry opposite to that from which the rooms are turned. In order to avoid the trolley wire crossing the entry, and to enable a trolley motor to operate in a room turned off that entry, the motor should be equipped with a reel carrying a cable that could be attached to the trolley on the entry when the motor is being operated in a room.

Ques.—(a) What are the duties of a fireboss as set forth in the mining statute? (b) What should the miner know before entering a mine which generates firedamp?

Ans.—(a) The Indiana mining law provides (Sec. 11) that every place supposed to contain explosive gas shall be carefully examined with a safety lamp, by a competent fireboss, immediately before each shift. The law requires the fireboss to leave evidence of his presence, at the face of every place examined, and makes it unlawful for any person to enter the mine, or any part of a mine generating gas, until it has been examined by the fireboss and reported by him to be safe.

(b) Every miner should know the danger of working in a place containing gas, and whether his place has been reported as unsafe by the fireboss. On entering his place, in the morning, and before proceeding to work, he should examine to see that the mark of the fireboss is there, showing that the place has been examined.

COAL AND COKE NEWS

Harrisburg, Penn.

The most important step ever taken in the affairs of the soft-coal industry was announced on Jan. 16, when acting under the direction of Dr. Garfield, C. E. Lesher, representative of the Federal Fuel Administration, met the bituminous operators of central Pennsylvania and informed them of a plan by which Dr. Garfield proposes to regulate the distribution of the soft-coal production of the country.

The country has been divided into eleven producing districts and twenty consuming districts. Each district is to have an administrator and three assistants, who will have authority to designate which industries are essential and which are nonessential in order that the bituminous production may be distributed where it will best serve the war needs of the country.

Three administrators will work with the state fuel administrators and Dr. Garfield's office. Barring these two superiors, they will be endowed with almost autocratic power.

The first thing to be eliminated by these boards will be the cross-hauling of coal. Each consuming market is to be supplied from mines on the nearest rail haul. No longer will coal from the West be shipped East, involving a double haul, or from the East to the West.

Under the leadership of T. H. Watkins, president, Low Volatile Association; Benjamin M. Clark, president, Central Operators' Association of central Pennsylvania, and Percy Madeira, president, Madeira Hill & Co., a resolution was adopted to appoint a committee of 15 members from both bodies to recommend a representative of the soft-coal operators as administrator for the central Pennsylvania fields. The committee of 15, it was decided, should sit as a permanent body until the end of the war, conforming to the custom of the anthracite operators in having the operators' committee as an official head through whom the Government may act.

The committee of 15 is composed of Benjamin M. Clark, Jefferson; Rembrandt Peale, Cambria; T. H. Watkins, Blair; Senator T. Larry Eyre, Chester; P. C. Madeira, Philadelphia; John Lloyd, jr., Blair; E. B. Chase, Philadelphia; J. F. Macklin, Philadelphia; Chester Langdon, Huntington; James B. Neale, Schuylkill; Senator Wilbur Graff, Indiana; Harry Boulton, Clearfield; John Cassley, Clearfield; Charles Owens, Cambria, and C. H. Jacobs, Philadelphia.

William Potter said this committee of 15 would be called upon to thresh out the details of a system that was originated by the coal men themselves. "There can be no come back," said the state fuel administrator, "on the grounds that they were not consulted or that the plan was theoretical and devised by men that did not understand the coal business."

The central Pennsylvania fields have a total of 60,000 miners and an annual production of about 60,000,000 tons. It was the sense of the conference that the headquarters of the administrator should be at Altoona, with assistants at Punxsutawney, Johnstown and Clearfield.

The conference was by no means a calm recital of a situation and a remedy. Some of the operators contend that the Government has not treated the operators fairly as to the matter of prices. The problem of distinguishing between essential and nonessential industries aroused uneasiness among the operators, the ground being taken that every contract on their books must be considered void until ratified by the coal administration.

Recommendations for the discontinuance indefinitely of all nonessential industries for the conservation of coal as a step to relieve the present shortage were made at a conference of anthracite operators, transportation and distribution committees called by William Potter, state fuel administrator. A resolution requesting the fuel administrator to use his influence in having the Government assign drafted mine workers to their present work was adopted.

A report of the general committee of anthracite operators stated that as the demand for anthracite was so great it was imperative that there be no waste either in its use or for nonessential purposes. The report continued: "The demand for anthracite has so enormously increased within a year that it is impossible to fully meet it with the largely reduced labor supply. It is a matter of utmost public and national importance that the present army of mine workers shall be kept in its highly essential service, that the men be exempted from draft and not drawn from work upon the full progress of which depends the supply of anthracite for millions of people."

Representative Frank C. Reese made public on Jan. 18 his investigation of the anthracite industry, which has occupied several weeks, with the assistance of a corps of clerks. Mr. Reese asserts that big coal companies are selling refuse coal from the culm banks to the public at full price, although, he says, this fuel rarely costs more than 25c. a ton to place on board cars, and with a charge of $1.70 for hauling should be sold in Philadelphia and New York at a cost not greatly exceeding $2.

He quotes Alfred B. Garner, former Congressman, as his authority that the coal from the Bancroft washery at Ashland is being produced at a cost of about 13c. a ton. This washery is typical of hundreds of others, he says.

While producers are demanding the highest price in all history for coal, Reese asserts, in the Schuylkill region, wherein lies the great bulk of unmined anthracite coal, lands worth untold millions are taxed at only nominal valuation. As the result of his investigation, Reese says, he finds that the coal districts in Schuylkill, which are the richest in deposits, place such a small tax on coal lands that many of the districts are verging on bankruptcy, while educational facilities for children are lacking.

Declaring that nine-tenths of the accidents in this state could be avoided, Harry A. Mackey, chairman of the workmen's compensation board, in an address during the week, advocated legislation providing for increased compensation. He spoke at a dinner given by members of thirty different labor organizations.

Notice is to be given by the State Compensation Board that hereafter all claims made for compensation on the part of aliens in enemy countries are to be made in the name of A. Mitchell Palmer, custodian of alien property. This action will bring the matter under the Federal Government, and awards will be taken care of by Mr. Palmer's Bureau at Washington.

PENNSYLVANIA

Anthracite

Coxton—Traffic conditions in the Lehigh Valley coal yards are in much better shape for handling coal than they have been for a long time. The relief from the congested conditions has been afforded as a result of an order permitting the Lehigh Valley R.R. to transport all of its eastbound coal originating in the Wyoming coal field over the Wilkes-Barre Mountains by means of the Jersey Central Co.'s Ashley planes.

Lattimer—The large stripping operation of the Lehigh Valley Coal Co., which has yielded more than 1,800,000 tons of coal since 1904, is good for but three years more at the usual rate of production, according to estimates of coal region observers.

Wilkes-Barre—For the immediate relief of householders who have not been able to obtain coal supplies, managers of four of the leading brewing companies in northeastern Pennsylvania on Jan. 17 announced the closing of their plants for a limited period. All teams, wagons and tractors will be given without cost to A. C. Campbell, fuel administrator of this district, to help in the delivery of coal. Drivers will be paid full salary by the brewers.

Wilkes-Barre — Saloonkeepers who sell to miners on their way to work will be considered unfit persons to have a liquor license, was a statement made by Judge Woodward, of Luzerne County, in considering applications for transfers. The judge also asked the applicants what time they proposed to open their places in the morning and what would be their closing time. This all indicates that the court may make some order regulating the opening and closing of saloons, as advocated by the coal operators.

Nanticoke—That the Susquehanna Coal Co. has been hit hard by the declaration of war is evident from the fact that 187 of its employees from this town and Newport Township are already in the service of the United States, 122 of these volunteering and 65 being drafted. Some of the men are already in French territory, while others are in training at the various camps in this country. Under the new classification of the draft system, 91 employees of the company have already been placed in Class 1 by the local exemption board.

Gilberton—The Harleigh-Brookwood Coal Co., which operates the Harleigh colliery, has leased a tract of coal land from the Philadelphia & Reading Coal and Iron Company.

Luzerne—The breaker of the Raub Coal Co., which was recently destroyed by fire, is being rapidly reconstructed. The colliery will not shut down, as was expected, but will resume operations. Coal will be stored outside until the breaker is completed. It will take about six weeks to rebuild.

Bituminous

Indiana—Another large coal deal was recorded here this week when David W. Simpson and County Commissioner W. Bruce Wagner, of Indiana, purchased the 138-acre tract in West Wheatfield Township from the John Patterson heirs, of Toronto, Canada. The land is underlaid with both the Upper Freeport "E" vein and the Miller "B" vein. The tract is near Heshbon, near the Cambria & Cresson branch of the Pennsylvania R.R. No plans have been announced for the development of the property.

Several mines in Indiana County were idle last Friday and Saturday on account of the several storms and cold weather. Power lines were down, the railroads were snowed up, and the outside labor refused to work in many cases. Work was resumed in full capacity Monday morning.

Chambersville—Fire, of unknown origin, destroyed three houses of the Seneca Coal Mining Co. here and rendered six families homeless. The fire broke out about 10:30 p.m. and the occupants of the house escaped clad only in their night clothes while the thermometer registered 8 deg. below zero. Very little household goods was saved by any of the families.

Tipperary—The Pensylvania Coal and Coke Co. has built several houses of the bungalow type at its No. 55 mine here. It has also erected a modern clubhouse for the use of employees which contains kitchen, dining rooms and rooms for the officials when they visit the plant. All the streets have been covered with crushed stone and ashes and rolled with large steam rollers. When all improvements are completed it will be one of the most modern mining towns in Indiana County.

Uniontown—J. G. Carroll, referee in bankruptcy for Josiah V. Thompson, former Uniontown banker and coal operator, on Jan. 17 issued an order for the sale of 12,000 acres of coal land to the H. C. Frick interests for $500 an acre, or a total of $6,000,000.

Altoona—About 300 business men and their employees, on Jan. 17, mobilized for the purpose of working on highways leading from near-by coal mines, that the daily coal supply of a thousand tons may be brought in by a motor truck fleet. Since recent snows travel to the mines has been reduced and many business houses have suffered for want of fuel.

WEST VIRGINIA

Charleston—All records for idle mines in Kanawha district on account of the shortage in cars have been broken. A total of 126 mines reported to the Kanawha Coal Shippers' Association on Jan. 17 that they were closed down for the day, throwing out of employment 10,068 men. Out of a total of 158 mines only 32 received sufficient cars to start work. The car supply was enough only for the loading of 7400 tons of coal, against an order from all mines of 62,530 tons, or less than 12 per cent. of requirements.

Clarksburg—The Winchester Coal Co., with chief works at Enterprise, has moved its office to this city, locating in the Elk Building. J. Martin Stark is general manager. The company is now arranging to open a new mine at Arden, Barbour County, and will develop a 125-acre tract of Pittsburgh coal. This will give the company two mines and both are expected to be worked to capacity.

Galloway—Announcement is made that the Simpson Creek Coal Co. has opened up two new mines at Galloway, Barbour County, West Virginia, in the Fairmont region. Coal is already being taken from 14 openings. The combined capacity of the new properties will shortly amount to 5000 to 8000 tons daily.

Monongah—The Ben Franklin Coal Co. is installing electrical equipment in its mine here. Power is to be supplied by the Monongahela Valley Traction Company.

Phœnix—The Alpha Portland Cement Co. is equipping the mine it recently purchased here with electrically driven machinery, furnished by the Fairmont Service Company.

Fairmont—The Fairmont & Connellsville Coal Co. is opening a mine on its property on Teverbaugh Creek. The Monongahela Valley Traction Co. is building a transmission line one mile in length to supply the mine with current.

INDIANA

Princeton—Fire destroyed the work clothes of 300 miners and other property to the amount of $5000 when the new warehouse of the Princeton mine was burned on Jan. 15.

ILLINOIS

Danville—With the opening of the Danville-Chicago division of the Chicago, Terre Haute & Southeastern R.R., a few days ago, three roads are rushing coal trains to Chicago from this section as fast as engines can be obtained. The Big Four and the Chicago & Eastern Illinois each accumulated 1500 cars here during the recent bad weather, which are now being moved.

Carlinville—The Standard Oil Co. has bought, in addition to extensive previous purchases, 80 acres of coal land from Mrs. F. W. Burton and 155 acres from C. E. Berry near here. Reports are that the company will spend $2,000,000 in development in the Carlinville district in the next two years.

Christopher—Preparations are being made to reopen the Christopher mine, which has been sealed since the explosion which killed 17 miners a few weeks ago. Two sections of the mine have been opened and inspected and found in good condition. Other sections will be unsealed in a few days. The mine employs between 600 and 700 miners.

Marion—The Powers Consolidated Coal Co., of Chicago, has purchased 1800 acres of coal land six miles southeast of here. The company will begin development operations at once. This has long been considered one of the best fields in Williamson County, but development has been hindered by lack of transportation facilities. The company will build a track to the Illinois Central. The deal involves an investment of $600,000.

Belleville—William Matthews, a miner employed at the Oak Hill mine, near here, pleaded guilty to committing a misdemeanor, and was fined $200 and costs. Matthews found the fuse of an unexploded shell in his room at the mine when he reported for work and set fire to it. The fumes necessitated the closing of the mine for the day. His only excuse was that he wanted to see what would happen. He was given his choice of a fine of $100 and 30 days in jail or $200 fine, and elected to pay the $200 fine.

A fire, believed to be of incendiary origin, last week destroyed the washhouse of the so-called "Nigger Hollow" No. 2 mine, near French village. In February, 1917, the washhouse was destroyed under exactly similar circumstances. The building just burned was modern in every respect and all precautions had been taken against accident or fire. The washhouse will be rebuilt as quickly as practicable.

Foreign News

Halmerend, England—The latest reports from official sources show that many perished in the explosion that occurred in a mine pit here on Jan. 12. Of the 247 workers in the mine at the time of the disaster, 87 have been rescued alive, and 23 bodies have been found. There is only a slender hope that any of those still entombed can survive. Nearly all the victims were young men and boys.

Personals

R. J. Morgan, formerly supervisor of sales for the American Steel Export Co., Woolworth Building, New York City, has been appointed assistant general manager of sales.

Herbert Devy, formerly mine foreman of Aultman No. 4 mine at Aultman, Penn., has been made superintendent of all the Aultman mines of the Jefferson & Clearfield Coal and Iron Company.

James Cummings, formerly superintendent of the Aultman mines of the Jefferson & Clearfield Coal and Iron Co., at Aultman, Penn., has been made superintendent of the Jacksonville No. 5 mine at Kent, Penn., of the same company.

Lyman Fearn, former mine foreman at No. 2 mine, Cumberland, Wyo., has been transferred to the foremanship of the mine at Superior, Wyo. Mr. Brown, who was connected with the Superior mine, is to be the new foreman at Cumberland No. 2.

James T. Reynolds, mine inspector of the Pittsburgh Terminal Railroad and Coal Co., of Pittsburgh, Penn., has resigned his position with that firm to accept a position as mine superintendent for the Houston Coal Co., with mines near Houston, Pennsylvania.

Frank J. Foley, formerly manager of the mining department of the Westinghouse Electric and Manufacturing Co., is now connected with the Edison Storage Battery Co., Orange, N. J., as manager of the mining and traction department, with headquarters at the main office in Orange.

W. D. McKinney, commissioner of the Southern Ohio Coal Exchange, has been appointed district representative for the Federal Fuel Administration in the Jackson, Crooksville, Hocking Valley, Ironton, Pomeroy Bend and Mason County fields. The last field is in West Virginia.

Wade M. Reed, for the past two years assistant to the superintendent of the Locust Mountain Coal Co. of Shenandoah, Penn., has resigned, effective Jan. 19, to accept a position as superintendent of transportation for the Delaware & Hudson Coal Co., with headquarters at Scranton.

John McBride, of Hazleton, Penn., who has been chief coal inspector for the Dodson Coal Co. for many years, has been named as superintendent of all the coal breakers of that concern. James Landers, of Girardville, has been named to succeed Mr. McBride as head of the coal inspectors. Mr. McBride is a practical breaker man and for many years was engaged by the Lehigh Valley Coal Co., in that capacity.

Obituary

E. C. Brown, of Patton, Penn., general manager of real estate for the Pennsylvania Coal and Coke Corporation, and an independent operator, died at his home in Patton recently. He visited one of his operations and caught cold; pneumonia set in and he died five days afterward.

New Patents

Mining Machine. N. D. Levin, assignor to Jeffrey Manufacturing Co., Columbus, Ohio, 1,244,871. Oct. 30, 1917. Filed Sept. 30, 1907. Serial No. 395,061.

Stoker Driving Arm. J. W. Bell, assignor to Murphy Iron Works, Detroit, Mich., 1,244,945. Oct. 30, 1917. Filed July 9, 1914. Serial No. 849,884.

Mine-Car Wheel and Attaching Means Therefor. F. H. Gibbs, assignor to American Car and Foundry Co., New York, N. Y., 1,245,142. Oct. 30, 1917. Filed Oct. 31, 1916. Serial No. 128,718.

Reclamation Service, and L. R. Ferguson, Engineer, Portland Cement Association. Department of Commerce, Technologic Papers of the Bureau of Standards, No. 95; 94 pp. of text, 44 pp. of plates, 7 x 10 in.

Industrial News

Gary, W. Va.—The United States Coal and Coke Co. has filed notice of an increase in its capital from $2,000,000 to $12,500,000 for expansion.

Oklahoma City, Okla.—The Golden Rod Smelting Co. has filed an amendment to its charter increasing its capital stock from $1,600,000 to $2,100,000.

Maitland, W. Va.—The Houston Collieries Co. is planning for the immediate reconstruction of its tipple recently destroyed by fire with loss of about $100,000.

Mt. Sterling, Ky.—Estill & Owings, who have been in the retail coal business here for many years, have gone out of business because of inability to obtain coal.

Williamsburg, Ky.—The Caudill Coal Co. has filed notice with the Public Service Commission of an increase in its capitalization from $35,000 to $60,000 to provide for expansion.

Bald Hill, Penn.—The Hetrick Coal Co. has awarded a contract to the Roberts & Schaefer Co., engineers and contractors, Chicago, for the building of its new retarding conveyor and power house.

Bellaire, Ohio—The Wargo Coal Co. has been incorporated with a capital of $1000 to mine and sell coal. The incorporators are John W. Gibbs, R. E. Althar, Nelle Fry, Bessie Evans and Norma Boyce.

Nashville, Tenn.—The Nashville, Chattanooga & St. Louis Ry. is planning for the construction of a new automatic coaling station at its local yards. H. McDonald is chief engineer for the company.

Cleveland, Ohio—The McComb Coal Co. has been incorporated with a capital of $400,000 to mine and sell coal. The incorporators are E. A. Foote, E. S. Cock, F. S. McGowan, S. Chestnutt and J. K. Lee.

Akron, Ohio—The D. L. Wilson Coal Co. has been incorporated with a capital of $1000 to mine and sell coal. The incorporators are D. L. Wilson, D. M. Yarger, D. M. Turner, E. L. Siegel and H. L. Foratbauer.

Lorain, Ohio—The John Stack Coal Co. has been incorporated with a capital of $15,000 to mine and sell coal. The incorporators are George L. Glitsch, J. E. Stack, Gerald T. Stack, S. J. Stack and L. C. Roth.

Cleveland, Ohio—The Lake Erie Coal Co. has been incorporated with a capital of $1000 to mine and sell coal. The incorporators are George D. Rowland, F. G. Danielson, D. A. Elkins, M. Nichols and W. J. Budd.

Monterey, Tenn.—The Briar Hill Collieries are developing a new 1500-ton mine, and have awarded a contract to the Roberts & Schaefer Co., engineers and contractors, Chicago, for the building of a new modern Marcus tipple.

Rose Bud, Penn.—The Irvona Coal & Coke Co. has awarded a contract to the Roberts & Schaefer Co., engineers and contractors, Chicago, for a complete wood tipple, equipped with Marcus screens, car haul and other machinery.

Cincinnati, Ohio—The Hermitage Coal and Supply Co. has been incorporated with a capital of $5000 to deal in coal. The incorporators are C. W. Stricker, Robert Wirth, M. F. Little, L. M. McGlaughlin and George G. McGlaughlin.

Henryetta, Okla.—The Fretwell Coal Co. has been organized here and chartered for business in Oklahoma. The capital stock is $10,000 and the incorporators are R. R. Fretwell, J. E. Whitenton and R. B. F. Hummer, all of Henryetta.

Birmingham, Ala.—The Montevalle Hard Coal Co. filed articles of incorporation in Jefferson County recently. Thomas L. Hendrix is president and Samuel G. Grey secretary-treasurer. The capital of the new company is given at $4000.

Louisville, Ky.—A resolution in the City Council authorizes the Louisville city buyer hereafter to make coal purchases direct from mines in amounts up to $2000 at a time, instead of having to advertise for bids and award to the low bidder.

Nashville, Tenn.—Impassable streets have resulted in a request from the local fuel administrator, John H. DeWitt, that consumers absolutely in need borrow or purchase from their neighbors or go themselves to coal yards for their supplies.

Hamlin, Va.—The Hamlin Coal Co., recently organized, has leased a large tract of local coal lands and is planning for the immediate construction of a new tipple and 15 miners' residences to inaugurate operations. R. R. Williams is president.

Baltimore, Md.—Fire recently destroyed a portion of the coal-thawing plant of the Baltimore & Ohio R.R. on Curtis Bay Pier, with loss estimated at $75,000. It is said the destroyed portion will be immediately rebuilt. H. A. Lane is chief engineer.

Roanoke, Va.—The Russell Fork Coal Mining Co. has been incorporated with a capital of $500,000 to engage in a general coal-mining business. R. C. Forbes, Lynchburg, is president, and W. H. Partain, Jr., Baltimore, Md., is secretary-treasurer.

Spokane, Wash.—The Miller & Colianni Co. of St. Paul, Minn., has been awarded the contract by the Northern Pacific Railway Co. to supply the engines of that company's lines with coal from Paradise, Mont., to the coast. This includes twenty stations.

Birmingham, Ala.—The W. C. Rust Coal Co. has been incorporated with a capital stock of $10,000. W. C. Rust is president, J. F. Berry Baugh, vice president and treasurer, and Anna M. Rust, secretary. The headquarters of the company will be in Birmingham.

Nashville, Tenn.—According to a report of Chief Mine Inspector Shiflett, of Tennessee, there were 184 coal mines in operation in Tennessee in 1917, compared with 126 the year before. The 1916 production was about 6,000,000 tons and the 1917 production 7,500,000 tons.

Columbus, Ohio—Columbus is to have a municipal coal yard after all, unless a referendum is called to defeat the ordinance passed by the city council over the mayor's veto. So far no attempt has been made to have the referendum and the coal yard will be established within 30 days.

St. Louis, Mo.—The St. Louis Chamber of Commerce has appointed the following to represent the coal interests in the members' conference of the organization: Parker H. Woods, chairman; P. E. Conrades, vice chairman; Edward Devoy, E. C. Donk and John C. Muckermann.

Irvington, N. J.—The International Coal Products Corporation has been incorporated, with a capital of $11,000,000, to engage in the development of inventions for the manufacture of smokeless fuel. The incorporators are C. L. Blair, George W. Bacon and John B. Dennis, all of New York.

Auburn, Ill.—The Panther Creek Mines, Inc., near Auburn, Ill., in which the Solomon Brothers, of Springfield, Ill., are interested, are sinking a new shaft for the development of a 4000-ton mine, and have awarded a contract to the Roberts & Schaefer Co., engineers and contractors, Chicago, for the building of a new tipple.

Greenville, Ky.—Suit has been filed by the Central Trust Co., Owensboro, Ky., as trustee for a number of bondholders, against the Continental Fuel Co., seeking to enforce a mortgage of $125,000 on mining property known as the Diamond Block Coal Co. and other properties near Drakesboro, in Muhlenberg County.

Cincinnati, Ohio—John H. Dierkes is president of the Phœnix-Jellico Coal Co., incorporated with a capital stock of $65,000, to succeed the Phœnix-Jellico Coal Co., of Kentucky, which formerly operated a mine near London, Ky. The mine has now been leased by the company to the Horseshoe Coal Co., which is operating it on a royalty basis.

Galloway, Ohio—At a meeting of the stockholders of the Simpson Creek Coal Co., it was announced that two new mines have been opened in the Fairmont region. Coal is now being taken from 14 openings on the property of the company, which consists of 3500 acres. The combined capacity of the mines will amount to about 8000 tons daily.

St. Louis, Mo.—The fourth annual banquet and entertainment of the St. Louis Coal Club was given Monday night at the American Annex. John P. Reese, vice president and general manager of the Superior Coal Co., was the principal speaker. His subject was "The Relation of Government-Controlled Railroads to the Coal Industry."

Indianapolis, Ind.—A large service flag, bearing 19,135 stars, was unfurled at the twenty-sixth consecutive and third biennial convention of the United Mine Workers, held on Jan. 15. The flag measures 48 x 75 ft., and required 400 yd. of material in its manufacture. Each star represents a union coal miner who is now in any branch of the Federal service.

The Federal Fuel Administrator for Texas—Wiley Blair, of Dallas—issued an order directing the Lone Star Gas Co. to cut off all industrial users in Dallas, Fort Worth, Denison, Sherman, McKinney, Denton, Gainesville, Wichita Falls and Abilene so that the gas supply might be conserved for domestic uses. This step was taken as an emergency measure to conserve the fuel.

Columbus, Ohio—Governor Cox has appealed to Railroad Director McAdoo to take off passenger trains in Ohio in order to get motive power for the movement of coal trains. He claims that many passenger trains in the "Buckeye State" can be taken off without great inconvenience. Reports show that upward of 5000 loaded cars of coal on several railroads in Ohio remain to be moved.

Panama, Okla.—The Stewart Coal and Mining Co. has been organized here with a capital of $10,000, and charter has been filed in the office of the Secretary of State at Oklahoma City. The incorporators are Pete Stewart, Jr., Mrs. Lula Stewart, both of Hartford, Ark., and Thomas Murphy, of Panama. The company will develop coal lands in eastern Oklahoma and western Arkansas.

New Philadelphia, Ohio—The Reeves Manufacturing Co., Canal Dover, has had plans prepared for the construction of a new tipple, 40 ft. high, to be equipped with a 5-ton motor, 60 to 75 coal carrying cars, industrial trackage, transformers, and special mining machinery, for the immediate development of its coal properties. George Arnold, Broadway Ave., New Philadelphia, is the architect.

Cambridge, Ohio—The Akron Coal Co. is opening a shaft mine on the Baltimore & Ohio R.R., seven miles east of Cambridge. The shaft, which is 187 ft. deep, is about completed and the work of installing machinery has started. It is planned to have a daily output of from 1200 to 1500 tons. The shaft reaches No. 7 seam, which is about 5 ft. thick. The company controls a large acreage in that section.

New York, N. Y.—The Hoisting Engine Sales Co., formerly operated by William B. Cist as sole proprietor, has been incorporated in the State of New York under the trade name of the Hoisting Engine Sales Co., Inc., and at a meeting of the directors, the following officers were elected: William B. Cist, president; Archer Armstrong, vice president and general manager; H. Haaman, secretary and treasurer.

Wilsall, Mont.—The Bender Coal Co. has been organized by Frank Bender and Samuel Barrett, of Livingstone, and John Fodness, of Chico, to develop the Edgar Potter coal measures in the Potter Basin field, 12 miles north of here. About Jan. 30 a contract will be let to sink a permanent slope. At present a temporary opening has produced 250 tons of coal, which has been used

by local industries with entirely satisfactory results.

Millfield, Ohio—The North Hill Coal Co. is opening a new mine on Bailey Run near Chauncey, Athens County, Ohio. The mine is located on the Kanawha & Michigan R.R. It will be a shaft mine to No. 7 seam which is about 4 ft. thick. The shaft will be about 40 ft. deep. The mine will be equipped with electrical machinery, the power to be secured from the Hocking Power Co., at Floodwood. The company has 200 acres at that point.

Kansas City, Mo.—Fuel administrators of Kansas, Missouri, Arkansas, Oklahoma, Nebraska and Iowa, in conference here on Jan. 21, suggested that no district representatives be appointed this late in the season in this territory or the territory supplying these states with coal. Breweries in Missouri closed Monday and Tuesday, and these are the only manufacturing industries restricted by any of the above administrators.

Cincinnati, Ohio—Warrants are being issued from the United States District Court at Covington, Ky., against coal operators in eastern Kentucky who are charged with violations of the executive order fixing prices for coal at the mines. Cases where prices were higher than those fixed have been carefully recorded, and it is declared to be the intention of the Federal authorities to cause arrests and prosecutions without further delay.

Louisville, Ky.—In recognition of the handicap represented by the two feet or more of snow on the Louisville streets, the local fuel committee has ordered an addition of 50c. a ton to the retail price of coal delivered in Louisville. Snow has practically paralyzed local traffic in Louisville, and off the street car lines transportation has been practically impossible. Four horses are required off the street car lines to pull a ton of coal.

Manchester, Ohio—C. R. Dailey, formerly a fur buyer at Canal Fulton, has embarked in a coal business in Summit County near Manchester. He has secured 35 acres of excellent No. 1 Massillon seam coal and a shaft 96 ft. deep is now being sunk. The output will be hauled to Akron by motor trucks. It will be a pick-mining proposition, and it is expected the daily output will be about 300 tons. The machinery and equipment will cost in the neighborhood of $50,000.

Greentown, Ohio—The Greentown Coal Co., of Massillon, Ohio, is rapidly equipping a mine near Greentown where a shaft 40 ft. deep is being sunk to No. 4 seam. The company has 300 acres under lease. The seam is 5 or 6 ft. in thickness. The company will depend on local trade to take care of the output until such time as the coal-cutting machinery is installed. It is expected to have an output of 300 tons daily. L. P. Schimke is manager of the company.

Pineville, Ky.—The Williams Byproduct Coal Co., recently organized, is planning for the immediate development of about 2000 acres of coal land, consisting of 1300 acres of Harlan and Creech seams and 700 acres of Wallins seam. Machinery is being installed in its plant, which will include electrically operated equipment. J. W. Williams, Gorton, is president; H. H. Asher, vice president, and G. M. Asher, all of Pineville, is secretary-treasurer. The company is planning for a daily capacity of about 2000 tons.

New York, N. Y.—At the annual meeting of the Wholesale Coal Trade Association of New York, held at the Whitehall Club on Jan. 17, the following directors were chosen: W. S. Alden, R. H. Burrows, W. R. Coyle, George M. Dexter, Thomas Dickson, C. C. Harris, James A. Hill, W. A. Marshall and LeBaron S. Willard. The board of directors the following day elected the following officers: President, James A. Hill; vice president, George M. Dexter; treasurer, C. C. Harris. Charles S. Allen is the secretary.

Dallas, Tex.—Severe coal shortage has been experienced in Dallas and other Texas cities during the blizzard just ended. In many of the smaller towns of Texas there was complete exhaustion of the coal supply and dealers were unable to supply even the emergency calls to relieve suffering. In Dallas, however, the situation was better, the dealers at all times retaining sufficient supply for all emergency calls, although they limited deliveries to the needy cases and delivered only such amounts as would relieve the situation.

Scranton, Penn.—At the annual meeting of the Scranton Steam Pump Co., on Jan. 18, Lester Davis was elected president, succeeding S. E. Dolph, who is now in the United States Army. Mr. Davis, who was formerly general manager of the company, will still continue in that capacity. The last year was the most prosperous in the history of the concern, the shipments for the year reaching a total of $800,000 in value. Orders on hand indicate that the Scranton Steam Pump Co. will enjoy continued prosperity for a long time.

Charleston, W. Va.—The Davis Creek & Spring Hill Railway Co. has been incorporated with a capital stock of $50,000, for the purpose of building a three-mile line of railway from a point near Spring Hill to a point near the Middle Fork of Davis Creek, for the purpose of opening up the nearest coal field to the proposed Government armor plate and munition factory to be located at South Charleston. Work will begin at once. R. N. Snyder, Samuel Edwards, H. F. Smith and E. M. Surber, all of Charleston, are interested.

St. Louis, Mo.—Retail coal merchants of Missouri met here a few days ago and organized a state association and elected these officers: President, P. T. Bryan, Kansas City; vice president, I. C. Knotts, St. Joseph; secretary and treasurer, E. J. Wallace, St. Louis. The state was divided into these nine districts: St. Louis, St. Joseph, Kansas City, Springfield, Joplin, Hannibal, Cape Girardeau, Jefferson City and Sedalia. Each district will have three directors. The St. Louis directors are: Walter F. Heinrich, J. J. Connell and Oscar Stephan.

Buffalo, N. Y.—The Corson Byproduct Coal Corporation of this city has elected the following officers: President, George A. Corson; vice president, A. A. Engle; secretary and treasurer, John E. Selkirk, all of Buffalo. The directors chosen were the officers, E. C. Roberts, of Buffalo, G. B. Stephens, of Lancaster; G. J. Brendel, of Hamburg, and H. J. G. Heiser, of Orchard Park, all this county. The company's property is in the Elkhorn district of Kentucky. Development has about reached the shipping point. The coal goes south, or to the Chicago district.

Louisville, Ky.—One of the principal difficulties under which operators have been working since the arrival of the severe weather has been that of the water supply. Ordinarily Kentucky mining operations do not encounter near-zero temperatures and rely on shallow lakes and streams for water for their power plants. Now, however, with near-zero temperatures a fact for weeks, many mining operations have found their sources of supply frozen up. Tank cars have had to be resorted to to keep water enough on hand for steam-making purposes and some operations have had to shut down altogether.

Columbus, Ohio—Because of car shortage and transportation difficulties occasioned by lack of motive power, and the blizzard, the production of coal in various mining districts of Ohio has been down to a low ebb. This is shown by a report for the week issued by W. D. McKinney, commissioner of the Southern Ohio Coal Exchange, and J. B. Zerbe, secretary of the Eastern Ohio Operators' Association. The report shows that out of 65 mines in the southern Ohio field and 85 mines in the eastern Ohio field reporting, the loss in production was 238,809 tons. Taking mines not reporting, the loss is considerably over 500,000 tons.

St. Louis, Mo.—Operators of the Fifth and Ninth Illinois districts, at a meeting here, unanimously indorsed plans submitted by Missouri Fuel Administrator Crossley for the establishment of a fuel district composed of Missouri, Kansas, Nebraska, Oklahoma and Arkansas, to be supplied with the output of the Illinois mines contiguous to St. Louis. The desire is to give the district preferential jurisdiction over the output of the mines from which it naturally draws its supply. The proposition also received the indorsement of the newly organized Retail Coal Merchant's Association of Missouri. Resolutions will be forwarded to Administrator Garfield.

Gallipolis, Ohio—The unprecedented freeze on the Ohio River, which now covers the river from Pittsburgh to Cairo, virtually its entire navigable length, is causing much damage to shipping in the stream, besides closing entirely the movement of coal. Many vessels belonging to coal companies have been carried by the ice from the Great Kanawha into the Ohio, and are threatened with destruction, many loaded barges of coal, including twelve in tow of the Campbell Creek Coal Co.'s towboat "Robert P. Gillian," being in this condition. The Kanawha fleet thus caught in the Ohio ice near Dam 26, with crushing or sinking by the ice imminent, is valued at $500,000.

Cincinnati, Ohio—Roger W. Babson, the famous statistician and business expert, in an address before the Cincinnati Rotary Club at the Hotel Sinton, declared that the coal shortage is due to the low prices fixed by the Government last summer, which made it impossible for hundreds of small mines to operate at a profit, and thus forced them to close, reducing the possible maximum output very heavily. Mr. Babson declared that price-fixing by the Government has always been a failure, and always would be, especially in the coal trade, suggesting that the incentive of profitable prices, produced by a free market under competitive conditions, has proved to be the best means of securing a large production of coal.

Frankfort, Ky.—One of the new measures introduced in the Kentucky Legislature now in session is House Bill No. 83, which would place a production tax of 1 per cent. on coal mined in Kentucky, and also permit counties to levy production taxes of ½ of 1 per cent., both to be figured on the market values at points of production. Another measure, House Bill No. 61, would affect some mining corporations since it seeks to require that concerns issuing script to employees redeem this script for cash on regular paydays. The Kentucky coal operators are represented at the capital. One lobbyist suggested that in view of the likelihood that the Government would take over the coal properties the efforts to assess tonnage taxes would likely be in vain.

Charleston, W. Va.—The supply of cars throughout the Kanawha district during the past month has averaged less than 35 per cent., according to estimates based on reports from various operators. The car shortage has been especially severe on the Chesapeake & Ohio, on account of the inability of the railroad to move loaded cars to clear the tracks for the return of empties. Figures for the past week indicating the situation as to cars are as follows: Jan 10, out of 166 mines, 80 were without cars; Jan. 11, of 168 mines, 93 were idle; Jan. 12, out of 170 mines, 90 were idle; Jan 14, 160 mines reporting, 58 were idle; Jan. 15, 156 mines reporting, 91 were idle. The loss of coal production caused by this extensive idleness forced by lack of cars is obviously enormous.

Cincinnati, Ohio—Through a successful appeal to Director General of Railways W. G. McAdoo, by the Hamilton County fuel administration committee, the movement of several hundred cars of coal from the congested yards of the Chesapeake & Ohio Railway Co. at Silver Grove was obtained early last week, enabling the relief of some of the distress among all classes of consumers. It is stated that more than 1500 cars of coal have been lying at Silver Grove for some time, within a few miles of Cincinnati and Covington, both of which cities are suffering for want of fuel, due to the inability of the railroads to move the cars. The coal received through the intervention of the Director General of Railways was distributed under the direction of the local fuel administration committee.

Cincinnati, Ohio—Small amounts of coal secured by the city from various sources, including donations from manufacturers, were distributed to the public in bushel lots at 24 stations established for the purpose at various points of the city. According to C. R. Hebble, of the Hamilton County fuel administration committee, the coal situation in Cincinnati is the most serious in the city's history, failure of relief by the receipt of an adequate amount of coal to supply domestic consumers being the cause. Seizure of coal for domestic consumers from factories with a supply on hand was threatened, but the suspension of industrial activity will, it is hoped, make this unnecessary. Dealers with a small quantity of coal on hand distributed it in one-bushel lots to hundreds of applicants.

Cincinnati, Ohio—Members of the Hazard Coal Operators' Exchange, of Hazard, Ky., held their annual meeting on Jan. 12 at the Hotel Gibson, holding the election of officers for 1918, with the following results: President, George H. Barker, of the Maynard Coal Co., Columbus; vice president, G. G. Bowain, of the Daniel Boone Coal Co., Hazard, Ky.; secretary and treasurer, R. A. Hord, Hazard, Ky. Executive committee: E. L. Douglas, of the Hazard-Jellico Coal Co.; A. L. Allais, of the Columbus Mining Co.; H. K. English, of the Blue Grass Coal Corporation, and Hugh Buford, of the Ashless Coal Corporation. The business sessions of the meeting were devoted almost entirely to discussions of how to solve transportation difficulties, with special reference to the problems of getting coal to domestic consumers and Government supply factories. The members did not anticipate the suspension of industrial operations for a period, but discussed only the possible methods of improving conditions as they were at the time.

MARKET DEPARTMENT

GENERAL REVIEW

The order of the Fuel Administrator closing down industry on certain days has been carefully observed. The beneficial effects of this order has been largely nullified by adverse weather conditions.

The event of possibly the greatest importance to the fuel industry since the fixing of prices last August occurred last week when Fuel Administrator Garfield notified the country that for five days certain restrictions were placed upon the industrial consumption of fuel and for each succeeding Monday up to and including Mar. 25. This order came so suddenly as to greatly surprise and shock the fuel industry of the country in general. From all sides wild dissension and severe criticisms were heard, while the members of Congress were deluged with communications from their constituents. The order was, however, obeyed with a promptness and exactitude that clearly portrayed the temper of the American people. Unfortunately for the coal industry, the transportation system and the country at large, another cold wave descended upon the Middle West during the latter part of the week. This was in many localities accompanied by snow, more or less heavy, and by high winds. This resulted in conditions embarrasing for the transportation companies. Some mines have been so hampered by weather conditions that they have not worked for 10 days to two weeks; others have been able to limp along, most of the time with small outputs, short labor and inadequate car supplies. The weather probably played the greatest havoc with the mining industry in Illinois, where the snow in some places is said to be drifted four or five feet deep. The cold, however, exerted an adverse effect throughout the entire country, showing adversely in both production and distribution. Throughout the East where the greatest traffic congestion existed, and which therefore should be benefited more by the five-day shutdown than other section of the country, the improvement so far as can be learned has not been marked where railroad yards and sidetracks are concerned. On the other hand, the bunkering of ships has gone on steadily, and many of the steamers lying at New York and other harbors awaiting coal supplies have doubtless been furnished with their necessary fuel requirements. The dispatch of these vessels will do much to relieve freight terminal congestion, which is quite as marked as the congestion in railway yards and on sidetracks. This relief, of course, will not be immediate, but should take effect with the return of these vessels for cargoes. So far as New England is concerned, the conditions are believed to be slightly less stringent than they were a week or so ago. Congestion at various railroad yards outside New England is doing much to impede the supply all-rail to that territory. It is to be hoped that this congestion may be relieved. New England is also receiving greater supplies by water than it was a week or two ago. The conditions in New York so far as distribution is concerned are probably as bad, if not worse, than they have been at any time in the past few months. It is thought by some that no material relief will be felt until mild weather renders the shipment of coal from the Jersey shore more safe and easy. Difficulty is also being experienced at the present time in securing adequate help at the various loading points where cars are discharged into lighters and barges. It seems to be the consensus of opinion throughout the entire country that little general material relief may be expected until warmer weather.

A Year Ago—Anthracite demand less urgent though still very firm. Railroad embargoes create a spotty condition in the bituminous trade. High level on contract prices. Acute shortage at the Lake cities. Conditions much improved in the Middle West.

COAL PRODUCTION

The return of severe weather at the close of the week ended Jan. 12 caused the average production of soft coal per working day to fall to 1,735,023 tons, the lowest mark since the week of Dec. 22. Because of the six working days, the total production was 1,034,000 tons greater than in the five working days of New Year's week. The total production of beehive coke is estimated at 586,628 net tons for the week ended Jan. 12, an average per working day of 97,771 tons. Anthracite shipments, as reported by the nine carriers, amounted to 35,720 cars. This, although an improvement over the production during the holiday season, is still far short of the average maintained in November and the first week of December, before the coming of severe winter weather.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Dec. 22	Dec. 29	Jan. 5	Jan. 12
Bituminous shipments, 114 roads	177,599	158,596	168,936*	185,039†
Anthracite shipments, 9 roads	36,083	29,47o	25,604*	35,720†
Beehive coke shipments, 4 roads	11,835	10,211	9,348*	12,043†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

Bradstreets—Willingness to do business on a large scale has been restricted by heavy snowstorms in the West, by intense congestion in railway facilities, which has made it well-nigh impossible to ship fuel or other supplies, and finally the Fuel Administrator's order closing plants for five days and every Monday for ten weeks, has thrown vast numbers out of employment. Under the circumstances it is obvious that the week has been marked by considerable unsettlement, but after the first shock it is quite generally recognized that the Fuel Administrator's order, while drastic, was imperatively necessary, and the general tendency is one of patriotic obedience to the mandates of the order.

The Dry Goods Economist—The order of Fuel Arministrator Garfield, forbidding the use of coal in factories, stores, etc., during five days and on each Monday up to Mar. 25, will have a tremendous effect on the production and movement of merchandise. It is impossible at this writing to figure the effect of such a radical and unprecedented move.

American Wool and Cotton Reporter—Trading in the local wool market continues moderate. The future course of affairs depends naturally upon what the Government intends to do next.

Marshall Field & Co.—Despite adverse weather conditions current shipments of dry-goods for the week have been about equal to the heavy week of a year ago. Road sales for both immediate and future deliveries have been greatly in advance of the same period in 1917. The number of customers in the market has been somewhat reduced by weather conditions. The market on domestic cotton continues strong. Collections are good.

Atlantic Seaboard

BOSTON

Fuel-saving regulations much criticized, but many industrial plants were bound to close within a short time. Sufficient supply reaches New England to tide over the more vital needs, but situation still desperate. Railroads in particularly bad shape. Anthracite short. From present outlook large number of manufacturing plants must run on much reduced time.

The outlook for fuel is now sufficiently realized in New England so that manufacturers and other large consumers who are not classified among the necessary activities are getting reconciled to the inconvenience. Criticism of the "5-day order" is widespread, but each day sees the need of drastic measures better understood, and if no more is accomplished than the clearing-up of traffic in the area about the New Jersey terminals and the despatch of oversea transports that have been held up waiting for bunker coal it will have a large item to its credit. No one in touch with the general state of coal traffic believes there will be much relief while winter weather prevails.

The shut-down order is being faithfully observed, although the number of exemptions throughout this territory is large. The various rulings have been interpreted in a broad-minded way, yet consistent with the saving of fuel, and the hardship is not as great as people feared. Local train service has been further cut down. Many large manufacturing plants have also curtailed their hours during working days, and the order to close was in a sense prepared for because the time was near at hand when they would have had to cease operations anyway through lack of fuel. One group of woolen mills under one management uses 65,000 tons a month, and the Boston and Maine R.R. finds itself with no supply on hand beyond Feb. 1. When such instances are multiplied it can be seen how desperate is the plight of consumers in this part of the country.

Coastwise movement has been resumed, although ice and other adverse conditions still interfere with loading despatch. The number of bottoms waiting at Hampton Roads has been reduced from 110 to something over 90, and the receipts at this end are so relatively small that only the most vital activities such as railroads and other utilities can hope to continue operation for the present. The Maine Central R.R. at this writing has only a few days' fuel, even after coal has been diverted from other railroads.

Industries like the Victory Destroyer Plant at Squantum, Mass., and the Bethlehem Shipbuilding Co. are in most serious need, and the few emergency cargoes coming through the Fuel Administration are able to meet requirements only in a most restricted sense. The "Achilles," a Panama collier of 12,600 tons, is delivering on her second trip to New England, having brought this time West Virginia high volatile for distribution to points in every New England state but Connecticut, and not an industrial plant among the consignees. The coal is going to railroads, hospitals, pumping stations, and to retail dealers for heating purposes. Retail dealers in several of the New England ports have practically confessed their inability to cope with local conditions and are looking to the fuel authorities for help.

The "New England order" of Jan. 3 for 500 cars daily all-rail from certain designated mines has so far been about 50 per cent efficient. Operators complain that 'other priorities" must be looked out for first and the blizzard a week ago seriously affected the railroads in placing cars.

The congestion on some of the lines in the mining region is something tremendous. Divisions that ought not to have to move more than 2000 loaded coal cars per day have 10,000 on their tracks, and the average daily haul is down to 12 and 14 miles. So large a proportion of what is loaded on the "New England order" is for railroad fuel that only the most pressing cases of shortage among power companies, water systems, etc., can be dealt with. Some of the operators take the position that the Garfield order of Jan. 16 is virtually a cancellation of the "New England order," even though the consignments under the terms of the latter are clearly under the classifications entitled to preferential shipment.

So far not much coal has been commandeered by state administrators under the powers granted. Tonnage, however, is being increasingly applied to distribution for apartment house and other dwelling house uses, in the effort to relieve actual suffering. In the cities all the reserves are fast eaten up. Storage piles that were accumulated for the navy and other Government uses have been subject to heavy inroads the past fortnight to take care of emergency needs of various necessary public functions. Schools, for instance, are not considered among these, although there is probably more criticism directed to the failure of public schools to open than to any other one phase of this complex situation.

The congestion at Maybrook, N. Y., one of the chief New England gateways, is unparalleled. It is reported that more than 4000 loaded coal cars are backed up beyond this transfer point, and the outlook for relieving the New England situation is not bright. Harlem River is in somewhat better shape, but cars are again beginning to accumulate at West Albany Transfer and

the Boston & Maine gateways. This situation, in addition to the breakdown on the Pennsylvania, gives real cause for alarm. It is, in fact, a real problem to keep supplied the needs of railroads and other vital activities. A large number of plants working 100 per cent. on Government orders are being passed over because other requirements are more urgent. One operator who complained of the multiplicity of "priorities" was able the other day to show six different classifications ahead of his regular commercial orders.

As a sidelight on the situation at some of the smaller ports along the coast, it is interesting to note that a 3500-ton barge is now discharging at the Boston & Maine dock, Boston, the entire cargo of which is to be railed to Lynn to supply the waterworks, gas and electric-light plants, and for heating purposes among householders who are without fuel of any kind.

NEW YORK

New York City situation acute. Retail dealers' supplies low with ice hampering deliveries. Conservation order supported by the trade and public. Fuel authorities strive to relieve the situation. Bunker coal moving steadily and waiting vessels get supplies. Car supplies slow and many mines are idle.

Anthracite—Dr. Garfield's conservation order was only one of several important developments in the New York market. The Board of Aldermen by adopting an ordinance has given Mayor Hylan the power to confiscate any surplus coal owned by either individual or corporation, the price to be paid the owner by the city to be fixed by the Supreme Court. One of the largest retail dealers in Brooklyn found he was up against labor troubles when he had plenty of coal for at least one day's deliveries. The matter which involved increased wages for the drivers has been submitted to arbitration.

While the conservation order has no doubt benefited other parts of the country it has not offered much encouragement to the New York public. Even with, according to reports, a few hundred thousand tons of coal in cars at the railroad docks across the river and bay New Yorkers found little satisfaction because it was not possible to dump it into barges. Furthermore, the ice continues to hamper navigation. Several thousand tons of coal are resting at the bottom of the rivers owing to the heavy ice smashing in the sides of the barges. Much of this, it is expected, will be salvaged later in the season.

The order issued by Dr. Garfield created a lot of dissatisfaction among the trade but the dealers and public did their best to uphold it. Every public institution and industrial plant not exempted by its provisions obeyed the order and many thousand tons of coal were saved from consumption. However, the householders were as insistent as ever and at the end of the five coalless days there was no more coal left in the dealers' yards than there was before the order went into effect.

There were upwards of 1,200,000 persons thrown out of work in the Metropolitan district during the five days and about 800,000 more in New York State. Of this vast number it was estimated there were 700,000 persons out of work in Manhattan alone and that the loss of wages will run into the millions of dollars. It was estimated that the amount of capital involved was around $2,633,936,052.

The trade as a rule, was not willing to talk about the order. One man when asked what he thought of it replied "I have been talking until I am black in the face. Now, let others do the talking." Some dealers thought the order too drastic and unnecessary but the majority blamed the railroads for not moving the cars. If that had been done they said, there would not be any shortage of fuel.

An offer of the railroads to employ any of the men thrown idle as a result of the conservation order resulted in a very small percentage reporting for work.

Dealers complained of slow deliveries and then to add to their troubles some of the towing companies it was reported notified their customers of increases in towing charges.

Production has not been at its maximum because of severe snow storms in the mining regions. Transportation was delayed until the mine workers assisted the railroad men in removing the ice and snow from the tracks.

The gas companies continue to do a maximum business and their subsidiaries find a ready market for all the coke they offer for sale.

In their efforts to have Dr. Garfield's conservation order fully obeyed the Fuel Administrators were assisted by the police department and by a corps of deputies from the office of the United States Marshal. Many complaints were sent to the Fuel Administrators' offices but most of them were due to ignorance of the law. The administrators were swamped with applications for exemptions the first few days after the issuance of the order but only 135 requests were granted up to Saturday night.

Fuel conditions in the school houses have not improved and it has been decided that the buildings now closed will not be reopened until Feb. 4, the start of the new school term. Many of the churches have closed their main auditoriums while others have been closed entirely, joining with other churches of the same denominations in services until the situation improves.

Many schemes are being presented to prevent a repetition of the present situation. One civic organization suggests the reopening of the old Delaware & Hudson Canal from Honesdale to Rondout on the Hudson.

The wholesale trade is not hopeful and does not look for much improvement until warmer weather is here. Very few have any supplies and all of them are heavily booked ahead.

The anthracite steam sizes continue to move steadily and the dealers had an opportunity to fill many bins in the lower part of the city as a result of the orders of Dr. Garfield. All of the sizes are scarce none of the dealers having any surplus.

Retail dealers, as a rule, see no better conditions ahead. Several yards are empty and might as well be closed entirely so far as deliveries are concerned. The Bronx with its 700,000 inhabitants is in a serious condition. On Saturday last there was no coal in any of the yards.

After a series of conferences between the city officials and the Fuel Administration authorities Mayor Hylan has announced that prices have been fixed for the dealers, the peddlers who operate the small wagons and the hucksters who conduct the cellar coal business.

Current quotations, per gross tons, f.o.b. Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck	4.30@5.00	5.50@6.00
Rice	3.75@3.95	4.50@5.00
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	.....

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—Not much encouragement is seen in the bituminous situation. While receipts at this Tidewater have increased the greater part of the tonnage made available for local consumption has been devoted to relieving the shipping situation, the seriousness of which is said to be one of the principal reasons for the issuance of Dr. Garfield's order for five coalless days.

The reports of J. W. Searles, of the Tidewater Coal Exchange, and of J. E. Parsons, of the U. S. Shipping Board, show that the number of vessels waiting for bunker coal in this harbor is being gradually reduced. However, there were over 100 vessels anchored here early this week because of the lack of bunker supplies.

Owners of the plants closed as a result of the Fuel Administrator's order have been asked by the local Central Federated Union to pay the wages of their employees during the suspension, and a letter has been sent to Samuel Gompers protesting against the action of the U. S. Steel Corporation in refusing to pay the wages of those employees who did not work during the five days suspension. It is estimated that not more than one-half of the men employed in the plants affected by the order will receive their pay for the idle time.

Operators here see a ray of hope in the announcement contained in one of the local newspapers that a new mine price of $3.50 will probably be fixed shortly. Nothing official has, however, come from the Washington authorities.

The pooling of barges and lighters in this harbor is expected to facilitate deliveries, as will the proposal to increase the demurrage rate for barges.

A slight relief in the situation may be expected now that all English ships arriving carry with them sufficient coal for the return journey.

The problem of providing coal for apartment houses is still serious. Most places are running on a day's supply with no surplus in the bins, and the owners are frequently taken to court by their tenants for failure to provide heat. Real estate brokers say that the present coal shortage has had the effect of increasing inquiry for private houses by occupants of apartment houses who formerly lived in private houses.

Production does not show much increase because of the car shortage.

The observance of Dr. Garfield's heatless day on Monday was carried out splendidly in New York, according to the local fuel administrators. Only 25 violations of the order were reported.

Joseph E. Parsons, who is in charge of the bunkering of the ships in the harbor, has received orders to commandeer all the barges, tugs and lighters necessary for that work.

State Fuel Administrator Wiggin at the conclusion of a conference held late on Monday telegraphed Dr. Garfield urging speed in coal deliveries to New York and recommended the pooling of all anthracite, the same as is now done with bituminous; and the reduction of anthracite sizes to four instead of eight as follows: that grate and egg be considered as one size; stove and nut as one size; pea and buckwheat as one size, and rice and barley as one size. He also recommended that the docks be worked 24 hours steadily.

Mr. Wiggin also recommended the cancellation of the present demurrage order which was ordered for this week.

PHILADELPHIA

Anthracite trade stunned by suspension order. Later criticism calmer. Bad weather in region holds back shipments. Receipts light, with outlook unpromising. Manufactured fuel finds ready market. Companies appeal for more labor. Bituminous shippers shocked by Garfield order. Car supply unimproved. More plants closed account of fuel scarcity. Contracting dead issue.

Anthracite—The main topic of conversation in the trade is Dr. Garfield's drastic order. At first those most interested were inclined to criticize the wisdom of the ruling. This includes not only those whose plants were compelled to shut down, but many of the shippers as well. The dissatisfaction is general. One of the serious objections seems to be that even industries with coal on hand were forbidden to use it during the named periods.

Dr. Garfield is accused of overlooking many important details when framing the order. One of these which was forcibly impressed upon the retail coal dealers was the increased opportunities the enforced holiday made for the unemployed, especially in the mill districts, to obtain fuel for their homes without paying for it. Dealers in the northwestern section of the city claim that practically every car they receive has been tampered with and at least a few tons stolen, while many are delivered empty. Now they find the idle days give many hundreds more men and boys, and women too—for they have done their share—the opportunity to pilfer from the cars before they have been delivered to the yards.

While this is too small a matter to receive any recognition of the Fuel Administration, it is a serious one to the consignees, for they claim they are unable to depend on any coal until it has actually been received. Notices of shipments have ceased to cheer them because they can never be sure the coal will reach its destination.

Notwithstanding all the grumbling, Dr. Garfield's order has been generally obeyed. Many deemed it unpatriotic to raise any objections and closed their places of business without questioning the justice of the ruling. While they could at first see only what appeared to be a frightful cost, many will admit there will be some benefits. Criticism has become much calmer now that all interests have had a few days to adjust themselves to the new conditions. Many are of the opinion that the Government had a stronger motive for the closing order than could be divulged at this time, which accounts for the suddenness of the move.

One day this week it was reported there were between 800 and 1200 cars loaded with anthracite stalled within ten miles of Pottsville, which is but 93 miles from this city. The majority of the cars are destined here via the Philadelphia & Reading Ry. Railroad men attribute the real trouble to a shortage of engines. Recently there were twenty-three trains made up ready to be moved to this city when it was found there were not engines of sufficient tonnage to haul the heavy loads, and the trains were delayed from 24 to 48 hours.

The past week has been a particularly difficult one with the railroads, as they had a snow storm in the coal regions, which officials claimed was the most severe since the record storm of 1888. This was later followed by zero temperatures, and the

results of these conditions are just now beginning to be felt here. With the city's minimum needs fixed at 18,000 tons daily of domestic sizes, the receipts have not been anywhere near that on any one day, dropping to 6000 tons one day and even as low as 3000 tons on another.

The dealers are unable to maintain any stocks at all in their yards, while their offices are filled all day long with people of all conditions of life pleading for coal. In the poorer sections of the city it is not at all unusual to see crowds of people with all sorts of receptacles besieging the office for a small quantity of coal and who will not disperse even after being told that there is no coal in the yard.

No one can be found who has an optimistic view for the balance of the season. All seem resigned to the belief that they must struggle through some way for at least six weeks more, as mild weather is the only relief in sight.

The present occasion has presented an opportunity to the manufacturers of briquettes to make their product known and quite a good tonnage is being marketed. One plant in the city engaged in the manufacture of this grade of fuel is doubling its capacity, in addition to building another plant in the anthracite region. Just now any dealer who can secure briquettes has no difficulty whatever in selling them.

The steam coal trade is even more active than ever, with the independents getting $4.15 for all the buckwheat they can produce and there seems to be a general understanding among them not to ask more than this figure. Barley and rice are sold around $3.50, while culm is being sold in large tonnages at $2.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for Tide are as follows:

	Line	Tide		Line	Tide
Broken	$5 90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—The order of the Fuel Administration shutting down the industrial plants for five days came as a positive shock to the trade. The shippers were open in their denunciation of the plan. Many of them who heretofore had refrained from openly criticising the administration gave full vent to their feelings. However, after the first shock had partly worn off and exemptions were granted to the thousands of plants on war material to resume work, much of the criticism moderated and it was beginning to be felt that the order might possibly have some effect on straightening out the railroad tangle.

Up to this time the car supply has not improved in the least and of course it was not believed that any improvement would be felt thus early. Central Pennsylvania shippers continue in particularly bad straits for cars. We know of a typical mine in that district with a rating of 26 cars daily which did not have a single car for commercial loading from Dec. 20 to Jan. 28, and since that time has only had 35. On this account the working forces are badly disorganized and it would really take some time to get the number of miners up to the maximum in the event of a car supply being given between 65 and 75 per cent.

In the Fairmont district, which ships heavily to this market, one of the mining associations reported 65 per cent. of the mines idle for the entire week, representing a tonnage loss of about 225,000 tons. This association wires Washington every day giving a statement of conditions as they exist in that particular region.

Contracting continues to be a dead issue, as it is claimed under present conditions it would simply mean nothing at all to enter into a contract; certainly it would have no advantage to the producer, and would in no way insure the consumer a supply of fuel. It begins to look that with the various modifications of the fuel administration's closing order that it will actually develop into a scheme for cutting down coal supplies for the nonessential users, and the chances are that the Monday suspensions of the next ten weeks will find them the sole observers.

The trade continues to await a new price, which it still insists is absolutely necessary if the business is to continue to exist. No one now hopes for this as an event of the immediate future, but there are some stout hearts who are willing to believe that it will come like a bolt from the blue somewhat similar to the recent suspension order. While several weeks ago opinion seemed to be fixed on a $3 price, quite a number claim that the increase to be worth while must be even greater, certainly not less than $3.25.

BALTIMORE

With supplies still far short of even emergency needs the coal trade is working amid the uncertainties caused by the fuel suspension order. Many mines still closed for lack of cars to load.

Bituminous—Following the first feeling of almost paralysis in business that came from the Fuel Administration order for business suspension, the coal trade here started in to pick up broken threads and accomplish the best results. The arrival of several ships for coal cargoes for New England and South America at Curtis Bay prevented any fuel sent through for that purpose from being diverted to the local needs from cars which had hitherto been kept standing for days awaiting bottoms.

The piers at Port Covington and Locust Point began the present week almost swept clean of fuel, and receipts have been insufficient to meet even emergency demands. On the second business suspension day of the fuel order the receipts of bituminous were but 15 cars, of which ten were assigned for use of the local railway system that was threatened with shutdown for lack of fuel, and five were distributed by the local fuel administrator to domestic consumers in dire need. Retail dealers distributed this coal.

Reports from western Maryland and West Virginia were that many mines were still closed down for lack of cars. Many sections have failed to make a 50 per cent. record since the first of the year, the miners many times being given enforced holidays because the railroads could not deliver empties. The local industries here are still leading a hand-to-hand existence, but it is expected that the numerous loaded coal cars that have been on sidings for weeks between this city and the mines will now be released and will bring at least a temporary relief.

Anthracite—The hard-coal dealers here got a better supply following the suspension order than had been the case for some time. This was also largely due to final release of loaded cars from sidings of railroads. Hundreds of consumers have been unable to get any coal for domestic consumption for weeks, and the fuel administrator is still unable to give any positive assurances. The policy of delivery to homes where there are children, old people and invalids is still being adhered to by the coal men.

Lake Markets

PITTSBURGH

Some coal saving in Pittsburgh. Steel industry will not consume less coal in long run. Scarcely any river coal.

The Fuel Administration's drastic fuel saving order was followed almost immediately by a fresh spell of extremely unfavorable weather in the Pittsburgh district and coal movement has, if anything, slowed down. Every effort is being made to maintain production but conditions are altogether unsatisfactory.

A considerable quantity of coal will probably be saved in the Pittsburgh district by the five-day closing, as regards ordinary manufacturers as well as office building consumption, but it can be set down as an absolute fact that the iron and steel industry does not save a ton of coal by the closing order. This is for the reason that the production of steel has for months hinged upon the production of pig iron. There is much more steel-making capacity than there is pig-iron production to keep it employed. The result is that the pig iron accumulated during the five days' closing of steel works (except such departments as have been exempted) will as soon as possible be converted into steel just the same, and much of it will have to be remelted, with either coal or coke, whereas if used as produced much of it would be used molten or direct. The eventual result as regards the steel industry will be just as much steel production as otherwise, but with somewhat more coal used.

The Monongahela River was opened for a short time last week and a few tows and barges got through, but the river promptly froze again and the boats that had broken up the ice are now for the most part laid up for repairs. Thus Pittsburgh although in the heart of a great coal-producing district is particularly short of coal because one source of supply has been almost entirely shut off and the other source, the railroads, cannot come to the rescue with an increased supply.

The market remains nominally quotable at the set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. additional permitted to be charged in the case of sales by dealers.

BUFFALO

Fuel order shuts off all other consideration of coal affairs. Coal shippers and manufacturers in consternation. Fear that it will fall flat. Anthracite demand aggravated by cold weather.

Bituminous—The situation is no doubt the same here as elsewhere. Everybody is thrown into confusion by the fuel order and the shutting down of factories. As a rule there is no effort to evade the order, but it has been anything but easy to draw the line, either on the factories or the other concerns. A good many factories ran in part at least and some, including the big stores and office buildings, went on as usual, all of course shutting down completely on the Monday holiday. The situation might have been worse, is the mildest comment.

The state of the trade would be hard to define, except that it is demoralized, so that price quotations will have to be a merely nominal matter, made in the hope, or perhaps the expectation, that some improvement is not far away. Figures therefore remain as before, per net ton f.o.b. Buffalo:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.70	4.20
Allegheny Valley	3.60	4.10

Anthracite—The weather seems to be doing its worst to beat off all effort to meet the needs of the city consumers. The amount of coal coming in is enough to make a good showing and it would do so if the weather was not so severe. But following a December of record severity comes a January quite as cold. The temperature has not been above freezing this year and it was only so for a few hours last December. Coal disappears like dew and the natural gas supply has so nearly given out that consumers have made a rush for coal, which greatly adds to the demand.

People, some of them business men, are getting coal in baskets, after giving up the effort to get it by the ton. There will be no relief till the weather becomes much warmer. It is said that the anthracite companies are preparing to increase their shipments materially, but that will mean little to the mass of the people, unless the distribution is regulated. Everybody will take all that can be had.

DETROIT

Fuel Administrator's conservation order is generally observed in Detroit. Coal receipts reduced by weather.

Bituminous—With places of business closed, stores and windows darkened and industrial plants with a few exceptions in the case of those exempted, stilled, Detroit has been experiencing the rigors of the drastic regulation put in effect by the Federal Fuel Administration for relief of coal shortage and railroad freight congestion. For many of the citizens, the regulation meant severe hardship, because of the reduction of weekly wages and to employers the five days of inactivity, in many cases brought heavy financial loss.

There were protests on all sides and some threats of defiance of the regulation, but after the first day the tendency generally was to observe the restrictions imposed. Vexatious complications attended the efforts of managers of some of the office buildings to obey and at the same time make provision for certain classes of tenants, as physicians and surgeons, who were made exempt from the regulations.

Temperatures around and below zero prevailed in the early part of the week greatly increasing consumption of coal by household buyers, while at the same time the supply was seriously curtailed as the result of transportation troubles following the severe weather and snowstorm of Jan. 12 and later snowstorms early last week which interrupted traffic and blocked railroads in Ohio and the Pittsburgh district.

Receipts of bituminous coal for last week, handled through the Toledo gateway are reported as about 957 cars of which 300 were reported Saturday, the other 657 representing receipts from Sunday to Friday night. Almost no anthracite is arriving in Detroit at present and few of the dealers have any supply on hand.

Demand for fuel continues urgent and at the end of last week the police department, in charge of distributing for the city fuel administrator, had more than 3000 unfilled applications booked. Coal shipments headed for Detroit are reported held back at various points in Ohio by conditions created by atmospheric disturbances. From various towns of the state outside Detroit, equally serious conditions of shortage are reported to the state fuel administrator.

COLUMBUS

The sudden order to conserve fuel by ordering certain fuelless days has caused considerable uncertainty. But on the whole coal production was not affected in Ohio.

Insistent demand both from domestic and steam consumers is still the big feature of the coal trade in Ohio. Both are short of fuel and although there is little actual suffering among domestic users in central Ohio, still some instances are reported from the western and northwestern sections. The continued zero weather which has stopped a large part of railroad transportation is making matters still worse.

Retailers in Columbus have been able to supply all urgent cases. Some little surplus is ahead, but dealers generally have short stocks. The local fuel administrators have been busy investigating complaints and ordering relief. Schools and churches are now fairly well supplied for the time being. Hospitals have been looked after and the same is true of certain charitable institutions.

Public utilities are the hardest hit of the steam users. Many of that class of consumers have little surplus stocks ahead and have been compelled to curtail service. This is true of power concerns, interurban and street roads and similar corporations. Manufacturers who are making nonessentials are generally low on fuel. War plants are now being given preference after railroad fuel and domestic users are taken care of.

Production during the past week was at a low point. This was due primarily to the zero weather which tied up railroad traffic. There are many thousands of loaded coal cars in Ohio without sufficient motive power to move them. As a result of the bad traffic conditions, the production in the Hocking Valley has been about 40 per cent., of which only half was for commercial purposes, the remainder being taken for railroad fuel. Pomeroy Bend and Jackson produced a smaller percentage, a greater part of which has been taken for railroad fuel. The same conditions prevail in other producing fields.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Prepared sizes	$2.70	$3.05	$2.70
Mine run	2.45	2.70	2.45
Nut, pea and slack, coarse slack	2.20	2.45	2.20

CINCINNATI

Continued severe weather, with no improvement either in the movement of traffic or in car supply, and with demand at its peak, caused the coal trade to welcome the industrial suspension order Thursday, as the only apparent remedy.

The uninterrupted continuance of the most prolonged period of severe weather that has ever been experienced in this section brought the coal situation to its most serious stage here early last week, causing great suffering among domestic consumers who were unable to obtain fuel, and bringing about the closing of nearly all of the schools and of many factories on account of lack of coal. The Ohio River is now frozen for virtually its entire length, and is therefore no longer a means of transportation for coal. The heavy snows, repeated several times during the week, caused still further difficulties in rail movement, making it a matter of impossibility to clear up the congestion of former weeks, much less to expedite the forwarding of coal.

This combination of circumstances made the order of the Federal Fuel Administration for a five-day factory suspension and for ten Monday holidays thereafter a rather welcome indication that the railroads and the coal trade may have a chance to get things straightened out and to catch up with the situation.

Inasmuch as things were already reaching a point where a general breakdown of industry on account of the fuel shortage was imminent, it is the view of coal men and of many others that the suspension order cannot do much harm, and that, on the other hand, it may save the situation. It is said that the vigorous attacks made upon the Fuel Administration by many manufacturers on account of the order are not justified, in view of the situation, and that the coal trade, out of its experience, believes the move to be fully warranted.

The Fuel Administration is not responsible for and could not avoid the traffic congestion caused both by the extraordinary demands of industry and by the unprecedented weather which has hampered the railroads for more than a month. Estimates at the saving in the Cincinnati district by the order are that about 25,000 tons of coal will be gained by the five-day lay-off, which is really only a three-day suspension on account of the intervening Sunday and Saturday, which is a full half holiday. The ten Monday holidays, it is estimated, will enable a saving of about 5000 tons each, a total of 50,000 tons, or of 75,000 tons in all.

This saving in actual consumption is entirely aside from the great general object of the suspension, which is to permit the railroads to devote their facilities to clearing their tracks without having to handle the constant influx of shipment from factories, and to enable all of the coal produced during the interval to be placed where it is most needed. The coal trade in Cincinnati, as well as the Hamilton County Fuel Administration and business men in all lines, will do everything possible to make the suspension a success in accomplishing the objects for which it is designed.

LOUISVILLE

Kentucky trade, engulfed by flood of frantic appeals for coal, hopefully regarding efforts of Fuel Administration to bring relief. Sees no other chance for relief. Retail situation chaotic.

Drastic as the order was, the Kentucky coal trade is hopefully looking for results from the Fuel Administration's five-day suspension edict and is rather expectant that something in the way of a permanent benefit has been gained. This order enabled production at the mines to go forward with no obstacles other than those presented by unfavorable weather conditions and the handicaps experienced throughout the season. A somewhat better return of coal-carrying equipment to the producing fields was noted early in the week and the hope was widely expressed that relief had been given which would make the Kentucky producers better able hereafter to meet the demands on them.

Meanwhile there has been no diminution of the steady influx of orders to selling organizations which have long been advising even old customers of inability to serve them. Inquirers appear to consider delayed replies as indications that they may get coal and follow them up by wires urging immediate shipments. In many cases it is stated that the matter of price is of no moment and that coal at any cost is desired.

Two feet and more of snow on the level, accompanied by near-zero temperatures, have simply paralyzed local transportation all over Kentucky, where such conditions are unprecedented. Retailers more or less well supplied with coal are unable to make deliveries and householders more than a few squares from coal yards are suffering severely. Independent owners of vehicles and motor trucks are charging anywhere from $2.50 to $5 a ton to go for and deliver coal to retail consumers, who now are asking for coal and not haggling over the price.

The retail trade has resolved its business into a dumping proposition and hopes that the innovation may, after this winter, lead to discontinuance of a practice which they have long objected to. The Fuel Administrator is making plans for confiscation of coal to meet local needs and the city administration is working with the coal trade to evolve a plan by which distribution may be provided for.

Coke

CONNELLSVILLE

Fuel Administration's order does not affect coke. Movement poor on account of bad weather. Some cross movements eliminated.

The production, movement and consumption, of Connellsville coke has gone on throughout the five-day period ordered by the Fuel Administration, as these operations are not covered by the order. The blast furnaces come under the seven-day operation clause, as do the byproduct coke works while the beehive operations cannot be regarded as coal shippers.

The coke movement has been poor in the past few days. Conditions were growing ripe for an improvement when a fresh spell of practically zero weather came last Saturday night, resulting in a further slowing down of railroad operations. While some good results are expected through the breathing spell afforded the railroads by the plant-closing order, there is nothing to date, because of the bad weather.

The Carnegie Steel Co. is now operating 36 of its 59 blast furnaces, the remainder being entirely out of blast or banked awaiting supplies of coke, and this is almost the poorest operation thus far shown, the minimum having been 33 furnaces, a few weeks ago. The other steel interests are operating almost as poorly, while the merchant furnaces are not getting out more than 75 per cent. of their normal product, at the outside.

The cross movement of coke, so much investigated and complained of in the past two months, is now being eliminated to an extent. A considerable tonnage of coke from the upper end of the old basin is now being moved East instead of coming into Pittsburgh over the main line of the Pennsylvania, and the owners are being given coke from the lower region instead, largely coke originating on the Monongahela R.R. Additional exchanges are being negotiated and eventually this is going to result in better coke movement even without any increase in actual railrod facilities.

The coke market shows practically no transactions. Prices are quotable on the set basis, $6 for furnace, $7 for 72-hour foundry, selected, and $7.30 for crushed, over 1-in., per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 12 at 237,707 tons, an increase of 21,609 tons, and shipments at 290,718 tons, an increase of 75,053 tons.

Middle Western

GENERAL REVIEW

Unprecedented weather conditions cripple railroads and stop coal production.

The week just passed has been one of confusion and chaos among the coal operators and railroads. Monday last occurred one of the heaviest snowfalls that has occurred in the Middle West section for years, making it impossible for coal mines to move cars, until the snow was removed. This heavy fall of snow was accompanied by a gale from the southwest, that continued throughout the week, making it almost impossible for outside labor at coal mines to work. The result is that production has been reduced from 60 to 75 per cent. normal.

Regardless of the fact that there was but little coal to move the railroads have made but little headway in moving to destination that which the operators were able to get into cars. Reports reaching us indicate that there are cases where coal is still standing loaded at mines that has been billed for ten days, occasioned by the fact railroads have not the motive power to operate trains.

That everything having to do with coal is in a demoralized condition is apparent all over the Mid-West, except the territory west of the Mississippi River, and in this region coal is moving very slowly. Dealers everywhere have been stripped of all the coal they possessed, and in cases where a dealer was fortunate enough to have a small supply on hand deliveries to customers in most cases was impossible due to the heavy snow and the inability to get labor to handle them. Industrial plants, public utility companies which ordinarily carried an ample supply for protection have depleted their storages until reserve stocks are wiped out.

Mines, in most instances, have been clogged with snow 4 to 5 feet deep, making it impossible to move cars until this snow was removed. This could be accomplished only in part. Mines that have four tracks, one for each standard sizing of coal, in most cases have been compelled to shovel snow to the two center tracks, and discontinue the making anything but two or three sizes—steam lump, mine-run and screenings. In some instances only the loadings of mine-run was attempted. Local state and national fuel administrators have been working overtime trying to satisfy some of the clamorous demands made on them for relief. Their main efforts have been devoted to trying to keep the people warm and supply such plants as furnished lights and gas.

The result of Dr. Garfield's order closing various industries throughout this section was received in a majority of instances as a matter of necessity. Although it had been expected that some such order was necessary no one contemplated that the instructions would be so far reaching. The first day's operation found thousands of plants idle.

Many large manufacturing plants were really glad of the opportunity to suspend actual operation for a few days so that they might have a chance to make needed repairs which they had been unable to do for several months, because of an accumulation of pressing orders on hand.

Generally speaking, little opposition has been made to the putting into force of fuelless days, and violations so far have been but few. Men that are in a position to know the exact situation throughout this section, particularly the operators that have struggled for months to supply the trade, realized the absolute necessity of just such action as that taken by Dr. Garfield, and heartily agree that unless there was a better car supply and a more

rapid movement of both loaded and empty coal car equipment there was no possible escape from untold suffering.

CHICAGO

Supply inadequate. Railroads badly crippled with burdens increasing in the city fuel administrator's office.

During the past week pooling has been in full force, and has resulted in confusion and dissatisfaction. That there was not enough coal arriving in Chicago to go around, caused pooling to be put in force by dealers at the instance of fuel administrators. The result was that some dealers got more than their share of the available supply, while others that had in the yard and in transit sufficient coal to properly care for their clientele, were cut short.

The confusion was no doubt made worse by the placing at one dealer's yard of mine-run or screenings when he had coal of better grade—lump, egg and nut—tied up by the railroads. A dealer who was handling Indiana mine-run, for instance, would get Illinois lump egg or nut. In fact, when a dealer got coal he did not know whether it was coal shipped on contract at a higher or lower price than that allowed to be charged on open market current shipments.

Some dealers with facilities for handling large tonnages took advantage of the smaller fellow, and tried to get all the pool coal that was placed for unloading.

Chicago's first days encounter with the "no coal" order was a demonstration of the city's patriotic acquiescence. Thousands of factories shut down and remained closed until Jan. 25. Late advice from Washington decreeing that certain large factories would be allowed to continue operation was received with considerable satisfaction. This latest order affected only some of the large steel mills and plants engaged in the manufacturing of food stuffs. It will have the effect of allowing thousands of men and women to continue at work.

Very small tonnages of coal has reached this market during the past week except from Illinois and Indiana. Occasional shipments of hard coal have come in, but Eastern and Kentucky bituminous have been of extremely limited quantity.

Quotations in the Chicago market are as below, per net ton f.o.b. cars at mines:

	Williamson and Franklin	Saline and Harrisburg	Fulton and Peoria	Springfield	Carterville	Grundy, LaSalle, Bureau and Will
Prepared sizes	$2.65@2.80	$2.65@2.80	$3.00@3.15	$2.65@2.80	$2.65@2.80	$3.35@3.50
Mine-run	2.40@2.55	2.40@2.55	2.75@2.90	2.40@2.55	2.40@2.55	3.10@3.25
Screenings and washed slack	2.15@2.30	2.15@2.30	2.50@2.65	2.15@2.30	2.15@2.30	2.85@3.00

	Clinton and Sullivan	Knox and Greene	Eastern Kentucky	Smokeless: Pocah. and W. Va.	Smokeless: Penna.	Hocking	West. Va. Splint
Prepared sizes	$2.65@2.80	$2.65@2.80	$3.10@3.25	$2.60@2.75	$2.60@2.75	$3.05@3.20	$2.85@3.00
Mine-run	2.40@2.55	2.40@2.55	2.85@3.00	2.45@2.60	2.45@2.60	2.70@2.85	2.60@2.75

MILWAUKEE

Coal and coke temporarily advanced 75c. per ton to meet increased cost of cartage. Supply sufficient, but dealers are weeks behind in deliveries.

Owing to snow blockaded streets, which make the use of wagons and trucks almost impossible, the county fuel administrator has granted Milwaukee coal dealers an advance of 75c. per ton from Jan. 18 to Feb. 20, inclusive. This advance will not apply, however, when a consumer does his own carting. Deliveries at present are confined to emergency cases and are made with sleighs. Rates are now as follows: Anthracite egg, $9.95; stove, $10.20, nut, $10.30; buckwheat, $8.40; Pocahontas, $9.75; screened coke, $10.75; pea coke, $8.75. Added to this is a charge of 50c. per ton for carrying in. At the various ward stations and city engine houses, where coal is sold, the charge has been increased from 45 to 48c. per 90-lb. basket and from ½c. to 6-10c. per pound for lots ranging from 100 to 300 pounds.

There is not much hard coal left in the yards and enough orders are on hand to clean this up. There is plenty of soft coal, however. Some hard coal will be received by rail between now and spring, but this source of supply is uncertain.

W. N. Fitzgerald, state fuel administrator, states that there were 116,000 tons of anthracite and 681,000 tons of soft coal on the docks of Milwaukee on Jan. 1, and 40,000 tons of anthracite and 400,000 tons of soft coal at other Lake Michigan ports. Notwithstanding this apparently ample supply, he urges Wisconsin people to practice the strictest economy in the use of fuel. The question concerning the control of Wisconsin coal has been definitely settled in favor of Administrator Fitzgerald, who made a trip to Washington in regard to the matter. If any coal can be spared from the state it will go to Minnesota and the Dakotas, but Wisconsin officials are to decide.

All coal yards at Kenosha, Wis., have been taken over by the county fuel administrator, who is letting the supply go in half-ton lots only. Teamsters in that city were demanding $20 per day to deliver coal.

ST. LOUIS

Most acute situation prevailing. Mines idle for week to ten days. Railroads utterly collapsed; no service. Fuel Administration causes drastic local measures. Some slight relief in sight for the present week.

The local situation is almost on the verge of a panic and while St. Louis has coal and so has Missouri, the conditions are bordering on the edge of a famine, caused principally by the utter failure of the railroads to get in shape.

Some mines have not worked for over a week on account of the railroads being unable to bring empties or remove loads. The worst offender is the Illinois Central, where an entire system has almost gone to pieces. This system is perhaps the most incompetent of all locally when it comes to assisting the Government and taking care of the public. This line permitted loads to accumulate at East St. Louis so that an embargo could be used against that point, thus forcing all the Illinois Central coal in southern Illinois to Chicago.

Gale, Ill., which is the gateway to southeast Missouri, Arkansas and Louisiana has also been embargoed shutting off the entire Southwest from Illinois coal shipped off the Illinois Central.

Other roads succeeded in getting opened up in the middle of the week and while cars were scarce the mines succeeded in working part of the time. The railroads, however, confiscated nearly all of this coal. It developed that these roads had only one day's supply of coal ahead.

It is claimed that certain railroads with mines in Missouri and Western states and also mines in Illinois are using the coal from their own mines for commercial purposes and demanding railroad coal from the Illinois fields and from mines other than their own.

The Missouri Pacific R.R. confiscated 125 cars of domestic coal, all the coal on that line, almost causing a disaster in several places.

The Wabash also went to pieces and had to confiscate coal from the yards of dealers.

In the Carterville field nearly the entire output is going to railroads on Government order, and the same condition prevails to a great extent in the Mt. Olive, as well as in the Standard field.

The Terminal in St. Louis found itself without coal and had to confiscate even when it had orders not to do so. The Terminal R.R. went to pieces utterly, even under Director McChesney, who was recently appointed by Secretary McAdoo. Hundreds of cars of coal were at East St. Louis that this road could not take. As a matter of fact there has been coal at East St. Louis for two weeks that it could not touch. On Saturday, the 19th, St. Louis was almost entirely without coal for its retail yards.

Missouri is in pretty fair shape as far as steam coal is concerned, and there was no occasion for the five-day order of the fuel administration applying to the State of Missouri.

Administrator Crossley issued instructions to the state, closing up places of business at 7 o'clock, with certain exceptions, and this has become general throughout the state and included the order for breweries, which are closed for two days weekly, and in Kansas City saloons for two days, and moving picture houses in an effort to curtail coal consumption 25 per cent.

In St. Louis there have been some few cases where there was actual suffering for coal, but these were speedily relieved and in a general way St. Louis is perhaps the best-situated city in the country for fuel.

The Union Electric Light and Power Co. has a good supply of coal on hand, but the Laclede Gas Light Co. is extremely low.

With the shutting down of the factories in East St. Louis, this threw a large tonnage to the west side, so that in two days' time the plants in St. Louis proper had fully a week's supply on the road.

Mining conditions throughout the southern Illinois field are not good. Miners refuse to work on account of deep snow and train service being irregular.

At Collinsville they would not work because the wash room was not warm enough and it would appear in several instances that the miners had deliberately without just provocation refused to work. It is to be hoped that the Government will soon put into effect a system of registration for every mine worker and allot him a certain amount of work to do every day, with a punishment for failure to comply. This sentiment is rapidly gaining ground in this section.

The prevailing market per net ton f.o.b. mine is:

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80

Williamson and Franklin County rate is 87½c. Other fields, 72½c.

KANSAS CITY

Temperatures of 16 deg. below zero emphasized the coal shortage in Kansas City recently and while a short period of warm weather "saved the situation" temperatures soon fell again. At that time there were 10,000 tons of coal available in the city and orders for more than 15,000 tons. There was some suffering among the domestic users; but there was also a wider-spread tendency to conserve coal among those who had it in their bins. Orders had been issued that moving picture houses and churches be closed and this suggestion was followed except in places where picture shows got heat and light from outside sources.

Conferences are being held in Kansas City between the coal operators and the fuel administrator, the Chamber of Commerce and other agencies seeking to list the industries and large coal users which can and will suspend operations temporarily or at stated times in order to reduce the local demands on the coal supply.

SEATTLE

State fuel administrator recommends reclassifications of states coal and revision of prices at the mines. Output for last year greater than previous year.

Recommendations for a reclassification of all coals produced in Washington and a revision of prices at the mines have been forwarded to Washington, D. C., for the approval of the Federal Fuel Administrator. While the state administrator has refused to give out what the new prices may be he has let it be known that in some instances the prices will be higher and in others lower. The reclassification and the price lists are in much more detail than those of any other order thus far promulgated by the Federal Fuel Administrator.

A report submitted to the state fuel administrator by the Washington Coal Operators Association estimates the production of coal in this state during the past year as 3,979,576 tons as compared with 3,019,600 tons in 1916. The above are for short tons. Final figures which have yet to be compiled are expected to show a decrease of 30,000 to 40,000 short tons in this estimate of the total production for 1917, since mines with a daily capacity of nearly 7000 tons were closed for several days the last of December because of floods. In addition the mines at Carbonado, Wilkeson and Renton were closed most of the latter part of December and these three districts have a combined daily production of about 1900 tons.

Importation figures show total imports into the state during the past year from Wyoming of 95,000 to 100,000 tons; from Utah, 26,890 tons; and from Vancouver Island mines of 208,572 tons.

COAL AGE

Volume 13 NEW YORK, FEBRUARY 2, 1918 No. 5

The Honor of the Coal Industry

REPUTATION is what we seem to be; character is what we really are. The test of the character and honor of the coal industry is now taking place.

The Nation needs coal so badly that it does not complain loudly at the present time, even when it is fed with fuel that contains an undue percentage of slate.

Are producers of coal taking advantage of the people's emergency? Most of them are not, but a few unscrupulous individuals and companies have shipped carloads of dirty coal; and their action threatens the good name of the industry.

THERE is always a day of reckoning. When the time comes that coal is not so scarce and therefore not so vital to the Nation's life, will it not be worth something if coal owners and coal miners can stand at the bar of public opinion and hear the words "Well Done"?

In the rush of getting it to market coal is being handled more roughly than ever before; and it must of necessity follow that there will be more fine coal and fewer lumps in what the average consumer gets. The public must be informed of this fact. However, there is no excuse for the miner to load slate, nor for the operator to ship it.

THE weak spot in our national crisis is railroad locomotives. We lack several thousand badly needed engines. We also lack men to repair the locomotives we now have. Every pound of freight must do its part. Every ounce of rock or slate that is hauled on our railroads today will have as its measure of cost just so many drops of the lifeblood of American boys fighting for us in France next summer.

Every other aim must be subordinate to our present business of winning the war. Each one of us must have his war program and a clear-cut sense of personal duty. The miner at the face who knowingly shovels slate into his car, or the operator who permits him to do it, is just as much a traitor as the man who sells Germany the details of a war secret, and is just as much an enemy as the Teuton who sticks a bayonet into one of Uncle Sam's soldiers.

THE *boys at the front have faith in us. If any of them die, let it be by German bullets and not through our carelessness and inefficiency here at home.* Mining coal today carries with it a responsibility greater than that of any other industry.

IDEAS AND SUGGESTIONS

Promotion

By Robert Littlehales
Smithton, Pennsylvania

How often the remark is heard: "Why, he is active enough and means well, but he doesn't seem to know anything." Some men are all "fuss and feathers." Mere fussiness cuts no figure. You can be here and there and still be nowhere. Other men are all "slam bang." If they drive a nail, they must dent the board. They lift a one-pound weight with five-pound effort.

Direct your effort by every ounce of intelligence you possess. Say what you mean, but say it as it ought to be said. "What do they say of me in the departments through which you have passed?" asked Napoleon. "Sire," replied M. de Narbonne, "some say you are a god, others say you are a devil; but all are agreed that you are more than a man." That was diplomatic. Napoleon knew that he was called a god and a devil, but "more than a man" smothered impossibility and drew the sting.

Don't cry about your lack of opportunity. Make it! Don't try to be a martyr! Don't assume the role of suffering innocence! Don't nurse your nerves! Don't coddle your whims! Don't "baby" your sins! *BE A MAN.*

Unless you fill the place you now occupy, you cannot expect to fill a more important one. Life, be it physical or mental or financial, should be a series of moultings. The lobster casts its shell because its soft body has become too large for the house. You can never get a better position than the one you have now unless you grow too large for the latter. Or, if you secure that better position, you can only keep it because you have somehow grown to that size.

Priming Centrifugal Pumps

One of the difficulties met with in the operation of a centrifugal pump is the priming, and for this reason a number of operators are using the plunger rather than the centrifugal type of pump. Various methods of priming have been tried, some of which were successful and others not. The Clearfield Bituminous Coal Corporation at its Rossiter mine, Rossiter, Indiana County, Pennsylvania, has succeeded in devising a priming device that has operated very successfully.

In the pumping room at the foot of the main slope (it is also at the foot of a manshaft) the company has three 600-gal. single-stage Morris centrifugal

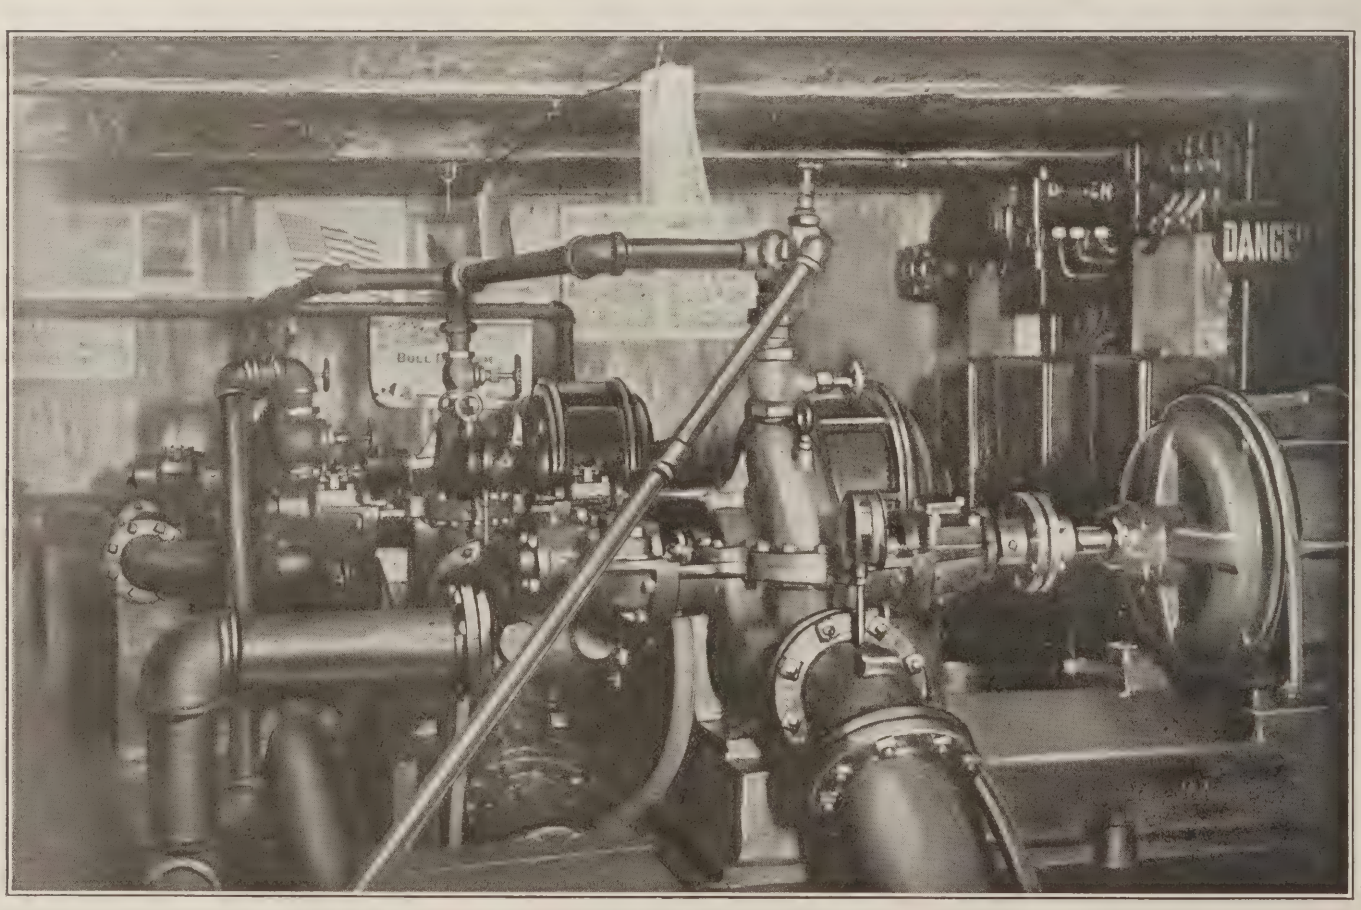

FIG. 1. PUMPROOM OF CLEARFIELD BITUMINOUS COAL CORPORATION, ROSSITER, PENN.

pumps arranged in a battery. These pumps have separate suction lines, but they all discharge into a main discharge line that goes up the manshaft to the surface, making a head of 80 ft. for the pumps to work against. The pumps have a maximum lift of 9.23 ft. on the suction line. The pumproom itself, as can easily be seen in Fig. 1, is built entirely of concrete.

The Clearfield company has had considerable trouble in operating these pumps. It has been difficult to prime them, as they would not start until there was 7 lb. pressure in the discharge line. First the plan was tried of keeping the water in the pumps from running back to the sump by means of foot valves, but these valves would stick and leak, and they caused a great deal of annoyance.

Next priming was tried by means of an auxiliary pump, an electric-driven plunger pump built by Deming.

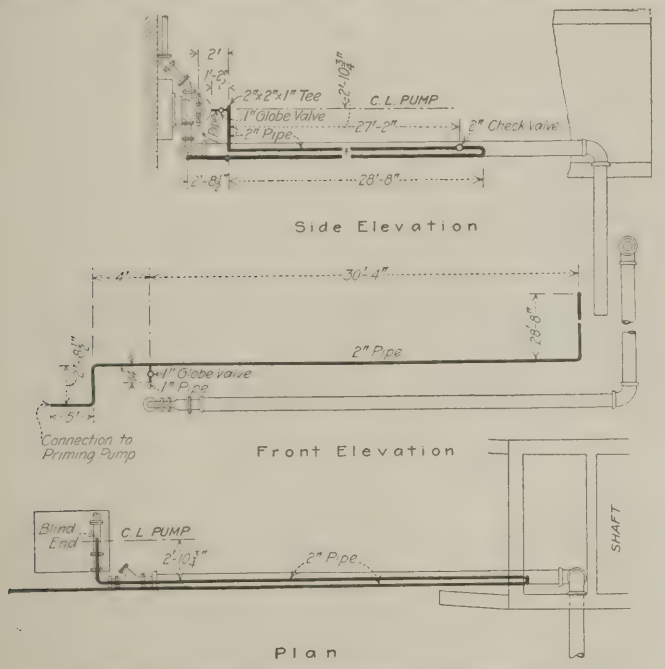

FIG. 2. HOW PIPES WERE CONNECTED

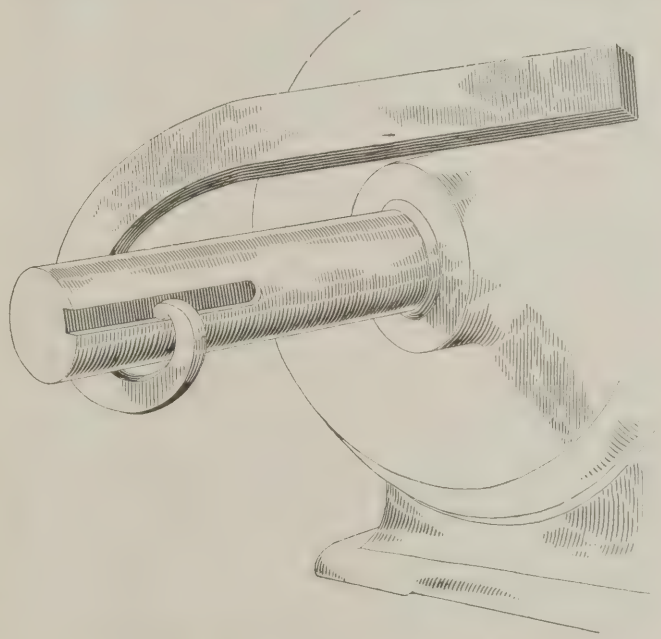
The water was pumped into the centrifugal pump through the priming hole. Foot valves were placed on the suction pipes, and the plunger pump was run until the water filled the suction pipe and the pump, and rose 14 ft. in the discharge pipe. Then the centrifugal pump was started. This method was found to be too slow, particularly if there were bad leaks in the foot valves, though it is still used in case of emergency.



It was then decided that if a vacuum could be produced in the pump the water would rise from the sump into the suction pipe and then into the pump. This method was found to be successful and much quicker than the methods first tried. Further, it eliminates all trouble due to leaking foot valves.

A 2-in. pipe was connected by branch lines to each of the priming inlets of the pumps, as illustrated in Fig. 2. These branch lines each consist of a 1-in. nipple, a 1-in. globe valve and another 1-in. nipple. The main 2-in. pipe was run to the main shaft, 30 ft. away, and then up a distance of 28 ft. 8 in. This, together with the difference in elevation between the center of the pump and the 2-in. pipe line, makes a total distance of 31 ft. 4½ in., or higher than water will rise in a vacuum. A check valve was placed near the top of the line, and at the top of this pipe a 2-in. return elbow was located, then a 2-in. pipe was run down again to the pumproom, to which was connected a blower operated by a 2-hp. motor.

When it is desired to prime the pumps, the main discharge line valve is closed and the blower started. This sucks the air from the 2-in. pipe, the pump and the suction line, causing the water to rise in the suction pipe, the pump and the 2-in. pipe line. As soon as the water reaches a height of 14 ft., as indicated on a pressure gage at the bottom of the discharge line, the large centrifugal pump is started, the large valve in the discharge pipe opened and the water discharged through this to the surface.

Spanner Wrench for Rotating Shafts During Erection or Repair

The illustration below shows a spanner wrench for shafts that has proved so useful that others should know of it. The wrench is made of 1 x ½-in. steel, and can be used on shafts from 1 to 6 in. in diameter without damaging the keyway. The shape of the tool is the result of something like two years' evolution. It is christened the "Twister" and is used for rotating (by

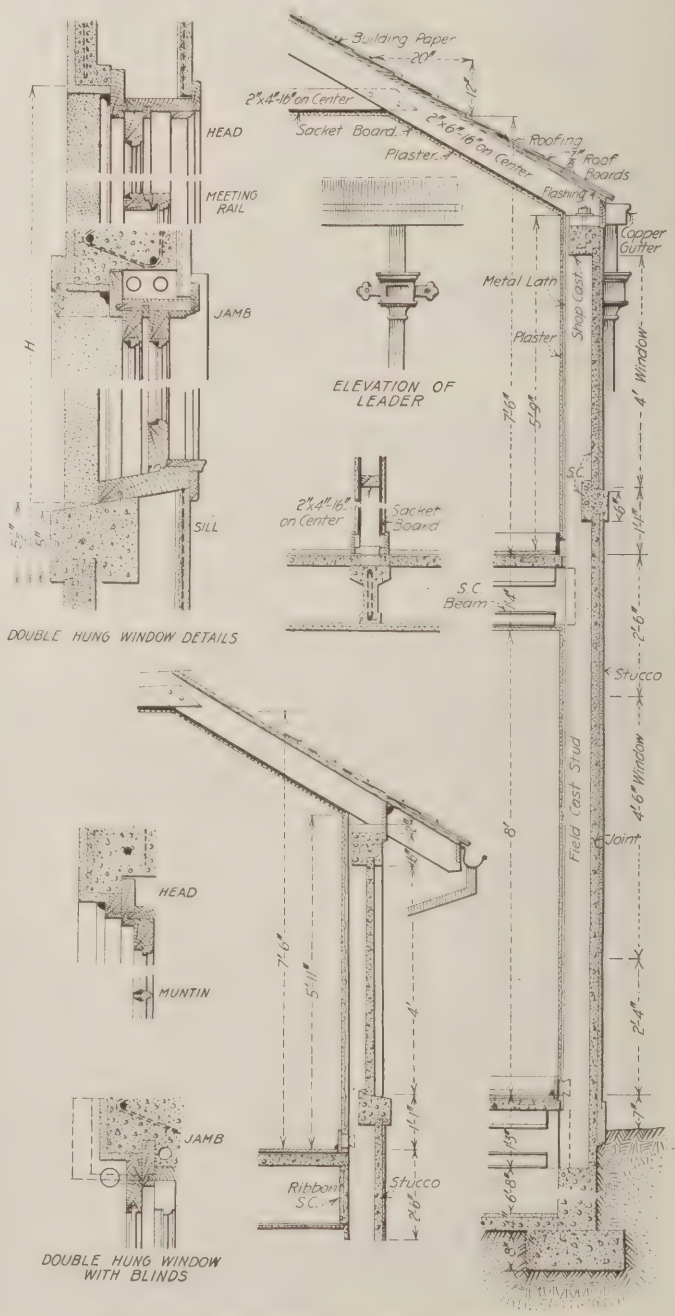
SPANNER WRENCH FOR FINISHED SHAFTS

hand) armatures and the like during the process of erection, repair and inspection, and of course it works equally well on other similar things. The need of something of the kind is shown by the condition in which keyways on shafts are so frequently found, these being damaged by the use of monkey wrenches and pipe wrenches.—*Power.*

IN THE OPENING OF A NEW MINE, the fixing of the daily capacity is of great importance, for on this depend the number of houses to be built and the number of mining machines and locomotives required. The capacity of the power plant and numerous other items depend on the greatest output to be handled in one day and not on the average output.

Precast and Field-Cast Concrete Houses

By J. B. WARRINER
Chief Engineer, Lehigh Coal and Navigation Co., Lansford, Penn.



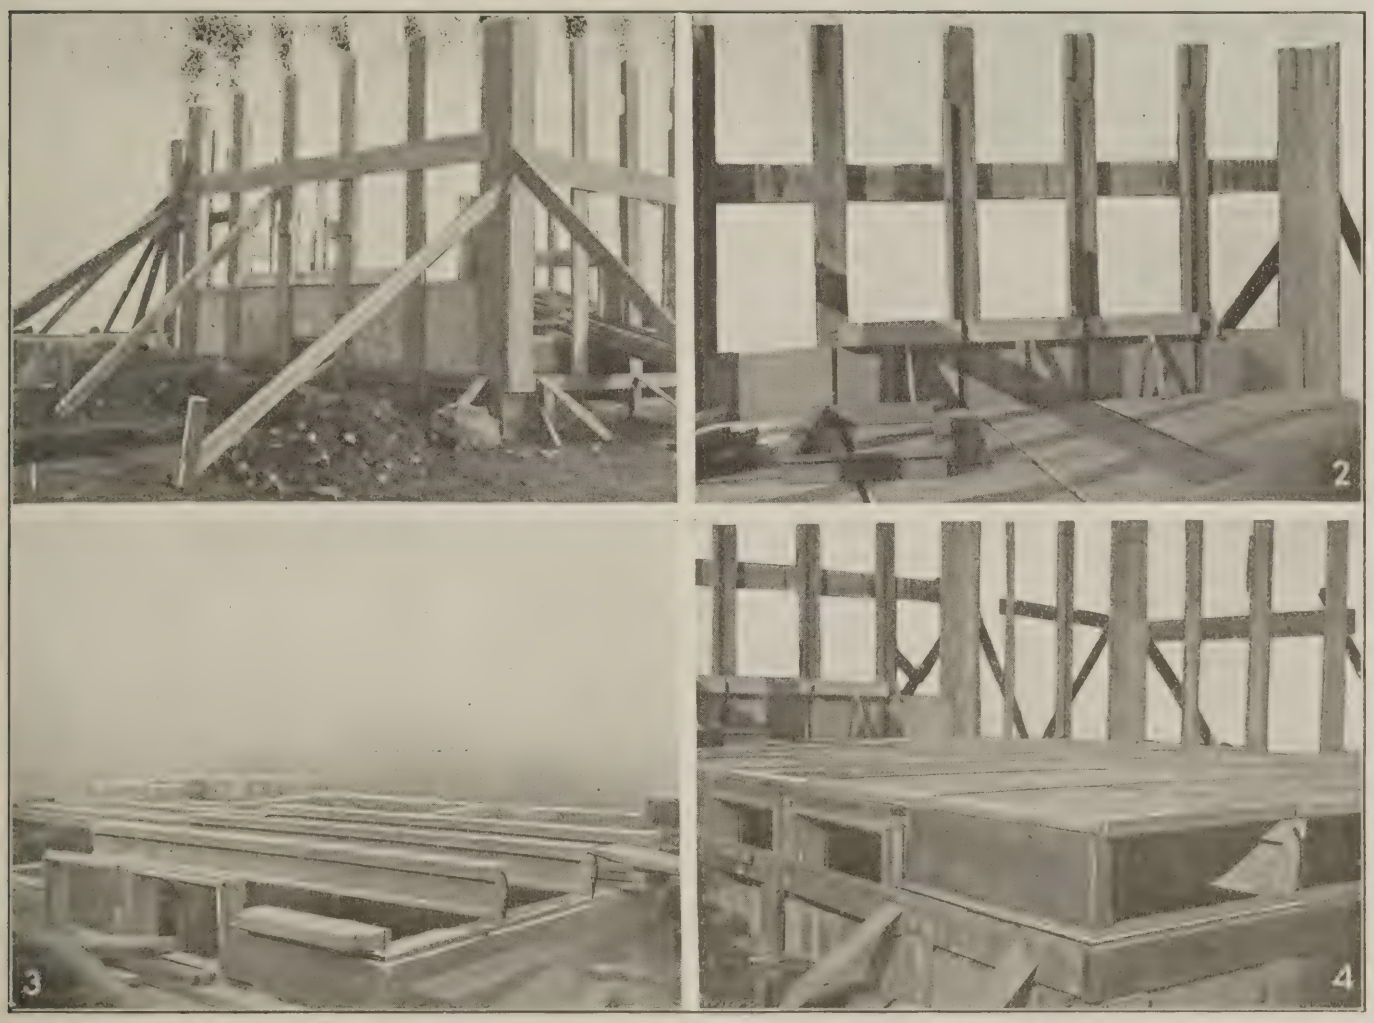
SYNOPSIS — *Concrete is everywhere throughout the coal fields encroaching upon the domain heretofore occupied almost exclusively by wood. This article describes the construction of dwellings built of a combination of precast and field-cast concrete. Wood is employed for roof framing and sheathing.*

IN ACCORDANCE with the welfare work already undertaken by the Lehigh Coal and Navigation Co. at Lansford, Penn., in providing suitable houses for its miners, laborers and mechanics, it is now erecting for the clerks, engineers and superintendents six detached and four semi-detached dwellings, under the direction of Mr. Ludlow, the vice president. These will be situated in the Borough of Lansford, and will be not only artistic and modern but also out of the ordinary in the type of buildings met with in the mining field. The houses are located on ground in the center of the town the site of which was formerly occupied by a culm bank that has been removed and run through one of the company's breakers.

As a departure from the old practice of coal companies building houses all alike, this group will consist of five different types of dwellings. Each house will have a lot from 40 to 45 ft. in width and 150 ft. in depth.

The houses will be of "Simpson Craft" construction, a new method of building fireproof buildings consisting of making 90 per cent. of the structure, such as floor-beams and slabs, window sills and lintels, wall slabs, partition studs, stairs, chimneys and porches, of concrete in standard molds, in a casting shop located at the site. Here the work may be cast quickly and the surfaces may be finished with wood float on convenient benches, during weather when it would be impossible to carry on usual building operations. Later these parts are set up in place and bound together by casting certain field sections.

After the cellars are dug, a footing course of concrete 8 in. in thickness and 20 in. wide is laid for the outer walls of the buildings, and upon this is cast a solid wall 8 in. in thickness up to the underside of the floor-beams. Channel-shaped field forms spaced 3 ft. 4 in. on centers are then set up on the wall and against these are placed the edge of the wall slabs, ends of lintels, sills, floor-beams, window and door frames. A similar channel section, somewhat greater in depth, is then placed inside of the building directly back of the one on the exterior, thus forming a pocket for a small column, or stud, while holding the shop-cast



DETAILS OF "SIMPSON CRAFT" CONSTRUCTION

pieces correctly. When all stud forms and sections are in place up to the underside of the roof rafters and the reinforcing steel rods have been placed in the studs, concrete is poured into these pockets, which extend all the way to the roof. As they become filled, the concrete settles around the ends of the sections projecting into the pockets and firmly embeds and secures them.

To overcome the dampness and sweating of concrete walls as usually built, and at the same time to add warmth to dryness, the Simpson Craft method provides on the inside face of the wall studs small wire "hair pins," spaced 6 in. on centers which are built in when the studs are cast. Over the ends of these are forced the outside face of the slabs at these points during casting. Large air spaces are provided between the studs and, as the paper is placed against the inner face of the studs and the rib of the lath is nearly an inch in depth, another air space of that width is provided between the plaster and the paper. This air space extends entirely around the building, cutting off the exterior from the interior face of the wall, effectively damp-proofing, frost-proofing, sound-proofing and insulating the walls.

When the concrete is mixed 5 per cent. of hydrated lime is added to the cement. This not only helps to make the concrete flow more smoothly, but permits a

ILLUSTRATING DIFFERENT STAGES IN THE HOUSING DEVELOPMENT OF THE LEHIGH COAL AND NAVIGATION CO. AT LANSFORD, PENN.

Ninety per cent. of structure is cast in standard molds, in a casting shop located on the site

sheets of heavy waterproof felt, lapped well at all joints and tightly secured to the edges of all door and window frames. When the paper is in place, a metal lath with heavy outstanding ribs is forced over the ends of the hair pins and a small wire threaded through the loop, after which the loops are tightly twisted, securely locking both paper and lath to the studs. The walls are then plastered three coats in the usual manner.

The slabs for the exterior walls are only 1 in. in thickness except when used in those types of houses calling for plain surfaces, in which case ½ in. of stucco is added on the outside, after the work is erected. Provision is made for securing the stucco by roughening finer surface treatment and at the same time waterproofs the concrete. The only finishing required for the exterior walls is the touching up of the projecting studs around the panels, except, of course, the lower portion of some of the buildings where they are stuccoed. The outside of all walls, when dry, is gone over with two coats of Cabot's cement stain in selected color and a pleasing and permanent surface obtained. The stairs, which are also of concrete, are precast with the treads and risers in one piece. A box string of concrete is cast after the treads and railing are set up, and surrounds the ends of the treads and provides a base upon which the plaster of the wall finishes. The

HOUSE OF "SIMPSON CRAFT" CONSTRUCTION

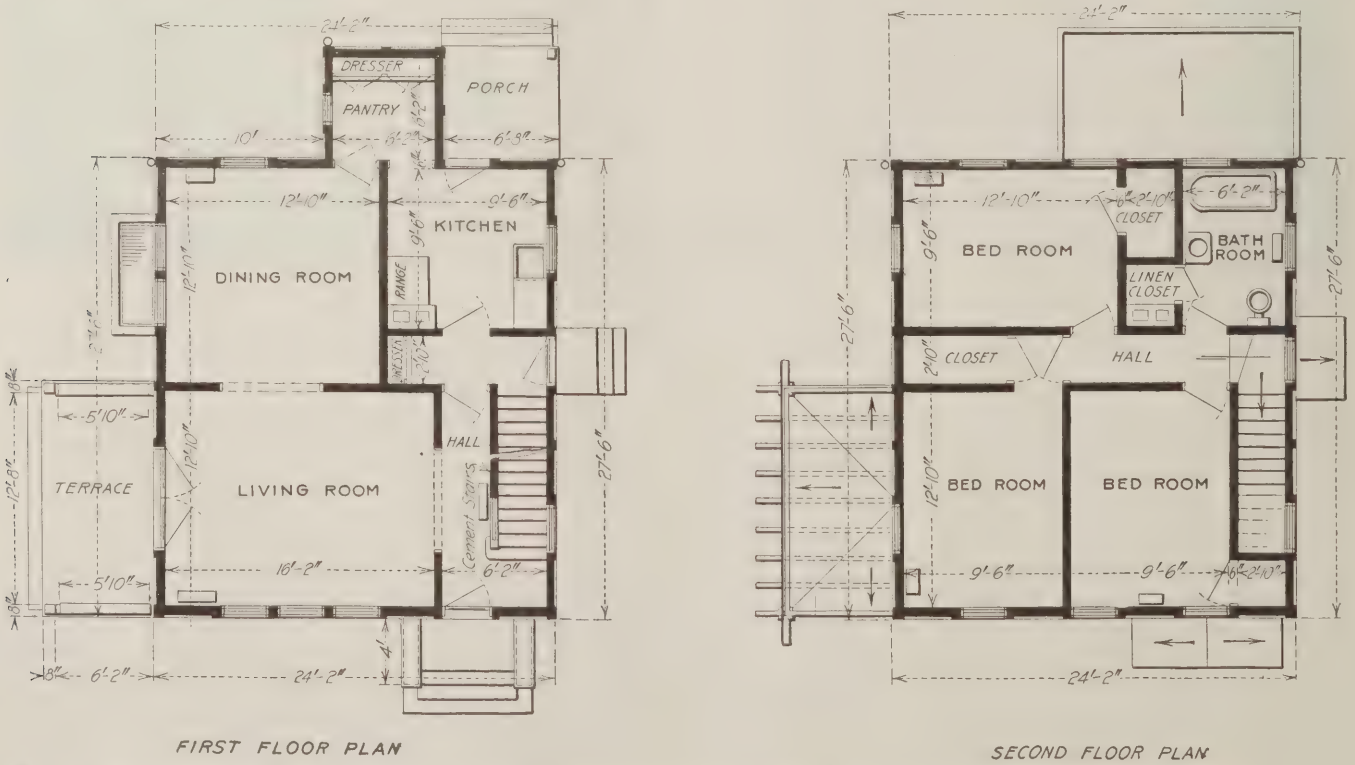
stair railing and newels are also of reinforced concrete, precast and set in place when the stairs are erected.

The chimneys are likewise built of precast sections and have specially designed smoke-proof expansion joints to allow for changes in temperature and to guard against the leakage of gas. The finished floors and base are of cement, with sanitary cove.

The partition studs on the first floor are precast concrete, covered with metal lath, and on the second floor are of wood covered with wire mesh backed with heavy waterproof plaster applied direct thereto. The roof framing is also of wood.

The roofs are covered with asphalt shingles, green and red in color, applied to wood sheathing. All houses are heated by steam and have sanitary open plumbing and electric lights. Simpson Craft construction is the invention of John T. Simpson, C. E., Newark, New Jersey.

Each house provides a reception hall, large living room, dining room, kitchen, pantry, front, side and rear porches on the first floor; three bedrooms, bathroom, three large bedroom closets and a linen closet on the second floor. There is a full cellar under the entire house, subdivided into three separate rooms by 6-in. solid concrete walls.



The houses were designed by Simpson & Briscoe, Inc., architects and engineers, of Newark, N. J., and are being built by the Shamokin Lumber and Manufacturing Co., of Shamokin, Penn., under the immediate charge of J. B. Warriner, chief engineer of the Lehigh Coal and Navigation Co. The total cost, for the ten dwellings, complete, exclusive of ground, will be $35,000.

How a Forty-Ton Drum Was Moved Up a Mountain

By Ralph W. Mayer
Roslyn, Wash.

The Northwestern Improvement Co. had two drums weighing 16 and 40 tons each to move about a mile up a mountain side to its newly developed Mine No. 8. A double-track incline extends from the tipple to the mouth of the mine, at the entrance to which the hoisting engines and drums were to be installed. A wagon road also led to the mouth of the mine, but it was not suited to the hauling of heavy machinery.

The two tracks on the incline were spaced equally distant throughout their entire length. Every fifth tie extended under the full width of both tracks and was spiked to all four rails. Where it was not advisable to use ties of this length, short single-track ties were laid under the inner rails of each track, these being spiked fast to the rails. In this manner the two tracks

FIRST FLOOR PLAN

SECOND FLOOR PLAN

FLOOR PLANS OF FIREPROOF DWELLINGS NOW IN COURSE OF ERECTION AT LANSFORD, PENN.

were held a uniform distance apart for their entire length and were prevented from spreading.

The engines and smaller fittings were hoisted up the incline first, a small electric hoist, which had been used on development work at the mine, furnishing the power. The smaller of the two drums was then taken up. It was moved to the foot of the incline on two trucks specially built to transport heavy machinery. The wheels of these trucks were of the same diameter, and extra strong. The two axles of the rear truck were fastened rigidly together in a manner somewhat similar to that employed in trucks used under railroad cars. Pieces of 10 x 10-in. timber were mortised and placed on top of the axles, forming a platform between them. These timbers were fastened to the axles with U-shaped irons, or clevises, bolted around the timbers and axle. The axles were placed just far enough apart so that the wheels would not interfere with each other. A space of 10 in. between the front and rear wheels of each of the trucks is sufficient.

Construction Details of the Truck Platform

A 12 x 12-in. timber is bolted fast to this platform between and parallel with the axles, for a bolster to carry the weight of the load. The wheels being low the load is thus carried above them, and out over them if necessary. Two iron bars connect the front and rear axles. These are placed near the wheels and underneath the axles, being fastened to the latter by iron clamps. Thus no holes are drilled in the axle, and it is not weakened. The front truck also consists of four wheels and two axles rigidly fastened together. The platform on the axles is made by placing two 10 x 10-in. timbers from axle to axle and next to the wheels. These two side timbers are allowed to extend beyond the front axle for about 2 ft., and holes are bored in them near their ends through which a rod is passed to hold the tongue of the truck. The middle timber of the platform is made shorter, so that it only reaches a few inches in front of the axle. The tongue is made of the same-sized timber and placed in line with this middle stick, 6 in. separating their two ends.

Two timbers of the same size are placed alongside this middle stick and the tongue, and securely bolted to the latter. These sticks, or hounds, have holes bored through their free ends, and an iron rod passed through these holes and similar holes in the two side timbers of the platform, allowing the tongue to move up and down. These two side timbers, or hounds, only extend back from the tongue to the front axle.

A small wheel on a swivel or an iron shoe is placed on the end of the tongue to prevent it from digging into the ground. A timber is bolted crosswise to the three platform pieces between the front and rear wheels. Iron braces are used to fasten it securely to the platform timbers.

On top of this cross timber a bolster is placed. This cross timber is mortised into the platform so that the front and rear bolsters are the same height. The timber and bolster are reinforced with flat plates of ½-in. iron, and a ½-in. iron strap passes from the platform up over the bolster, both of its ends being fastened securely to the platform. A kingpin passes through a hole in the iron strap on top of the bolster and down through the bolster and platform. The bolster being thus fastened in the middle, its ends are free to move back and forth. The rear axle of the front truck and the front axle of the rear truck are connected together by means of two chains fastened X-fashion, the one chain being attached to the right side of the front axle and to the left side of the rear axle, and the other chain *vice versa*.

The load is pulled by a chain fastened to the front axle of the front truck. The end of the tongue is attached to the chain so as to guide the truck. The load is moved by a donkey engine on skids, which can be moved along by the engine or by a team of horses with block and tackle.

A 1-in. cable was stretched out for a quarter of a mile or so and its end made fast to a deadman. The block was then made fast to the cable at each shift of the tackle. The piece of machinery was loaded on the trucks by jacking it up with the help of blocking, running the trucks underneath, then lowering it onto them. It was unloaded the same way.

The drum was moved to the foot of the tramway by this means and then placed upon four specially prepared trucks provided with roller-bearing mine-car wheels. The two axles of each truck were set as close together as the wheels would allow and fastened to two pieces of 10 x 10-in. timber placed side by side and parallel with the track. Each end of the timbers extended over the axle about 1 ft. The truck was stiffened by X-braces between the two timbers. A piece of 6 x 12-in. timber placed across each truck in the middle and fastened to the side frame carried the load.

Two of these trucks were used on each track. Pieces of 12 x 12-in. timber were laid from the front to the rear truck on each track, and cross timbers of the same size were placed thereon. The weight laid upon these cross timbers was thus distributed over the two tracks by the four trucks, two on each track, while the drum was carried between the tracks. The small drum was hoisted and set in place before the larger one. The boilers were not in place when the 40-ton drum was ready to be hoisted, but as compressed air was used in the mine and the engine driving the small drum was in position, it was connected to the air line and compressed air used to hoist the drum up the incline.

The drum was moved to the foot of the incline by placing it on 12 x 12-in. timbers chamfered at the ends and used as skids. Timbers of the same size were laid upon the ground and 2-in. iron rollers placed between them and the skids. A donkey engine was used to pull the drum. This engine was also used for dragging forward the timbers upon which the rollers were placed.

When hoisting the drums up the incline, three dogs, or drags, were used to prevent the load from running away should anything break. These were made from 12 x 12-in. timbers 16 ft. long. A piece of timber of this size was securely bolted across the rear end of the drum and directly underneath the drum shaft. A piece of 1-in. cable was passed around this timber and through a hole bored in the end of the drag timber, the two ends of the cable being fastened together by means of clamps, or clips. Several bolts were put through the drag timber on each side of the hole to strengthen it and prevent splitting. One of these dogs dragged on the ground between the two tracks, the other two dragging over the ties.

An Up-to-Date Power Plant — II

By DEVER C. ASHMEAD
Tarrytown, N. Y.

THE dam and the reservoir at the Clymer power plant are of particular interest, as they are good examples of a simple, permanent dam and reservoir, and could be used in a number of cases as a standard. The reservoir has a capacity of 8,000,000 gal. and covers an area of $2\frac{3}{4}$ acres. Its maximum length is about 800 ft. and the width at the widest point, which is at the dam, is about 320 ft. The maximum depth is 24.5 ft. The drainage area of the water shed which supplies the reservoir is 160 acres. Fig. 9 shows the size of the reservoir and Fig. 10 is a view of the dam and reservoir.

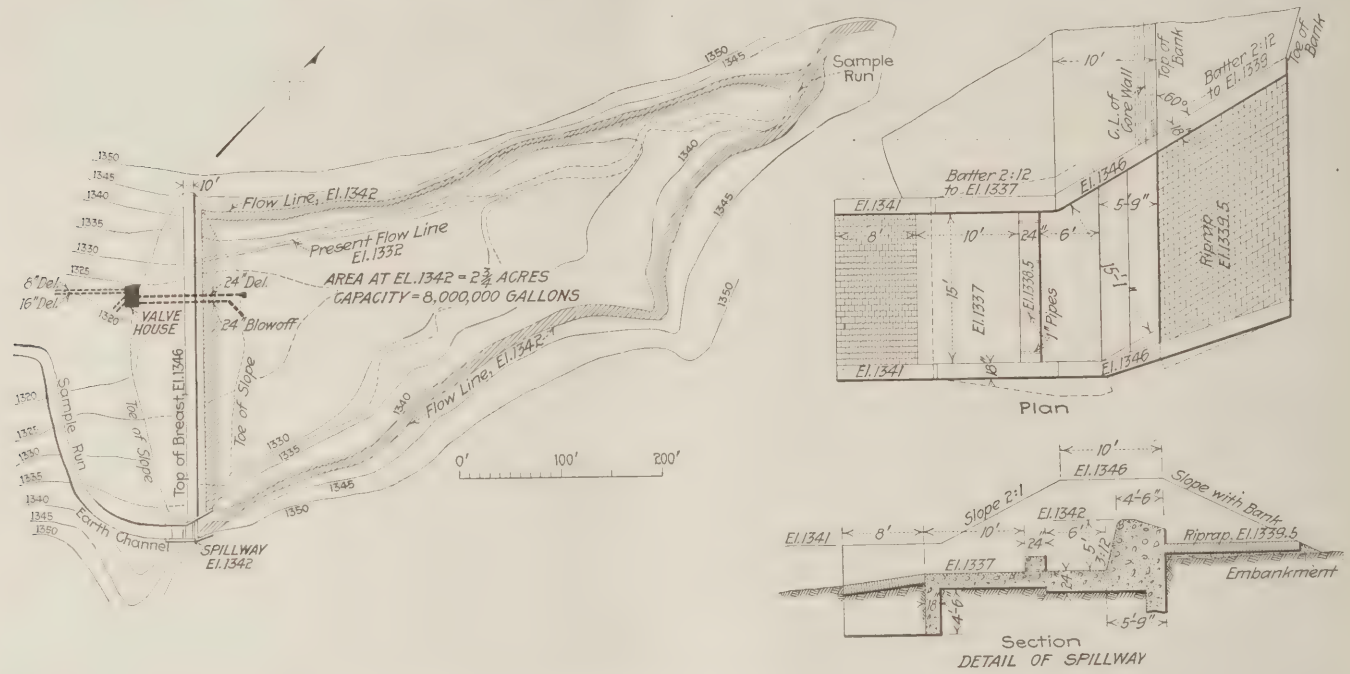


FIG. 9. PLAN OF RESERVOIR AND DETAILS OF SPILLWAY

FIG. 10. VIEW OF DAM AND RESERVOIR, GATEHOUSE IN FOREGROUND

The dam is constructed of earth with a concrete core wall. The depth, through the surface soil to bed rock, is about 10 ft. The rock is shale and the surface soil is clay (see Fig. 11). The surface soil was removed to a depth of 5 ft. for the core wall. The first 10 ft. of the core wall is 2 ft. 6 in. thick. The next 9 ft. is 2 ft. thick and the third and upper part is 10 ft. high and 18 in. thick, making a total height of 29 ft., thus putting the top of the core wall at an elevation of 1344 feet.

The surface soil was excavated to a depth of 2 ft. in order to remove all decaying vegetable matter and foreign substances before construction of the main part of the dam was started. This part of the dam was made of clay carefully rolled and tamped so that it formed a solid earth bank. The top of the earthen part of the dam is at a height of 1346 ft., or 2 ft. higher than the

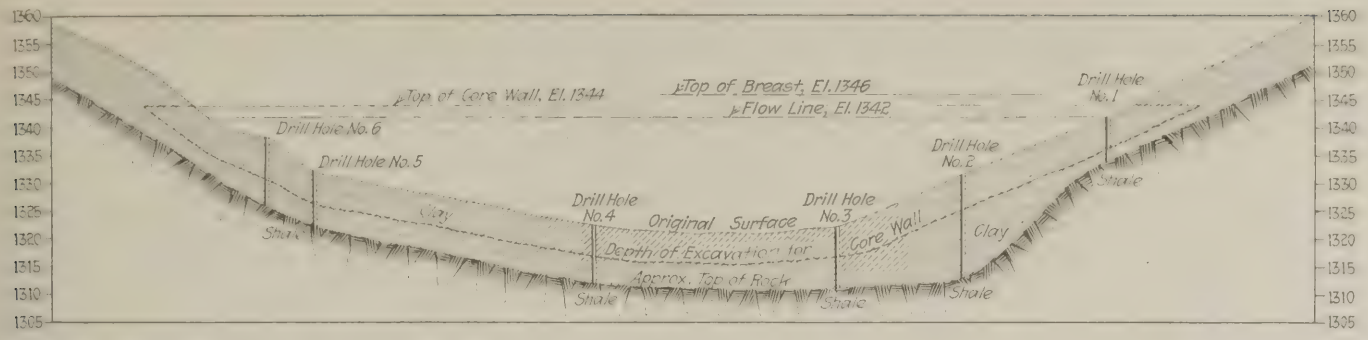

FIG. 11. SHOWING CHARACTER OF SOIL ENCOUNTERED IN SINKING FOUNDATIONS

top of the core wall. The top of the dam is 10 ft. across, and the center line of the core wall is set 4 ft. from the center line of the main dam on the upstream side.

The upper side of the dam has a slope of 2 to 1 and is covered with riprap, 1 ft. in thickness. The downstream side of the dam has a slope of 2 to 1 and is sodded. On the left-hand side of the dam, looking downstream, is the spillway, the top of which is at an elevation of 1342 ft., or 4 ft. below the top of the main dam and 2 ft. below the top of the core wall. The spillway, with the exception of the bottom of the approach and the discharge, is built entirely of concrete (see Fig. 9 for details). The upper approach to the spillway is riprap with concrete sidewalls corresponding to the shape of the main dam. These concrete walls are 18 in. thick. The water flows over the main part of the spillway and falls a distance of 5 ft. The opening through which the water passes over the top of the spillway is 15 ft. wide and 4 ft. high. The lower end of the spillway is made of riprap laid in mortar. The water, after it leaves the spillway, flows through an earthen channel until it joins the original creek.

Two pipe lines pass through the dam to the valvehouse, as is shown in Fig. 12, both these pipes being 24 in. in diameter. One is a delivery pipe and the other a blowoff pipe. Where they pass through the embankment, the pipes are laid in concrete cradles 6 in. thick. Two cutoffs on each pipe prevent leakage through the dam along the outside of the pipes. These cutoffs are made of $\frac{1}{8}$-in. thick reinforced wrought-iron disks, the outside diameter of which is 6 ft. The disks are set in concrete 18 in. thick.

In Fig. 12 the end of the discharge is shown resting in concrete. To this discharge pipe is attached a large metal strainer to protect it from taking in foreign substances. The blowoff pipe rests in riprap and is not protected.

Through a 16-in. cast-iron pipe the circulating water for the condensers is pumped back to the reservoir, to a spray system of cooling, by two 10-in. two-impeller turbo-volute pumps driven by Alberger-Curtis noncon-

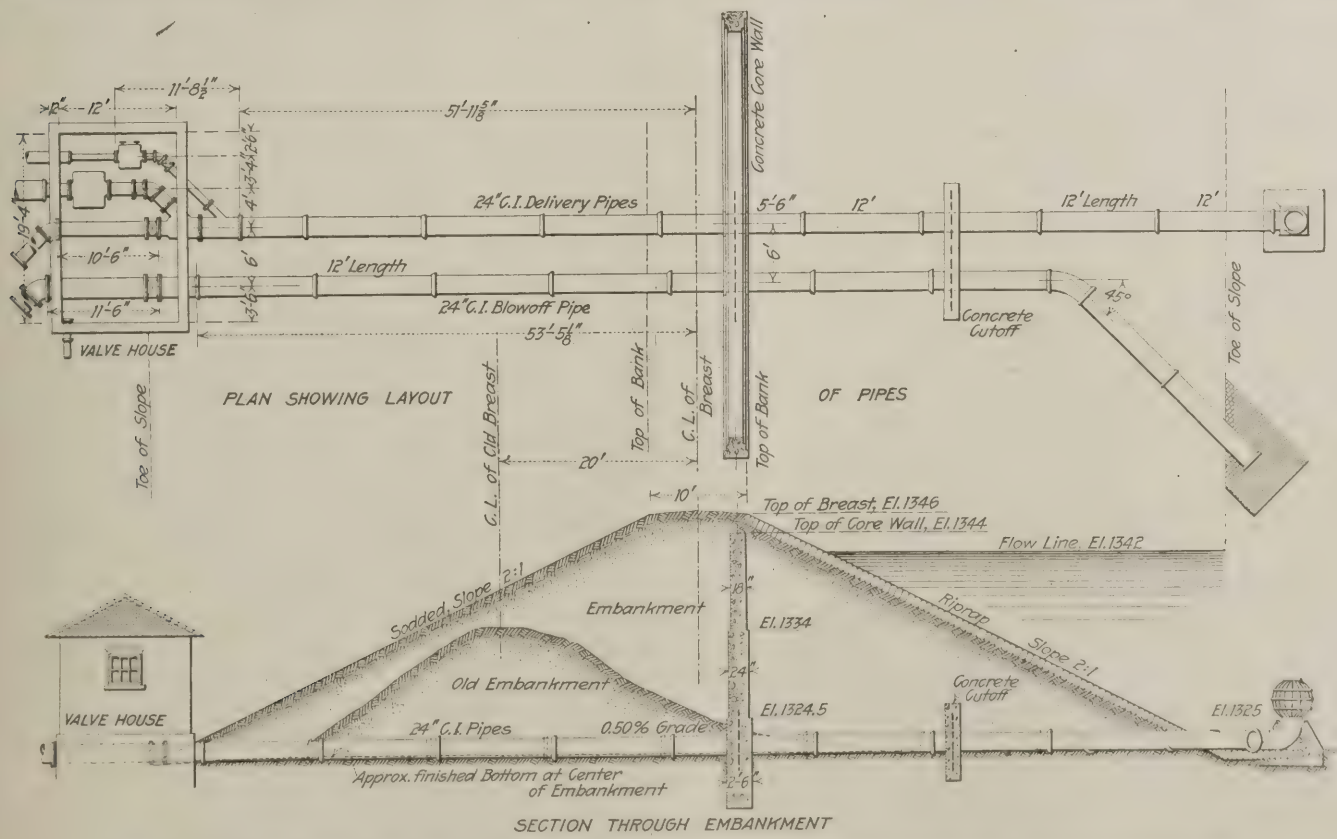

FIG. 12. CROSS-SECTION OF DAM AND ARRANGEMENT OF BLOWOFF AND DISCHARGE PIPES

densing steam turbines. Twenty-two standpipes and four branches to each pipe cool the water for the power house. The spray system was furnished by the Spray Engineering Company.

Outside Equipment of Power House

The transformers are mounted outside of the power house and consist of three General Electric H-60-500-kw., 6600/2300-volt, single-phase, oil-cooled transformers and three General Electric H-60-300-kw., 22,000/2300-volt, single-phase, oil-cooled transformers, together with the necessary choke coils, disconnecting switches and aluminum cell lightning-arrester equipment.

The three 500-kw. transformers will be employed to step up the generated voltage from 2300 to 6600 for use on the transmission line from the main station to the Sample Run slope substation at Onberg and the Barr slope substation at Hastie Run and Dixonville.

The three 300-kw. transformers are employed to step up the generated voltage from 2300 to 22,000 for use on the transmission line running from the power house to the West Branch mine substations near Barnesboro.

Four substations are supplied by the mine—one at Sample Run, one at Hastie Run, one at Dixonville and one at West Branch. The equipment of the Sample Run substation consists of two General Electric TC-60-300-kw., 1200-r.p.m., 550-volt, compound-wound, rotary converters with two banks of HJ-60-125-kv.-a., 6600/340-volt, indoor-type, oil-cooled transformers for use with the above rotary converter, together with the necessary choke coils, disconnecting switches, switchboard and aluminum cell lightning-arrester equipment. All the apparatus is housed in a substantial brick building 37 ft. 8 in. by 22 ft. 5 in. in size.

There is also mounted outside of this substation three General Electric H-60-100-kv.-a., 6600/440-volt, 60-cycle, single-phase, oil-cooled, step-down transformers. This apparatus is for use with the mine ventilating fan and to run the mine pumps in the central pumping station. The Hastie Run and Dixonville substations contain

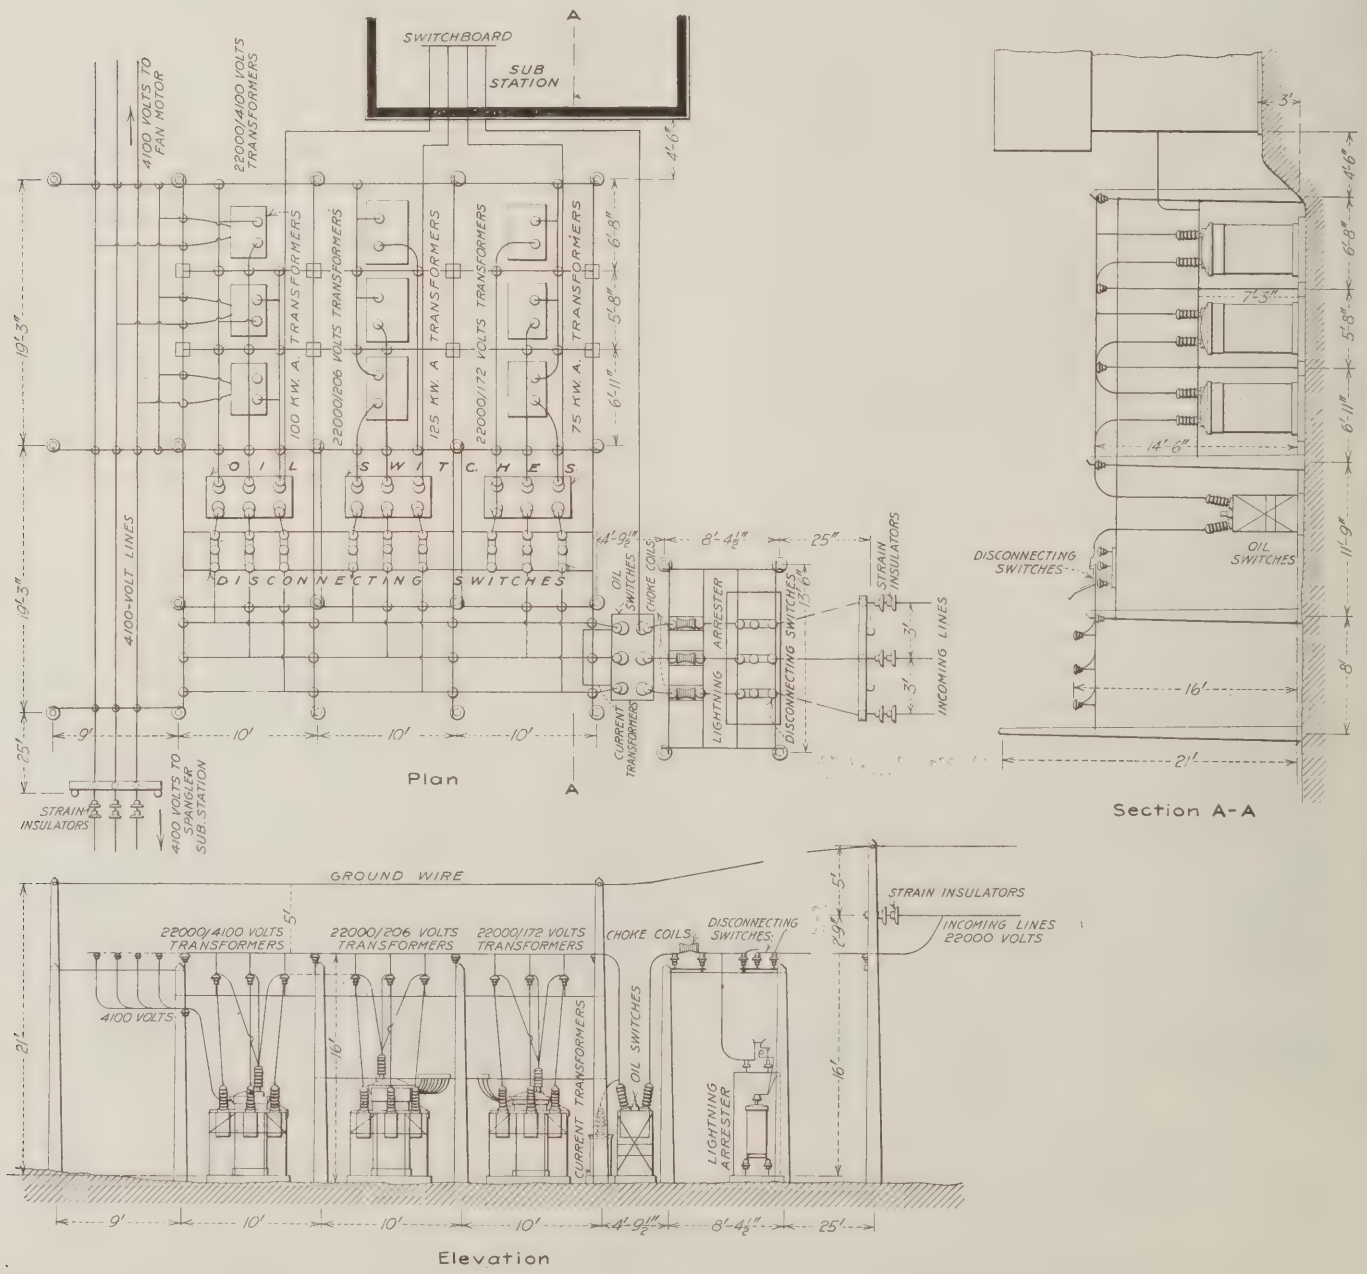

FIG. 13. DETAILS OF TRANSFORMER STATION AT THE WEST BRANCH SUBSTATION

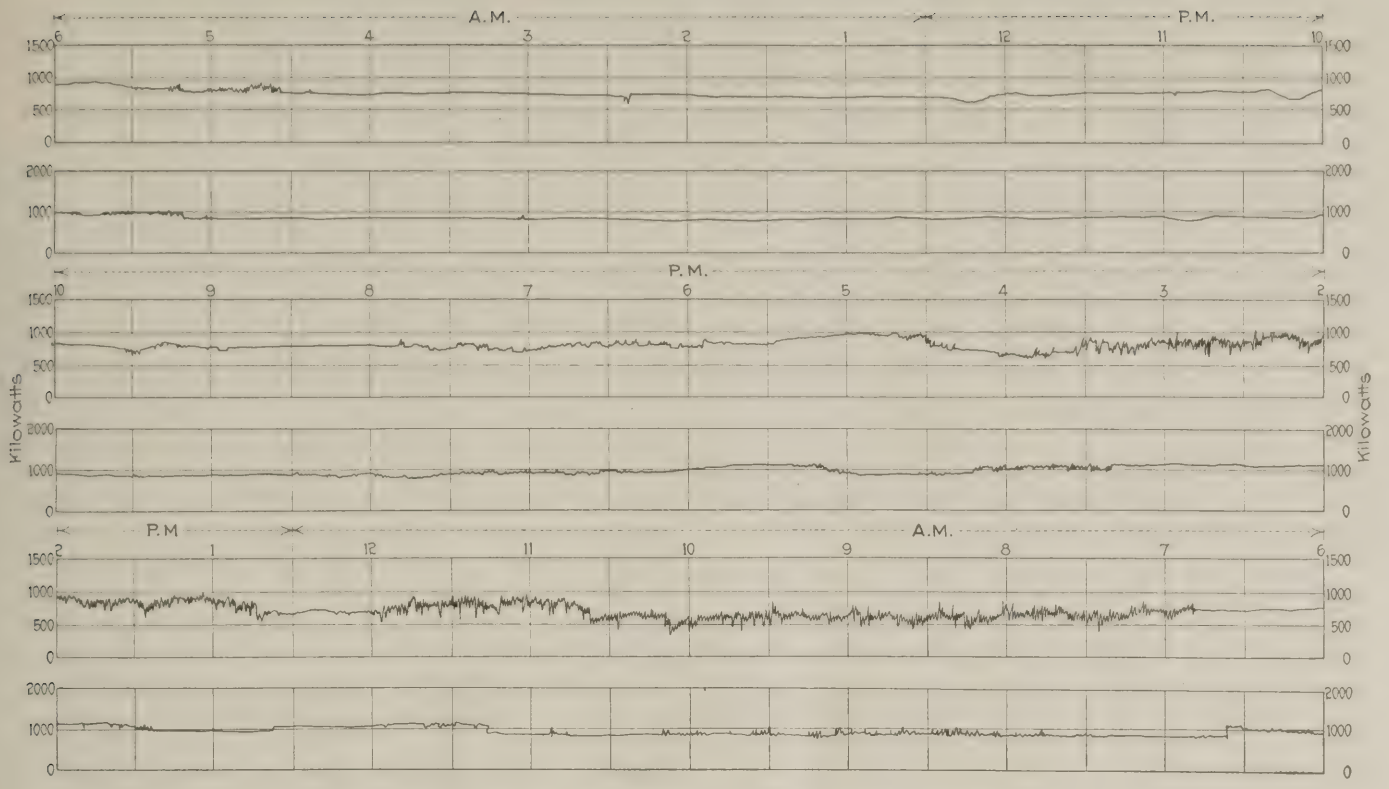

FIG. 14. CHART SHOWING LOAD ON POWER HOUSE

the same equipment, consisting of one General Electric TC-6-300-kw., 1200-r.p.m., 500-volt, compound-wound rotary converter with one bank of HJ-60-125-kv.-a., 6600/340-volt, indoor-type, oil-cooled transformers for use with this rotary converter, together with the necessary choke coils, disconnecting switches, switchboard and aluminum cell lightning-arrester equipment. The apparatus is housed in a brick building 27 ft. 8 in. long by 22 ft. 5 in. wide.

The substation equipment at the West Branch substation is exceedingly interesting, particularly the transformer station outside the building. In the substation proper, which is a concrete building, there is one General Electric TC-6-200-kw., 1200-r.p.m., 275-volt, compound-wound rotary converter, together with a switchboard and one HCC-6-300-kw., 1200-r.p.m., 275-volt, compound-wound rotary converter and its switchboard.

The transformer station is outside the substation, and for convenience, neatness and accessibility there is nothing left to be desired. The 22,000-volt current from the power plant comes in as shown in Fig. 13, and passes through a set of disconnecting switches. Just beyond these is the lightning arrester. The current then passes through the choke coils. From these coils it goes to an oil switch, which is operated by a pipe mechanism from a transformer switchboard in the substation building.

The 22,000-volt lines are carried along for an additional distance of 30 ft. This space is divided into three panels of 10 ft. each. In the first panel the line is tapped in parallel and the 22,000-volt current passes through a set of disconnecting switches and another oil switch operated from the transformer switchboard in the substation. Then the current passes through a bank of three General Electric HJ-60-75-kv.-a., 22,000/172-volt, 60-cycle, oil-cooled transformers to be used in connection with the 200-kw. rotary converter.

In the second section, or panel, the same arrangement of switches exists, but instead of the above transformers there is a bank of three General Electric HJ-60-125-kv.-a., 22,000/206-volt, 60-cycle, oil-cooled transformers used in connection with the 300-kw. rotary converter.

In order to take care of the equipment which was operated on a 4100-volt circuit from the old West Branch power house, and to save changing this equipment, a third set of transformers is placed in the third section, or panel. This panel has the same switch equipment and a bank of three General Electric H-60-100-kv.-a., 22,000/4100-volt, 60-cycle, single-phase, oil-cooled transformers. These transformers step down the incoming line voltage from 22,000 to 4100.

This 4100-volt current is used to operate the mine ventilating fan as well as a small substation at Spangler, which consists of a General Electric TCC-6-100-kw., 1200-r.p.m., 275-volt, compound-wound rotary converter together with the necessary transformers and switching apparatus.

The equipment at the West Branch substation is controlled on the 22,000-volt side by 22,000-volt oil switches of the outdoor type and mounted directly in back of the transformers (see Fig. 13). These oil switches, as well as the transformers, are protected by disconnecting switches, choke coils and aluminum cell lightning-arrester equipment.

The supports for holding the insulators for the transmission lines in the transformer station consist of wooden poles for uprights and 1¼-in. galvanized pipe for the crosspieces. These pipes are shown by the solid lines in Fig. 13. This figure also shows the general layout of the transformer station.

The arrangement of the equipment is such that it is absolutely unnecessary for a man to come near the high-tension current in order to throw a switch. The only time he would be required to approach the high-tension lines would be in the case of a breakdown.

At the present time there is a connected load on the power house through its various substations of 2000 kw., which could easily be handled with the present equipment. But this is not all the load that it has to carry, as it is furnishing from 500 to 1000 kw. to the Pennsylvania Public Service Corporation. In Fig. 14 is found the chart giving the output of the power plant. This is shown in the second, fourth and sixth lines. The first, third and fifth lines show the amount of current furnished the Public Service Corporation. The chart gives one full day's operation of the power plant and was taken on Dec. 6, 1917, commencing at 6 a.m. and running to 6 a.m. Dec. 7, 1917.

A study of these charts shows that the maximum power consumption of the coal company was at noon, when its current was being consumed at the rate of 400 kw.-hr., and for a few periods during the day, when as much as 600 kw.-hr. was consumed; but this did not last over two or three minutes at a time.

The power furnished the service corporation holds steady at about 700-kw.-hr. from 6 a.m. until 9:30 a.m., when it drops gradually to 600 kw.-hr., increasing then to 11 a.m., when it is drawing 900 kw.-hr. During the noon hour, as is to be expected, there is a marked falling off. This is likewise reflected on the chart showing the total output.

The consumption of the service company increases at 12:30 p.m. and holds steady until 3:30 p.m., when the mines on its lines begin to stop work and before the night load begins to come on. At 4:30 p.m. this load comes on, and from then to 5:30 holds at almost 1000 kw.-hr., when it drops to 800 kw.-hr. and keeps at this rate with hardly any breaks until the next morning.

During November, 1917, the power furnished the Pennsylvania Public Service Corporation amounted to 319,500 kw.-hr., whereas the coal company at two of its mines consumed only 86,900 kw.-hr. In November 603 tons of coal was burned to produce the 406,400 kw.-hr., requiring a little less than 3 lb. of coal for each kilowatt-hour produced. This is very good considering the fact that it was the first full month the power house had been operated and that all the firemen were green and unfamiliar with the mechanical stokers.

The average load on the power house is about 900 kw., and it runs as high as 1200 kw.; but it holds very even day and night with no marked peak loads. The power factor seems to vary somewhere between 85 and 90. Only one turbo-generator set is operated at one time.

During November, 1917, the West Branch substation was not operated, it not having been completed until Dec. 4, when it was turned over for the first time.

Carbon Coal Briquettes as a Substitute for Anthracite

The committee on minerals of the Canadian Conservation Commission has issued a report prepared by W. J. Dick, mining engineer to the commission, respecting the proposed production of carbon coal briquettes in the Western provinces. He finds that briquettes made from coal waste, or slack, which could be purchased cheaply at the mines, can be laid down at many points in the Prairie provinces at a lower cost than anthracite. He gives the following estimate of the saving which would result by the use of carbonized briquettes in place of anthracite in certain cities and towns in Manitoba and Saskatchewan, pointing out incidentally that the price of anthracite is likely to increase:

Portage la Prairie, nothing to 45c.; Carberry, 80c. to $1.30; Brandon, 85c. to $1.10; Virden, 95c. to $2.30; Moosomin, 95c. to $2.30; Wolseley, $1.45 to $1.70; Regina, $1.75 to $2.40; Moose Jaw, $1.70 to $2.50.

The report recommends the establishment of a plant at either Estevan or Bienfait with a capacity of 10 tons per hour to be operated up to half its capacity until the success of the undertaking had been established.

Unique Plan To Save Coal

In Albany, N. Y., recently, a conference was held by Governor Whitman and representatives of the State Grange, the Farm Bureau, the State Colleges of Forestry and the Conservation Commissioner, to discuss ways and means of saving more than a million tons of coal by the substitution of wood. In this connection an experiment recently worked out by Professor Mandenburg, forestry specialist of the Michigan Agricultural College, in conjunction with the agricultural agent of the G. R. & I. Railway Co. will prove of interest. It was demonstrated by these gentlemen that there was a large demand for stump wood in the larger cities of Michigan, especially Grand Rapids and Detroit, and that $2.15 per cord was offered for it by the dealers; that about three dollars' worth of dynamite would blast out and break up stumps containing an average of eight cords of wood.

There are many advantages connected with this idea. Merely cutting down trees and using the wood for fuel may take care of a present pressing need, but the practice represents an economic loss in the end; whereas clearing stump land represents an economic gain, because after the wood is burned there still remains the virgin farm land to be used in increasing the Nation's food products.

Using stump wood for fuel not only conserves coal but it relieves freight congestion and releases many cars at present employed in the hauling of coal. True, some of the stump wood would have to be hauled by rail, but such haulage would be purely local and probably most of it would be by team haul, whereas coal shipments frequently have to traverse several states.

The New York conferees estimated that the cutting of one cord of wood from each acre of farm lots in New York State would in itself save 1,125,000 tons of coal. If coal could be saved proportionately in other states, it can readily be seen that the coal conservation would foot up an immense aggregate and that railroad equipment that could be used for other purposes would be released to the extent of thousands of cars and many locomotives.

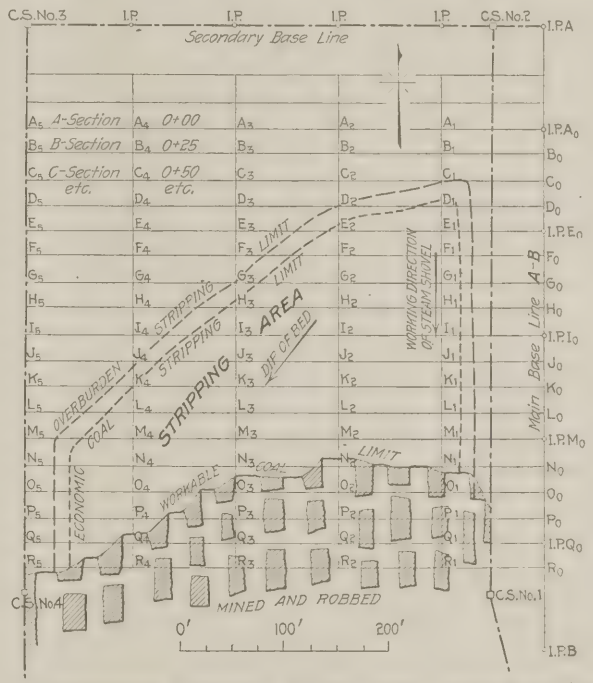
Library of Congress Wants Back Number of "Coal Age"

Any reader of *Coal Age* who has a complete copy of the Feb. 24, 1917, issue of this paper that he can part with, is urged to send it to Herbert Putnam, Librarian of Congress, Washington, D. C. The National Library desires to complete its files of our publication, and we are now out of print on this particular number.

Anthracite Coal Stripping—III

By THOMAS F. KENNEDY
Scranton, Penn.

SYNOPSIS — *The economic limits of the stripping are or should be systematically staked out in such a way as to facilitate cross-sectioning. Railroads, streams and certain other features on the surface must be amply protected from subsidence.*



HAVING established the economic stripping limit upon the plan, the next step in the problem is the staking out of the overburden limit upon the surface. Before the stakes can be set, several questions must be considered and definitely decided. The most important one is the method of the removal of the overburden. The nature of the overburden, the strike, pitch, drainage, topographic conditions, etc., must be studied thoroughly from the plan and cross-sections. If a steam shovel is to be used, the approximate path of the shovel should be traced by the engineer from the beginning of the removal of the overburden to the last cut upon the proposed stripping area.

To explain more clearly the establishing of the overburden limit, reference is made to a typical example shown on this page. Studying the plan, the working direction of the steam shovel is seen to be north and south. The primary, or main, base line is run approximately parallel to the path of the steam shovel; and a secondary line, used as a reference line, may be laid out perpendicular to the main base line. Assuming cut-stones of the property are upon the surface, the stripping limit is roughly laid out upon the ground, by a few stakes. The placing of these stakes gives the transitman in charge an idea of how far beyond the stripping limits the elevations should be taken. Referring to the diagram, it can be seen the east property line is practically parallel to the path of the steam shovel. The main base line *AB* is laid out as follows:

Set up the transit on the northeast cut-stone No. 2, backsight on the southeast cut-stone No. 1, turn an angle of 90 deg. east and set the iron pin *A* (1 in. in diameter and 3 ft. long) 50 or 100 ft. from cut-stone No. 2, the distance depending upon the topography of the surface. The transit is then set up on the iron pin *A*, backsighted on northeast cut-stone No. 2 and a 90-deg. angle turned to lay out the main base line *AB*, placing an iron pin every 100 ft., so that the line will be long enough to be used as a working basis for cross-sectioning the proposed stripping area.

The cross-section interval may be 20, 25 or 27 ft. The 20-ft. cross-sections develop comparatively accurate results, but necessitate more field and office work than the 25- or 27-ft. intervals. The 25-ft. sections produce practical results, with speed in the field and a reasonable amount of work in the office, while the 27-ft. cross-sections entail a large amount of computation in the field but facilitate calculations in the office. The 25-ft. cross-sections, which seem to be the most practical method in use, is preferred by the writer. Referring to the plan, stout oak stakes, 1½ in. square by 2½ ft. long, should be driven on the main base line every 25 ft. and lettered as shown. The cross-sectioning of the stripping area perpendicular to the path of the steam shovel furnishes more sections for monthly estimates of overburden removal than sections run parallel to the working direction of the shovel.

In marking the stakes there are several methods which give the required results, but a system should be used so that the work is reduced to a minimum. A method in practical use will be described briefly. The first section is known as the *A* section, or 0+00. Starting with the main base line *AB*, the first point and each succeeding 100-ft. point upon the cross-section is lettered A_0, A_1, A_2, etc. The second section is known as the *B* section, or 0+25. The 100-ft. points upon the section are lettered B_0, B_1, B_2, etc. The same principle

PLAN SHOWING METHOD OF STAKING OUT ECONOMIC COAL-STRIPPING LIMIT

applies to all the succeeding sections, and if the alphabet is exhausted, 1-*A*, 1-*B*, 1-*C*, etc., should be used. Each 100-ft. stake upon each section should be marked properly with blue keel, indicating the letter with its proper subscript.

In this system of marking stakes there are several advantages which will be discussed briefly. A point on any section is located with respect to the main base line and to the *A* or zero section. This being the case, the amount of descriptive matter marked upon the stake should be reduced to a minimum. The letter locates the cross-section from the zero cross-section, and the subscript locates the point upon the cross-section, from the main base line. The simplicity of using one letter with subscript enables the transitman to locate easily any point to the right or left of the stake upon the section. The fact that one letter is common throughout the section lessens the work in keeping notes. It does away

with the numbering of the section and distance from main base line upon the stake.

When all the stakes are placed upon the cross-section lines, the marking of the stakes should be checked and any errors in turning angles should be corrected. A spirit level should be used in taking elevations upon the breaks, which are located from each lettered stake by stretching a 100-ft. tape between the stakes. The nearest tenth in recording elevations upon the surface is close enough for practical purposes, while the thousandth of a foot should be considered in turning points and bench marks. Permanent bench marks should be established around the stripping so as to save time in field work when stripping operations and estimates are under way. The elevations should be plotted to a scale of 1 in. = 10 ft., vertical and horizontal, on a roll of cross-section paper, which will be described later.

The main base line and cross-section lines are plotted upon the stripping plan and the actual work of locating, or staking out the economic stripping limit upon the surface begins. The location of the overburden stripping limit depends upon the thickness of the overburden and the nature of the material which fixes the slope of the overburden excavation. By studying the map, the intersection, point *Z*, of section line *G* with the coal stripping limit line is determined by scaling the distance along the section line from a certain known lettered point *G*, upon the plan, and is located upon the surface by applying the scaled distance along the same section *G*, from the stake marked G_2. Other points upon the coal stripping limit are located in a similar manner.

Only Overburden Limit Is Staked

Knowing the thickness of the overburden and the desired slope of the overburden excavation, the overburden stripping limit is located upon the surface by computing the horizontal distance from the coal stripping limit. The overburden stripping limit is the only limit necessary to stake out upon the surface. Oak stakes 2 in. square and 3½ ft. long driven parallel to the direction of the slope of excavation should be placed about 50 ft. apart upon the overburden stripping limit line. The stakes should be painted red to distinguish them from other stakes and should project about 1½ ft. above the surface.

When the economic stripping limit is to be staked out upon the surface, property lines, railroad tracks and other surface not to be disturbed should be taken into consideration in keeping the excavation line a safe distance away from the foregoing features, so that slides, pulling in adjoining properties, railroads, etc., cannot occur.

The nature of the overburden generally fixes the distance. In case of clay overburden, the safe distance, in most instances, is the thickness of the overburden in the locality of the feature not to be disturbed, while with a rock overburden, about one-half of the overburden thickness is the limiting distance. Each problem has its own peculiar characteristics in arriving at the above solution.

Photographs are herewith presented showing the many features on the surface that must be protected. Fig. 1 shows a portion of a stripping adjacent to a cemetery, which is protected by an embankment about 20 ft. in width, with a slope toward the stripping proper. The overburden consists of about 15 ft. of clay with about 15 ft. of solid rock. This embankment left in place prevents any sliding of the cemetery surface into the stripping.

In Fig. 2, the high clay bank left in place in the distance protects an adjoining railroad from undergoing any disturbance. The overburden consists of 35 ft. of tough gumbo clay, while the railroad is located about 30 ft. from the edge of the overburden excavation.

Referring to Fig. 3, the bed of a creek and its protective embankment are seen in the foreground, with the stripping about 40 ft. away in the distance. The bottom of the creek is about 14 ft. from the surface, but the barrier in this case was increased in width, to prevent any leakage of water into the stripping. The overburden consists of 30 ft. of clay.

FIGS. 1 TO 3. KIND OF SURFACE THAT MUST BE PROTECTED

Fig. 1—Portion of stripping adjacent to cemetery, protected by an embankment to prevent cemetery surface from sliding into the stripping. Fig. 2—High clay bank in background protects adjoining railroad. Fig. 3—Bed of creek and its protective embankment in foreground; stripping about 40 ft. distant.

This phase of the stripping problem is very important, and if disturbances to adjoining properties occur, the operators of the strippings are liable to damages.

(To be continued)

Electric Lamps in Nongaseous Mines*

By GEORGE H. DEIKE
Pittsburgh, Penn.

SYNOPSIS — *With water tunnels, copper and salt mines developing explosive qualities, who is going to define any mines as unquestionably nongaseous? Mine-safety and sanitary reasons for installing electric lamps in all mines, gaseous and nongaseous, and two additional reasons to clinch the argument in case of gaseous mines. According to the author, fussing with oil and carbide lamps consumes 30 to 55 min. per shift and reduces the loader's output 35 per cent. Insurance earnings on electric lamps will pay about 18 per cent. on the money invested in them. Electric lamps cost roughly a half less to maintain than oil or carbide lamps.*

THE attribute "nongaseous" as applied to a mine is a time-honored and battle-scarred expression. As a safety engineer with several years of experience I have been led to the conclusion that no underground operation should be designated "nongaseous." To do so would be to forecast the future of the operation and to base it upon the past record of those particular workings.

By several gas explosions occurring in mining operations that supposedly were quite unlikely to encounter gas accumulations, we have, during the past 12 months, been forcibly reminded of our inability to classify mines as gaseous and nongaseous. Among these might be mentioned the gas explosion in the water tunnel being built under Lake Erie for the city of Cleveland, the gas explosion in a copper mine in Michigan and the more recent gas explosion in a shaft near Ithaca, N. Y., which was being sunk to a bed of rock salt. If operations of this character are to come under gaseous operations, previous classifications must be revised.

The accident in the Cleveland water tunnel occurred when a blower of gas was encountered at the face of the workings about 120 ft. below the water surface and 60 ft. below the bed of the lake, at a point about five miles from shore, 23 men losing their lives as a result. After this explosion a safety engineer and three certificated firebosses were placed in charge of the work, permissible electric cap lamps were installed, and the remaining 1400 ft. to connect the two tunnels was completed without further difficulty.

The Michigan explosion occurred early this year in an old copper mine which was being pumped out and reopened. The workmen were using carbide lamps when explosive gas (methane) was encountered, resulting in a severe explosion and the loss of two lives. The work of reopening this mine was subsequently completed by the light of electric cap lamps, Koehler safety lamps being used for gas in testing. This is a forceful example of the unexpected occurrence of explosive gas in a metal mine.

The explosion in the shaft near Ithaca, N. Y., resulted from gas accumulations encountered at a depth of about 830 ft. The bed of rock salt, to which they are sinking, lies at a depth of about 1600 ft. This shaft was within 200 ft. of Lake Cayuga, and yet the intervening rock was so impervious that there was absolutely no seepage and in order to operate the rock drills it was necessary to pipe water down from the surface to the foot of the shaft. After the explosion firebosses were employed and a complete equipment of permissible electric cap lamps was installed so that the work of sinking could be carried on in safety.

In all three cases no one expected to encounter gas, and at the time the accidents occurred there was no one in charge who had the knowledge necessary to take care of it. These operations belong to such a category that the public and managers do not give the subject of the presence of gas even a passing thought. No mines or tunnels of the character named are anywhere labelled "gaseous," yet outbursts of like character have occurred in such workings before.

In a communication from Frank Haas, consulting engineer, Consolidation Coal Co., Fairmont, W. Va., he says: "The finding of gas in salt developments is not, however, an unusual occurrence, as they have invariably had considerable trouble from this source in the salt mines of Germany. We also find similar conditions in the clay mines of Ohio, also in limestone quarries, and in such shallow operations as cisterns in northern Ohio."

Must Revise Definition of Gaseous Mine

The possibilities of gas emanation having been brought to our attention by the unfortunate accidents already referred to, it becomes necessary for us to revise somewhat the definition of a gaseous mine. That definition is indicated by the fact that in all the accidents enumerated the gas found was pure methane. Chemical analysis proved that no other hydrocarbons were present. Gas will be found in pervious strata wherever there has been decomposition of carbonaceous material in the vicinity. To make such a pervious bed a reservoir for gas accumulations only requires the presence of overlying impervious strata. A condition such as this may exist in strata far removed from any coal measures.

In coal-mining operations coal seams usually act as reservoirs for gas. When the coal seam is below water level the gas is retained in the crevices of the coal. An impervious rock stratum will prevent the escape of the gases even when the coal seam is above water level. Gaseous conditions may likewise be found in metal mines or in any underground operation if a carbonaceous stratum or any carbonaceous material is present, and if a porous or open container and some nonporous overlying strata are conveniently located. The fact that gas is encountered more often in coal mines than in metal mines or other operations does not indicate that the gas always comes from the coal itself. The coal, owing to its open character, can readily become a reservoir for the gases that originate in the carbonaceous

*Abstract of article read at the New York meeting of the National Safety Council, Sept. 10-14. As delivered the title was "Advantages in Use of Permissible Electric Lamps in Nongaseous Mines."

shales usually found in close proximity to the coal seams. The Bureau of Mines has approved six electric lamps for use in mine workings. Among these is the Edison electric cap lamp. During the 2½ years since this approval was granted over 90,000 of these Edison cap lamps have been put in operation. These lamps replace about equally flame safety lamps and open lights.

The main advantages of the electric cap lamp as regards safety and sanitation may be enumerated as follows: (1) Reduction of gas-explosion hazard; (2) reduction of hazard of gas burns; (3) reduction of mine-fire hazard; (4) reduction of the number of accidents from falls of roof, rock, ore, etc., owing to the illumination being more uniform and adequate than with some illuminants; (5) reduction of the number of haulage accidents owing to the illumination being more dependable; (6) reduction in the number of accidents in the handling of explosives; (7) reduction in the fire risk in breakers, tipples and headframes; (8) increase of opportunity to escape following explosions or heavy falls; (9) elimination of the burns caused by open lights; (10) elimination of nystagmus or eye strain; (11) reduction in miners' asthma and tuberculosis.

It will be noted that this list of advantages except the first two items applies to *all* underground operations. The first two are applicable only to mining operations in which explosive gas occurs, though we must all acknowledge our inability to determine in advance the possibility that explosive gas will occur in any underground operation.

Open Lights Responsible for Many Accidents

In reference to the advantages outlined the following brief remarks may be made. Statistics show that about 85 per cent. of all gas explosions are started by open lights. Thousands of miners burned by gas every year are object lessons of the danger of the open light.

The great loss of life and destruction of property at the Cherry mine fire, at Cherry, Ill., in November, 1908, resulting from an open-flame torch coming in contact with inflammable material, well exhibits the importance of using lamps which will not ignite inflammable material. The fire in a metal mine near Butte, Mont., also proclaims the same lesson. At this mine 168 men were suffocated in the fire which resulted when an open lamp came in contact with the insulating material of a torn electric cable.

In regard to the reduction of accidents by falls of roof and coal it may be said that one large coal-mining company furnishes data that indicate a reduction in accidents of 41 per cent. from the above causes during the first year electric cap lamps were in service.

With reference to the hazard of haulage accidents it may be said that many hazards of haulage are really hazards of inefficient illumination. A man loses his light from one of several causes and as a result he is run down by a trip, is caught between cars and crushed or is crowded between the cars and the ribs or the roof. Again, high-velocity air currents, windy shots, bumps and concussions often leave not only the driver, motorman and triprider in the dark, but the miner likewise. The light from an electric cap lamp which is not extinguished by any of these causes will protect the mine worker from the hazards resulting from an extinguished lamp.

After many of the great mine explosions in this country, many lives have been lost owing to the fact that all lights were extinguished or blown away by the force of the explosion, and the surviving miners had no light by which to direct their escape from the deadly afterdamp. When equipped with permissible electric lamps the entombed men have a chance of escape as long as they have their lights with them. This fact was practically demonstrated in an Alabama mine in 1914, when men wearing electric cap lamps were able to escape following an explosion. Other men wearing open lights in the same section of the mine were lost, owing to their lights being extinguished.

The open-flame lamp, either of the oil-burning or the carbide type, requires frequent attention and adjustment throughout each shift in order to keep anything like a regular length of flame and to provide the lamp founts with oil or carbide and water. From tests made in practical experience it is found that from 35 to 55 min. is required by each employee in each eight-hour shift to keep his open-flame lamp adjusted, and even with such time-consuming attention the variation in candle power was so large as to greatly reduce the efficiency of the workmen.

Use of Electric Lamps Increases Output

Where permissible electric lamps have been in continuous daily service for a period of 30 months a greatly increased tonnage per miner is obtained which is rightfully attributed to the better illumination. The increased tonnage from this cause has been estimated at 35 per cent. In these days, when the shortage of labor is reducing the mine output materially, any change of equipment which will permit the daymen to save 30 to 55 min. per shift and which will increase the loader's output 35 per cent. should be adopted as quickly as possible.

To measure the time saved with electric lamps we have but to follow through the operation of a working shift. The mine worker calls at the lamphouse and is handed his complete lamp, locked, fully charged and burning. He places the battery on his belt and the lamp on his cap, and enters the mine to his place of working. The light is sufficient for all working purposes, properly and equally distributed, and does not change in intensity, so that his work proceeds without any interruption from that score, and he completes his shift without the necessity of giving any thought or attention to his lamp. After the day's work is completed he returns his outfit to the lamphouse to be recharged overnight. He had handled his lamp only twice during the day, to put it on and to take it off at the lamp shanty. From the standpoint of efficiency such a procedure cannot be surpassed.

The maintenance of oil and carbide lamps costs from 6 to 7c. per shift. Where sperm candles are used the cost per shift is approximately 7 to 8c. Locally these figures may be exceeded owing to unfavorable conditions. From detailed reports of two years of operation it is shown that the average cost of operating electric cap lamps does not exceed 3½ to 5c. per shift. In these figures is included the original cost of the installation, all repairs, the interest on the investment and other charges. This shows a saving of from 1 to 3c. a lamp per shift to the party who pays the bill, and the savings

accumulated will quickly mount to a convincing sum. Where the standards of the Associated Companies have been adopted the installation of safety devices of all kinds put into effect preferential rate discounts on premiums paid for workmen's compensation insurance. The insurance saving obtained by introducing permissible electric cap lamps into a mine represents a saving of about 18 per cent. on the original investment. The reduction in the premium per $100 of payroll for permissible electric cap lamps in cents is as follows:

Coal Field	Nongaseous Mines	Gaseous Mines	Coal Field	Nongaseous Mines	Gaseous Mines
Anthracite:			Bituminous:		
Pennsylvania...	11	17.5	Indiana.....	11	15
Bituminous:			Colorado.....	13	22

Illinois.....	13	17	Iowa.....	13	15

This schedule applies only to coal-mine operations.

Northeastern Pennsylvania Engineers Have Big Banquet

SPECIAL CORRESPONDENCE

The Engineers Society of Northeastern Pennsylvania met at the Hotel Jermyn, Scranton, Penn., under the shadow of the recent order of the Fuel Administration for restricting national industry. The talk in the foyer was all about the national holiday of five consecutive days and of the nine blue Mondays to follow. None seemed to be impressed with the necessity for the Garfield sabbaths. Certainly it seemed that it was ill advised to apply such an order to Scranton, where the coal comes in by wagon or motor truck, and where the railroads do not handle the coal that is consumed locally.

There is no lack of coal, so why restrain, argued the guests, the production of manufactured articles? If the railroads can't handle that product, then let it remain on the premises; if the manufacturer can't run unless he receives raw materials by railroad, or is unable to store his product, then and then only let the plant shut down; but it is unnecessary to close the plant to save the railroads from a glut of transportation when the plants can be run without using that transportation in any way whatever. Nor is it necessary for anybody in offices to go cold when there are men to mine and clean coal, and inadequate facilities for the shipment of the coal by railroad, and where there is ample opportunity to "motor-truck" coal to the office buildings.

The Delaware & Hudson Co.'s mines were complaining of an entirely inadequate car supply. The management is piling coal on the ground in the hope that the railroads would some day be able to furnish the mines with adequate transportation, though the date seemed far off and the prospect doubtful. This reloading will cause mechanical, labor and degradation losses, but the Delaware & Hudson was prepared to risk these for the public advantage, and in order to prevent their men from leaving for other mines and industries. The manufacturers should be allowed to make and store up manufactured articles in the same way in which the D. & H. is allowed to store up coal.

It seemed to many that companies with stocks of coal might just as well work full force till their coal was depleted or their storage rooms glutted. It might be well, they argued, to refuse to replenish the stocks of fuel of the manufacturer till the greater needs of others were filled. But to make them hold the coal needlessly was held to be unjustifiable. If they have more than they should have, then perhaps it could be reasonably taken from them by wagon or motor—not of course by railroad. To forbid them and everybody else the use of that coal for five or more days did not commend itself to the public as a politic course.

There was our friend Hamilton from Carbondale, Penn., with orders for colliery stacks and colliery screens. He rightly said that the mines must get that material from somewhere, or the coal production would not be forthcoming when it was needed. Much of his manufactured material can go out by motor truck or by wagon; all his coal is brought in from a culm dump in like manner. Why, then, close his plant down when it has no relation in much of its product or its fuel to the plight of the railroads? Why not let him work while he can?

Rufus J. Foster said the International Correspondence School was printing courses for men in the army, using for power mainly exhaust steam from a public service corporation. Surely it is better to work than to waste the low-pressure steam, which the corporation is not equipped to use, and as senseless to make restrictions of this kind as it is to require a lightless night in a town with an excess of electric power derived from a head of water.

Of course, the coal men lacked no word of loyalty. In fact loyalty was the keynote of the objection. When they felt their ability to help, it hurt to have their opportunity thwarted by an order which did not give due consideration to all the elements in the problem.

In view of the intense interest manifested in the conversation of the foyer, it seemed a pity that a clearing of the decks could not be made for a heart-to-heart discussion of the whole subject. Of course, there were side lines into which the discussion drifted. Most of the coal offices around the country, it was said, would have to be closed during the enforced Monday vacations, but as most of the executives in the anthracite region are quartered in railroad buildings the restrictions do not promise to keep the rooms of the coal companies in a state of frigid discomfort.

The menu at the banquet consisted of the following:

	Calories		Calories
Blue Point cocktail.....	50	Individual tenderloin	350
Celery	10	Mashed potatoes	100
Olives	10	French peas	75
Radishes	10	Neapolitan ice cream.....	200
Vegetable soup	75	Fancy cakes	150
Dinner rolls	150	Coffee	25
Butter	100		
Boiled halibut	125	Total	1530
Lemon butter	100		

E. S. N. P. General Orders No. 1—Penalty for exceeding the above-mentioned calorie equivalent, one year in the guardhouse. E. S. N. P. No. 2—Penalty for not fully utilizing the above-mentioned calorie equivalent, malnutrition and slow starvation.

Peter Rimmer, genial master of ceremonies, had registered a vow to make it an "eatless" banquet as far as he himself was concerned, and he nearly succeeded in separating the other guests from their meal by his energetic and megaphonic encouragement to them to "Sing, sing, sing." And sing they did, though the Canadian anthem troubled them not a little. Lieutenant Colonel Powers laughingly said it was "damnably sung," but then he added: "It was your enthusiasm ran away with you. You were just two bars ahead of the music." It was a lively "jazz band" from Wilkes-Barre that fur-

nished the music. They kept up the spirits of the banqueters and made so much noise that you couldn't hear yourself eat.

The following officers were named for the coming year: Malcom E. Walthall, president; H. A. Smith and Hugh A. Dawson, vice presidents; T. F. McKenna, secretary and treasurer. After toasts to the President and the Allies, Lieut. Col. T. E. Powers, with apologies for speaking on a military subject, discussed the work of the Royal Canadian Engineers. He said that the British army did not favor deep dugouts, the entrances to which could readily be bombed and the occupants smothered. Instead they cut slit trenches off the communication trenches long enough to hold a dozen men. When it was necessary to retire from the main trench of the front line, as was often the case, the slit trench was the place chosen for refuge. As soon as the bombardment ceased the men could resume their positions in the main trench and repel invaders. The speaker said the Germans today were using immense entanglements of barbed wire, three lines of wire each 33 ft. wide being placed in front of the trenches. The British lines are not so liberally protected, as an army's entanglements prevent its own advance as well as the advance of the enemy, and the British are always anticipating a forward movement of the troops. Dr. W. P. Mason, professor of chemistry, Rensselaer Institute, Troy, N. Y., described an explosion of a septic tank having 4 compartments 90 ft. square. The roof lifted was 12 in. thick and was composed of reinforced concrete. Dr. Mason said the methane given off by the sewage was undoubtedly the cause of the explosion, but he questioned how it was ignited. The caretaker had been over the tanks just before the explosion, but he was telephoning at a distant point when the tank let go. So he could not have been the cause of the ignition.

Dr. Mason said that bubbles of phosphine (PH_3) often escaped from sewage, and on reaching the surface they would automatically burst into flame. It is true that phosphine is not spontaneously inflammable, but P_2H_4 is. This liquid hydride is always formed and is thrown into the air with the phosphine. The processes which form ammonia (NH_3) are quite apt to forms its analogue, PH_3, not much, it is true, but enough to start an explosion of methane and air. The solution given is one little comforting to mining engineers as it is just possible that phosphine might be formed in the mines; if not from coal, at least from sewage. Maj. M. S. Boehm, of the 169th Battalion, Canadian Infantry, was the principal speaker in the evening. His forbears came from Lancaster County, Pennsylvania. Major Boehm exhibited some marvelous pictures taken by the Canadian Government of the fighting at the front, showing barrages, and men going over the top, and distressing pictures of "No Man's Land," ruined towns and desecrated cemeteries. Major Boehm said that the Canadian troops did not believe they had in any way excelled their British fellow soldiers. He declared the stories that it was Canada that was doing the fighting and that Great Britain was hanging back were German propaganda and deserved vigorous denial. His remarks on the coal being shipped from the anthracite region received lengthy editorial comment last week. As Major Boehm's address was important and well received, a few of his statements may be repeated. He said:

One of the questions I am frequently asked is when will the war be over? I would not be foolish enough to give the question an official answer. Personally I think the end is not in sight. As far as I have gathered from observation and reading, there is no evidence that the war is approaching an end.

Another question also that is directed at me is as to whether the Germans realize that they cannot win. They do not realize it. They are out to win and they hope to win, and we must make sacrifices such as the German people are making if we hope to win the war. The Germans now possess twice as much territory as they had when the war began. Figuratively speaking, not a shot has been fired on German soil during the war. There will come a day when Germany will begin to realize that she cannot win the war, but even then she will go on fighting.

Germany looks back at 1917 and sees Russia out of the war and Italy not yet recovered from the staggering blow

delivered by the invaders. She recalls that Belgium, Rumania, Poland and Serbia have fallen into her hands. So she has every reason to believe that she can win. The only reason we say Germany can't win is because *we* do not dare to lose.

This great nation is getting into the war in the proper spirit. It is spending thousands of millions of dollars for training purposes, for armies and strengthening the navy. But the war is in Flanders and your men are here. How are you going to get your men to Flanders? Do you know that it would take three years to carry across the ocean an army of 1,500,000 men if a boatload of soldiers was sent across every day?

It seems to me that the one thing essential right now is the building of ships. Work the shipyards 24 hours a day, with the maximum amount of men, and then triple your shipyards. There is a crucial situation here. I have never seen a better bunch of men than the soldiers you now have in training. But the place to fight the burglar is on the lawn before he breaks into the house, and the war is being fought in Flanders. You must arrange to get them there."

Major Boehm read a letter from Charles F. Winter, Minister of Militia and Defense in Canada, in which the writer said that up to Sept. 30, 1917, out of a population of about 6¾ million, 333,313 men had been sent overseas to take part in the war.

The casualties to the same date were: Killed in action or died of wounds received in action with the enemy or "presumed dead," 31,394 of all ranks; in addition, died of disease, 1514; wounded, 87,657; missing, 1298; prisoners of war (Major Boehm said most of these were men gassed at Ypres), 2580. The total casualties up to Sept. 30, were 124,443. The total number of recruits in the Canadian Expeditionary forces who gave their birthplace as the United States or claimed to be American citizens living in Canada was, to the same date, 7793.

The total contributions in Canada to the Canadian Patriotic Fund up to Oct. 30, was $30,863,338.58. This shows how Canada is dedicating herself to the war. Only 250,000 of the 333,313 men reached the front, as many under trial were found unfit. Almost half of the acceptable men have since appeared on the casualty lists. It is interesting to add that 430,000 men volunteered, or one man in every fifteen. It will be noted how small is the record percentage of non-Canadian soldiers enlisted in the forces of the Expeditionary Force.

It may be added that 37 members of the Engineers' Society of Northeastern Pennsylvania are now in the United States service, the outgoing president, Frank J. Duffy, being now at Fort Hancock, Georgia.

Rocky Mountain Coal Mining Institute To Resume Activities

At the last meeting of the Institute, which was held June 18, 19 and 20, 1917, at Glenwood Springs, Colo., it was decided to postpone any future meetings indefinitely during the continuance of the war, unless the Board of Directors should decide that it is to the best interest of the association and its members to call a meeting at an earlier date.

It now appears that practically all the large scientific and engineering societies are continuing to hold their meetings, as many subjects are coming up that require discussion, and the Rocky Mountain Coal Mining Institute has placed the matter of resuming its activities before the Executive Committee. That body will submit a report in a short time, and the Institute membership will receive due and timely notice thereof.

"Coal Age" Indexes Now Ready

Indexes to *Coal Age* are furnished free to all who ask for them. The index for the last half of 1917 can now be obtained by addressing a request for one to the subscription department of *Coal Age*, New York City.

American Coal Trade Shows Increase

Out of a total of 1,024,487 tons of coal imported into Brazil during 1916, the United States supplied 814,212 tons, the remainder being furnished by Great Britian. Since the outbreak of the European war and the British trade restrictions on Welsh coal, which formerly monopolized this market, American coal has gradually been finding a foothold in Brazil. This remarkable increase in the coal trade with the United States, however, must be attributed almost entirely to the abnormal war conditions. American coal interests have failed to follow their British competitors in establishing local coal deposits, or yards, and have sold their coal in lots of almost any size for ready money whenever the occasion arose. With such methods as these the business will probably not have a very permanent foothold when the British restrictions are relieved.

Some Do and Some Don't

By H. S. Salmon
Chief Mine Inspector, Tennessee Coal, Iron and Railroad Co., Bessemer, Ala.

"There's miners an' miners," sez Foreman Bill,
As he tamped tobacco in his old corn cob.
"There's them that won't an' them that will,
An' ye'll find both kinds on this here job.
Ye'll wanta know, if ye're a thinkin' man,
Jest what I means by the "will and won't."—
An American miner helps all he can,
An' a lazy, shackin' slacker don't.

"A dog-gone slacker—dern his hide,
'U'd look like a German if ye saw inside,
Fer he won't work reg'lar fer anyone,
An' our boys can't fight ef the mines don't run.
Whenever he lays out of his place fer a day,
The Kaiser rests easy when he hits the hay.
They're careless, too, when they do make a shift,
An' if one gets hurt that's a heap of a lift
Toward helpin' the Germans hold their line;
But a miner that's up in the hospital won't
Help us much toward crossin' the Rhine.
Do you see what I mean by "Some do an' some don't"?

"An American miner ye'll find true blue,
Ef ye cut him open an' look him through.
He'll work every day to get out the stuff
To help our boys call the Kaiser's bluff.
He knows when he shacks without any cause,
That the Huns take a drink to him in applause.
He watches close that a rock don't drop
An' send him up with the slackers on top;
Fer he's down there with his shovel an' drill,
Doing what a slacker could be doing but won't.
He is the man who can help win and will.
Now you see what I mean by "Some do and some don't."

Nineteen thousand acres of land in the Nenana coal field of Alaska have been divided into blocks and will be offered for lease by the Interior Department in the near future. That portion of the field which is the more accessible has been surveyed and divided into leasing units. These units which range from 160 to 1664 acres have been arranged, it is believed, to permit of the most economical mining.

Reclaiming the Culm Pile

By G. D. EVANS
Pottsville, Penn.

SYNOPSIS — *Considered an eyesore and of no value whatever as marketable fuel, the many culm banks in the anthracite fields are now being sent to market. A brief description is given of one of the many plants that are now shipping this product.*

NO LESS than 15 per cent. of the anthracite coal going to market today is being recovered from culm banks. In years gone by the visitor to the anthracite coal fields, on noticing these huge, unsightly black heaps, would question whether they ever would be used. Usually, the answer was, "Probably some time." This time has now come, and these culm piles, great and small, which for years have been eyesores to the communities resting within their shadows, are the source of much of the power and energy of the country. Were it not for the coal being recovered from these banks, the present coal shortage would be even more serious than it is.

Until a few years ago, the prices for the steam sizes of anthracite were so low that these sizes were regarded by the coal companies merely as a byproduct. They were shipped to market only because the coal had to be handled in the breaker with the prepared sizes, and it paid better to ship them at almost any price than to store them. At times, there was positively no market for No. 2 and No. 3 buckwheat, and therefore hauling away from the breaker and storing became necessary.

Some years ago, the companies began to turn their attention to the banks which had been dumped in the early days of mining at points handy for loading and transporting to an operating breaker. By means of this extra coal handled at a low cost per ton, breakers at mines which had fallen off in production of fresh-mined coal were kept running at full capacity.

When, a couple of years ago, the demand for steam sizes began to grow in leaps and bounds and to set a price for these sizes which made it possible to prepare them at a fair profit, corporations and individuals began to turn their attention to the banks. Washeries began to spring up wherever there was a bank large enough to warrant the erection of an operation. Now some washeries are shipping 50 tons a day, and others are producing as much as 2000 tons in a day. Many banks are being loaded into railroad cars and shipped without any preparation, though most of this coal is mixed with run-of-mine bituminous for steaming purposes.

There is an idea prevailing that this bank coal, having been released from its natural bed underground and deposited for years on the surface, has deteriorated in heat value; but analyses show practically no loss in fixed carbon or B.t.u.'s. If prepared with the same care as fresh-mined coal, its heat value is essentially the same.

One of the largest shippers in the anthracite field, producing bank coal only, is the Ashton Washery of the Lehigh Coal and Navigation Co., near Lansford, Penn. This plant was built for a daily production of 1200 tons and has shipped as much as 58 cars, or 2300 tons,

a day. It is equipped with the most up-to-date machinery for moving the bank and cleaning the coal, and is sending to market a carefully prepared product.

The bank is loaded into steel dump-cars by two steam shovels, a Marion model 70 and a Bucyrus 70 C with 2¾- and 2-yd. dippers respectively. The dump-cars are Clark Car Co. latest type patent automatic dumps, built by the Cambria Steel Co. They are of standard gage, with a capacity of 810 cu.ft. The leading illustration shows the Bucyrus shovel.

The cars are hauled by two 60-ton locomotives to a point directly back of the center of the breaker, or washery, and the contents dumped into a chute leading to a gunboat pit, as shown in Fig. 2. The material is hoisted by the gunboats up a double-track plane to the tower and dumped into a hopper chute from which it is regularly fed to a bull shaker by means of a drop gate operated by a steam-driven piston.

Operating the gunboats are a pair of 36 x 60-in. Vulcan engines equipped with steam brake, steam reverse and Roybel safety overwind devices. There is also installed a Strong, Carlyle & Hammond emergency throttle closer. The breaker machinery is driven by a pair of 22 x 42-in. engines, connected to the main shaft by a 36-in. belt.

An electric motor is now being installed to take the place of the breaker engines, and an idea of the economy of the proposed change can be obtained from the photograph of the washery partly hidden by the exhaust steam from the breaker engines (see Fig. 3). The methods used in the preparation of the coal are about the same as those adopted at most modern breakers. The washery is equipped with the usual shakers and rolls and 16 jigs of the Elmore and German types. One of the unusual features is the jigging of No. 2 buckwheat or rice coal.

FIG. 3. ASHTON WASHERY, LEHIGH COAL AND NAVIGATION CO., LANSFORD, PENNSYLVANIA

This washery does not handle any fresh-mined product in the material passing over the bull, or lump, shaker; there is therefore only a very small proportion of coal, the little there is being picked from the rock and slate by two men and sent to the main rolls. The

FIG. 2. CLARK CAR CO. AUTOMATIC DUMP CAR, HAULED BY A 60-TON LOCOMOTIVE

rock and slate is allowed to pass on to a rock conveyor line. The broken coal is also picked from the refuse of that size and goes to the rolls, while the rock and slate passes on to the rock line, which empties into a hopper. From the hopper, the rock is loaded into the same make dump-cars used to transfer the material to the breaker and taken by another locomotive to the rock bank.

From the main shaker and rolls, the coal goes through the usual methods of preparation until it reaches the pockets, which, contrary to the customary plan of breaker construction are set parallel with the depth of the breaker, or at right angles to the loading tracks. The coal is carried from each pocket to the railroad car by a single belt conveyor. Thus one car must be completely loaded before another is started. The cars are run to and from the loading point by an endless rope system instead of by the usual gravity method. An idea of the efficiency of this plan can be gained by the fact that 58 cars have been loaded in eight hours.

Minecdotes

Educating a Layman

Jack Richards and Bill Jones were a pair of unregenerate shotfirers in Northwestern Colliery No. 8, at Bevier, Mo. Over at Macon they had a newspaper friend whose lack of knowledge about the underground world was pitiably plain in every mine story he wrote. So they decided to "educate" him. Telephoning him to come over one day to get a big story, they encased him in pit clothes and gave him a lamp that looked like a baby teapot. Two other shotfirers—John Ramsey and Ben Evans—joined them, and the scary-looking cage lowered the five to "somewhere in the bowels of Mother Earth." Along the double-tracked entry the walking was good. The tenderfoot brightened up.

"It ain't so bad," he bragged.

"Huh!" from Jack. By the pit lamp's glow you could see his right eye close and open.

There came a place where Jack turned and went through the solid wall. It looked that way. They said it was a cross-entry. It was a little larger than a cracker box, and had two narrow strands of rail on the bottom of it. The ground began to get moist. The tenderfoot remembered bitterly ten cents invested in a shine that day. Soon he had bigger troubles than that. The timbers across the low roof played a rat-a-tat on his skull, no matter how he ducked. There was a black object ahead. Some miner had pushed a carload of coal out in the entry.

"Let's turn around and go back," suggested the tenderfoot.

Jack's face wrinkled with delight. Bill shot himself over the car and bawled to Jack: "Hist him up!"

Jack threw the head end of the visitor on the heaped-up coal car and Bill grabbed his hands. The two of them slid their unhappy friend across the coal. He felt like a mogul engine bumping across a cobble-stone street. There wasn't a spot about him his best friend would have recognized, nor that didn't hurt.

Jack went off into the blackness to one side. Then he came out and the little party continued its course. There was a mighty detonation to the rear, a broad red flash and a crash. With it came a fearful rush of wind that blew out the layman's lamp and sent his hat somewhere.

Meanwhile Bill was darting in and out of the darkness, and in his wake came the boom of the big cartridges and the sudden impact of tornadoes and cyclones.

"Come!" commanded Jack, grasping the tenderfoot's hand. "It's your turn."

They squeezed through between a loaded coal car and the neck of the room, a space so narrow that it would have taxed the skill of a cat, and holding up his pit lamp, Jack pointed to two sinister looking objects that resembled the mustache of a Mongolian pirate. Then he said abruptly:

"Touch your lamp against one of them!"

"Not on your life!" cried the tenderfoot, backing off.

"If you don't, I'll—I'll lose you!"

The threat was effective. The sufferer approached his doom with the same confidence that a woman picks up a garter snake. There was a fizz of tiny stars that follow the ignition of a skyrocket. The tenderfoot made a wild break for liberty and got wedged in between the coal car and the room neck. A free panorama of all the wicked things he'd ever done swept along the black avenue.

"Well, why don't you go through?"

It was Jack sauntering leisurely along behind, careless of the two sputtering fuses in the room. He extricated his companion, who indignantly complained:

"That's the way with you fellows; you stand in front of a cannon till it blows your head off and then you lay it on the company!"

Soon all the shots were fired, and the squad sat down on some timbers to rest until the men who had been on a similar mission to the west joined them. And while waiting they told how Tom Francis, a Welshman, superintendent of the Loomis mine, had stood all night down in the mine with water up to his neck, laying brick across a cave-in, so as to stop an inundation from destroying the mine, and had been given a gold watch and the thanks of the company; how Dave Williams, day engineer, had stayed by his machine with the room burning above and below until every man had been hoisted from the mine; and how in the days of the big strike young Dannie Hughes, night operator, had fingered his instrument and aided the movement of trains all night long despite the crash of glass from rifle balls and the singing of deadly missiles overhead. It was a wonderful story, the story of the mine, as full of courage and of sacrifice as anything that comes from the battle-field.

At last two flickering lights were seen down the dark entry and the shotfirers of the west section came up like shadows and the group meandered to the "bottom," where the cage waited. Jack pulled a cord to one side of the shaft, and presently from somewhere above came two cheery blasts from the whistle and the cage glided upward.

Night had come on and the stars were shining. The layman looked at the dome above with a feeling of relief. Jack waved his hand upward and chuckled:

"No danger of that roof falling."

THE LABOR SITUATION

General Labor Review

The big meeting of mine workers is ended. Its big job was to ratify the Washington agreement, which it did most satisfactorily. There should now be peace in labor circles till after the war, or till 1920, whichever comes first. The opportunity to develop patriotism and exhibit it was, however, the most evident element in the meeting. Perhaps the spirit of nationalism and sacrifice will endure long in the minds and hearts of the participants after the questions regarding the Washington agreement are forgotten. We pass over Howat; surely no one can forget him too soon. He does not in any way represent unionism.

The decision about the Central Competitive Region, apparently reached when the leaders were napping, may be quite important. The mine workers are divided in their opinion about it. That is evident, or they would not have reversed themselves as they did. Perhaps the operators, outside the anthracite region, will be found almost equally divided. The matter does not seem one for bitterness. Only regions with low wage scales, which does not necessarily mean with low wages, need to fear the new arrangement. Really we do not anticipate that in any sections of the country, the operators or the mine workers will try to work an injustice on the operators or the mine workers of any other section. Still every section knows or thinks it knows its own needs and its own woes best. When a vote is cast for unification, the unificators as well as those who are urged into union are apt to suffer from the change.

Labor Hyphenates of Laflin Make Trouble

Strange to say, there has been a strike in the anthracite region at the Keystone colliery of the Traders Coal Co., near Laflin, Luzerne County. Yet it is not so very strange after all. Laflin has been a center of the dual membership, so severely scored at the International meeting. Many men belong not only to the United Mine Workers but also to the International Workers of the World. They are a bad brand of hyphenates.

The trouble started on Jan. 21, and 350 men have been idle for a week. One day an engineer reported late for work, so the men could not be lowered into the mine in the cage in time to start work. The superintendent told the men to go down by the slope. One man is alleged to have become abusive, and he was discharged by the superintendent.

This enraged the employees, who are mostly Italians, and placards were placed at various places by the men, declaring a strike. A grievance committee was sent to the company's office, but the company refused to heed the request for the superintendent's dismissal.

A Talk With the Boss and the Strike Ends

At the Bellevue mine of the Delaware, Lackawanna & Western R.R., coal department, the miners went on strike because they were not paid at the time desired and expected. A vote to return to work was taken at a meeting attended by an official of the company, who made it plain that the employees would be paid in a satisfactory manner. The practice of meeting the men face to face in conclave is a good one and to be commended. When there is as little to complain of, as in this case, it will always cure the difficulty.

The miners in many parts of the country are being induced by the National Railroad Administration to clear the railroad tracks. Just as the miners helped valiantly in the rebuilding of the tracks up Cabin Creek in West Virginia after the great flood so now in the West Virginia coal fields hundreds of miners are helping to remove the snow fall which prevents them from doing their work. They may be asked to do more than this, for there have been washouts along the main line of the Norfolk & Western Ry. and at several other points.

With Howat's promise of a strike, to include many of the mines in the Southwest, troubling us, it is pleasant to turn to the fact that just now almost the only trouble in that region is at the Smith, Scott & White strip-pits, near Cambria, Kan., where the workmen quit on Dec. 29 because of a controversy over the assigning of derrick men to other work because they were regarded as incompetent to fill their jobs.

As usual, Alex Howat says the men are not striking and the matter cannot therefore be settled. There is, from his point of view, nothing to settle. The local union, however, seems to scent that there really is a strike, for it has passed an order that any man who takes the place of the derrick workers pending an adjustment will be fined $35. In all, there are 105 men in the three strip mines, and the production exceeds 900 tons a day when the pits are working.

Kansas is now in the midst of a controversy over the examination and licensing of night firemen, who in practice and under the agreement signed a few months ago may operate the engines at night, and may hoist and lower shotfirers and other workmen when called upon to do so. One of the state inspectors is said to be insisting that these men shall be engineers, though the custom here as elsewhere is to put firemen on the night shift and later advance them to engineers when they receive a license. It is not thought necessary that they shall receive a license for the night turn where the work is not hurried and difficulties are not likely to occur.

The Convention at Indianapolis

The attitude of the mine workers at the Indianapolis Convention is well illustrated by a resolution from Klein, Mont., urging that 25c. a month be collected from the membership in aid of the Red Cross. The resolution did not carry, it is true. The United Mine Workers of America feel that the obligation on them is one which comes to them rather as citizens than as a union, but none the less the 25c. a month, and more than 25c., will doubtless be forthcoming.

Let us not forget to say that though the miners are defending themselves fiercely against being called slackers, they are publishing in their "Daily Convention Reporter" the long list of strikes in Kansas, which show a slack and disloyal spirit. When an organization like the Mine Workers confesses the sins of certain of its members, though few in numbers, it goes a long way toward shriving itself of what sins have been committed. It is a mark of patriotism that it is so ready to point out and make public the errors that are being, and have been, committed by a little band of willful men who are not worthy of membership in this union of patriotic and devoted citizens.

A terrible indictment against Alex. Howat is this long list of strikes permitted during a national crisis. It hardly seems possible, however, that the penalty clause will wipe them out in the future. Patriotic propaganda and patient work on the part of union men is the only thing that will end the disgraceful insurgency of the Southwestern States.

Another answer to those who would say that the union as a whole is unpatriotic was furnished by the vote to pay John P. White his salary of $5000 a year as adviser to Dr. Garfield in the Fuel Administration. It was a clear indorsement of his patriotic support of a policy of conciliation and coal production.

The mine workers voted to condemn House Bill 195, now in Congress, which grants a preferential right to the State of Oklahoma to purchase a coal acreage underlaid with 3,000,000 tons of coal. The mine workers do not object to state ownership, but to the prospect, or rather certainty, that the coal will be mined by convict labor.

On Jan. 21 the most important decision of the convention was made by the assembled delegates. They approved the Washington agreement and so adopted all the wage scales, district and subdistrict, for the period of the war, provided it does not last beyond Apr. 1, 1920. The vote was overwhelming. There never was any real opposition to the Washington agreement, though Howat and a few of his political aides by their activity gave the impression that there was.

Howat's Policies Meet With Disapprobation

During the few weeks preceding the convention Howat wrote acquaintances in various states and told them that his delegation was lined up solidly in opposition to ratification. He guaranteed that he had mustered strength enough to prevent the convention from registering its approval. He held out hopes of benefits to those who would line up with him. He forecasted that by reason of his leadership in defeating the penalty provision he would be able to name the presidential candidate.

But it was not to be. Howat is a broken man. The United Mine Workers are citizens of the United States. Some day Howat will learn that fact. At present he thinks they do not realize there is a war and do not know that they have a duty to perform.

So, from now on, the mine workers and the operators can devote themselves steadily to the mining of coal and not waste time over organization and discussion like a lot of Bolsheviki. Unfortunately the country is so short of locomotives and cars, especially the former, that the mine workers and operators have too many idle days.

Who Shall Make Central Competitive Contracts?

Jan. 22 appeared only less important than the day preceding. However, appearances were deceiving, for by a later vote, on Jan. 26, the work of the day was finally made of no effect. By a vote of 654 in favor and 605 against, the older and cooler heads of the United Mine Workers failed to recommit to a special committee a resolution granting outlying districts representation in the wage conferences of the Central Field. The vote came after two days of debate. The International officials and older heads in the union contended that the amendment was impracticable, for the operators would never consent to meet the men from other districts and have Kansas, for instance, help to decide what Ohio should pay its men.

The resolution was capable of many diverse constructions, but it plainly stated that in no case could the International officials call a wage conference or negotiate a wage scale without having first called into conference the officials of all outlying districts, including the anthracite region. Moreover, provision was made to give the representatives of all the districts voice and vote in the formulation of a policy and in the writing of the wage demands presented to the operators. These representatives would also have a right to a voice and a vote in the conference negotiations, even though the conference would only deal with wage questions directly affecting the Central Competitive Field.

Hayes, Savage and Kennedy Oppose Resolution

President Hayes contended that the present "policy committee" (composed of the district presidents of all the districts), which is called together immediately after a scale is drafted to consider that scale, is sufficient protection for the interests of the outlying districts. Secretary Savage, of the Ohio district of the United Mine Workers, declared that the resolution was dangerous, as the mine operators of Ohio and western Pennsylvania are even now considering a withdrawal from the Central Competitive District. Any attempt to ring in or consult operators or mine workers from other districts, in short in a degree to enlarge the Central Competitive District, would fail in the judgment of Secretary Savage.

All the anti-administrationists—the outs—were lined up solidly behind the measure which was introduced jointly by 14 local unions located in Missouri, Kansas and Illinois. Thomas Kennedy, President of No. 7, a district centering around Hazelton, also protested against the resolution. The anthracite district leaders, as was said last week, are not at all disposed to try to control, or even take a part in controlling, the bituminous wage contracts. They desire to go along in their own way. Tom Kennedy said that if the arrangement suggested was made it would do the union much harm in the anthracite region. The anthracite operators, he believed, would have granted the mine workers complete recognition had the union consisted solely of the mine workers of the hard-coal region. The anthracite operators do not care to meet a general conference of all the mining interests because they realize that the anthracite men would be outvoted. They have always refused to meet with the bituminous mine workers.

The debate was bitter, and the delegates indulged in personalities, charges and countercharges. Half the afternoon session was devoted to maintaining order. The problem is a difficult one. The representatives of the mine workers and the operators of the Central Competitive District meet with the International officials, and a contract is written which the officials of the district and the International officials assent to, subject to the will of the union.

To Date Outliers Have Only Ratified Contract

The policy committee of the whole union considers whether the contract is satisfactory enough for submission to a referendum. Then if it is, the referendum follows and everybody votes whether in the Central Competitive District or not. It is clear that the Central Competitive District has a great deal of power. It virtually determines the scale for the other districts, for they ultimately line up with the scale accepted in the district first signing, not only because it signs first, but because its size gives it predominance. However, while in a way it controls the settlement, in another way it is itself controlled. Ohio might complain that Washington votes on the Ohio scale, and Washington can retort that Ohio writes a scale which Washington is more or less compelled to follow.

On Jan. 23, Samuel Gompers, president of the Federation of Labor, made a speech in which he said that organized labor must uphold the hands of the Government, even though labor might be called upon to make some sacrifices. He said that these sacrifices were imposed on mankind by the progress of evolution. They are but the penalties which democracy must pay if it would enjoy freedom and justice. Mr. Gompers then declared that no one who had been suggested to conduct the war affairs of the Nation in place of the civilians who were now charged with that responsibility had ever performed a public service. He urged the retention of the present government and civilian heads as executives and advisers in the prosecution of the war.

More Money To Be Spent for Tom Mooney's Defense

The convention voted unanimously to aid Thomas Mooney, Rena Mooney and Edward Nolan, charged with being plotters of the San Francisco bomb explosion, which took place during a preparedness parade. Direct appeal will be made to President Wilson, asking him to prevent the execution of Mooney. A special committee will determine how much money shall be expended in the defense. Several thousand dollars have already been contributed by the International Executive Board and other thousands by local and district organizations.

John P. White, on Thursday, Jan. 24, made a ringing speech, and as a result the convention overwhelmingly defeated a resolution to take the power of appointing organizers out of the hands of the International President. The proposal to do this was championed by John Lawson, of Colorado, the rules of order being suspended in order to permit him to speak.

James Moran, acting president of the Colorado district, charged that Lawson was employed by the Victor-American Fuel Co., of Colorado, as a labor agent, and by every

reason of right should be ousted from membership; and Lawson did not deny the charge. The whole morning session was unruly. The conservative delegates finally forced consideration of a motion to close debate. The chair endeavored to forestall this action so that International President Hayes might be heard, but the chair could not succeed in getting its will accomplished. Mr. Hayes' speech was not needed, as the majority was already with him.

On Jan. 26 Alex. Howat, the irrepressible Kansas President, threatened to call a strike in Kansas at all the mines where fines had been collected under the Washington agreement. He declared he would "pull" the miners out as soon as he got back to Kansas. He managed to get his speech before the delegates in a plea of personal privilege. He declared that he was injured by ex-president White's reference to him as a demagogue. Howat received little applause from the convention, and by a chorus of slurring remarks the convention evidenced its disapproval of the threatened action.

Mother Jones, who has always during her 83 years denounced courts, introduced a resolution commending the Supreme Court of Arizona for deciding the election contest in favor of Governor Hunt and against his rival acting-Governor Campbell. She had, however, to return to form by bitterly denouncing the Supreme Court of the United States and all other state supreme courts which had rendered decisions affecting the mine workers' organizations.

Undoes All the Work of Two Preceding Days

On Jan. 26 J. C. Lewis, of Iowa, managed to secure the passage of the following resolution nullifying the victory of the Friday proceeding. The resolution is reprinted in full, for it is likely to be a matter of some debate later.

Whereas, We believe that the operators and miners of the outlying districts where bituminous coal is mined should be represented in joint conferences when basic wage agreements are being made, so that the representatives of each district may have a voice and vote in determining what wages and conditions shall be agreed upon for their respective districts; therefore be it

Resolved, That the International Executive Board and the representatives of the four states known as the Interstate Movement—namely, Illinois, Indiana, Ohio and western Pennsylvania—be instructed by this convention to take steps and make further and greater effort to enlarge the Interstate Joint Conference by the admittance of such as they are able to agree upon; and be it further resolved that when the Interstate Conferences are to be held it shall be the duty of the international secretary-treasurer to notify the resident officers of each district when and where the conference is to be held so that they may so journey to the city where said conference is being held, if they wish to do so, and the representatives of the outlying districts shall be permitted to sit in conference with the representatives of the miners of the Interstate Conference when they are meeting for the purpose of negotiating wage scales and have a right to voice their sentiments on questions that may affect their districts, and be it further

Resolved, That no agreement be made governing the outlying districts unless the representatives of said districts are given a voice and vote on the same.

Will the Operators Consent To Negotiate?

It now remains to be seen how the operators will view the proposition. The distant date, 1920, makes it less important a consideration that it would otherwise be.

The pension system proposed by the old-age committee, whereby each miner over the age of 60 years would secure a pension of $20 per month, was referred to the rank and file for consideration with a continuation of the committee to bring before the next international convention a report embodying the wishes of the membership.

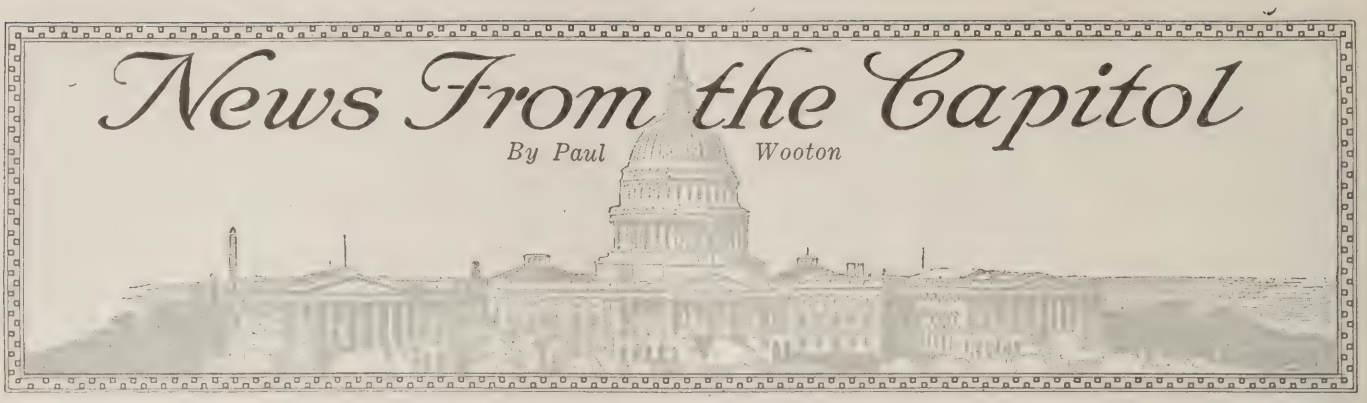
The meeting came to a close Jan. 26, after making provision to file the $800,000 bond necessary to appeal the judgment of the Coronado Coal Co. against the union. The Pennsylvania Mining Co. with mines in Arkansas and headquarters in Scranton, Penn., is preparing to bring suit against the union for $500,000 before the Federal Court

Union Membership Has Increased Greatly

The membership of the United Mine Workers of America has steadily grown since October, 1910. In October, 1917, the membership had increased 75.93 per cent.

It will be noticed that in the earlier year Districts Nos. 1, 5 and 7 in the anthracite region were quite sparsely organized. This, with their more complete organization at present, accounts for the great growth in membership. However, when we add the membership in the three districts together we find that there are 65,441 union men. In 1916 there were 159,169 men engaged in anthracite region, so it is clear that there are still a few men who have not joined the union. In fact, union strength is roughly only 41 per cent. of the possible figure.

MEMBERSHIP OF UNITED MINE WORKS OF AMERICA



Districts Number	Location	October, 1910	October, 1917	Numerical Increase	Per Cent. Increase
1	Scranton district, Pennsylvania	4,930	27,550	22,620	408.82

Totals		236,059	415,305	179,246	75.93

Western Pennsylvania, early unionized, shows almost no growth since 1910, despite all the efforts made and the undoubted progress in 1917 along the Allegheny River and its tributaries. The decrease is larger in central Pennsylvania, which was quite generously unionized in 1910; but the membership is still far from 100 per cent.

Kansas, Colorado, eastern Kentucky, Tennessee, Alabama, Arkansas, Oklahoma, Texas and Missouri have all increased their union members immensely. Maryland and West Virginia and District 28 in Canada have come into being, the latter, however, being extremely weak. District 26, also in Canada, has lost all its membership. Iowa, Indiana, western Kentucky and Michigan have lost membership in large measure.

As there were 720,971 men employed in the coal industry of the United States during the fiscal year ending June 30, 1917, according to the United States Geological Survey, the proportion of union men is 57.60 per cent. of that possible.

The extent to which unrest is fomented by pro-German influences is indicated by the fact that more than 150 Illinois miners have been arrested on charges of disloyalty to the United States, according to information given out at Springfield, Ill. Most of them are held on charges of attempting to cripple war industries by checking coal production. A large number of secret service agents have been sent into the mining districts. President Frank Farrington says there has been a great deal of pro-German propaganda among the miners, 60 per cent. of whom are foreigners, representing 29 nationalities.

[*Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Metropolitan Bank Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 703, Metropolitan Bank Building, Washington, D. C., while at the capital.—Editor.*]

Garfield Announces His Coal Distribution Plan

Formal announcement of the long-expected distribution plan was made by the Fuel Administrator Jan. 25. Operation of the plan is expected to result in the consumer's receiving coal from the nearest point of production. It is expected to reduce cross-hauling to a minimum and to speed up deliveries of loaded cars and returns of empties. Each state will be allotted its quota, which will be supplied from certain designated producing districts. Great care was taken by Dr. Garfield and members of his staff in the compilation of a letter to state fuel administrators, which explains the working of the new system. That letter reads as follows:

As soon as district representatives are appointed, all state administrators who may call upon them will be notified. Individual shippers and mines within those districts for which district representatives have been appointed will be notified to refer any orders or requests for shipment of coal made upon them by any member of the United States Fuel Administration to the proper district representative. State administrators accordingly should direct all emergency requests for fuel to the district representative in charge of the particular coal field from which the relief is to be obtained, rather than to an individual operator within that district. This will prevent shippers from receiving conflicting orders from different members of the Fuel Administration, and will insure more prompt attention to such requests because of their being made in the field by a man thoroughly conversant with the local situation and the available supply. No emergency requests should be made directly to Washington by state administrators unless the proper district representative has been unable to supply the necessary coal.

In order that the bituminous coal supply of the country may be apportioned equitably among the different states, and among the various consumers in each state according to the relative importance of their needs, it is necessary that the work of the Fuel Administration in regard to the apportionment and distribution of bituminous coal be not limited to the relieving of emergency shortages. Accordingly, the available coal production of the country is to be apportioned among the various states, based upon previous consumption and the changes resulting from the entrance of the United States into the war. In order that cross-hauling may be reduced to a minimum and that each state may receive coals adopted to its needs, the particular fields from which each state shall draw its supply will be designated (byproduct and gas coal excepted). When this budget is complete, the consumers of each state will be notified through the press that their coal must be obtained from certain specified fields. Producers will then be allowed to ship only to consumers in the states designated, and jobbers will be required to observe the same rules. In other respects the normal distribution of coal will go on without interference.

State administrators, as soon as the tentative apportionment is complete, will be informed as to the particular fields upon which they may call for coal, and the quantities they may secure from each. When a state is currently receiving its full allotment of coal, all further needs must be met by reducing the quantity supplied to other consumers in that state. District representatives will be instructed to comply with any requests for coal made by designated state administrators up to the amount allotted to their respective states. Should any state have a demand for coal in excess of its allotment, this excess will have to be taken care of by a curtailment of consumption, unless a temporary or permanent readjustment of the allotment be made by Washington.

The foregoing is a part of the new plan, details of which are being worked out as rapidly as possible and will be announced to you as soon as they can be perfected. It should be clearly understood that it is not intended that the rights and duties of the state fuel administrators shall be lessened in any respect. On the contrary, the state administrators will retain all of their present responsibilities. The purpose of the plan is to facilitate the handling of emergencies and to define the limitation of supply. The only changes are in the creation of a new office in the field which will aid state administrators in promptly relieving emergency shortages, in reducing the number of such cases which must be referred to Washington, and in making provision for insuring that each state will receive its proper proportion of the available coal supply. In all other respects, state administrators will continue to keep in touch with Washington as heretofore.

Free Time for Detention of Coal Reduced from Ten Days to Six

Reductions in free time for the detention of carload shipments of coal at New York harbor, Wilmington, Philadelphia and Baltimore tidewater terminals, have been allowed by the Interstate Commerce Commission. Free time under the straight demurrage plan is reduced from ten days to six and, under the average agreement plan, from five to three days.

Various of the coal-mining companies, associations and dealers protested against this change. The opinion

was written by Commissioners McChord, Meyer and Aitchison. An extract from the opinion is as follows:

While in many instances the present allowances of free time have been materially exceeded, it appears that the general average detention on all of respondents' lines during the year 1916, under disadvantageous conditions, was less than the free time under the proposed schedules for the straight demurrage plan, and the figures submitted for the first part of the year 1917 indicate that the abnormal conditions have been to some extent relieved and the average detention correspondingly decreased; furthermore, that a number of shippers, under varying circumstances, have been able to conduct their tidewater business within the average free time proposed, even under the abnormal conditions which have existed. While the protestants have shown that considerable demurrage has accrued on cars and on boats from irregularity in the periods of time cars were en route over the lines of certain carriers, it also appears that the irregularity of movement has been caused to a large extent by the congestion of traffic at the ports. In other words, the record does not demonstrate that either condition is the cause or the effect, and the fair conclusion is that each in turn has contributed to the other. While, therefore, the reasonableness of any period of free time for this traffic may well depend in large measure upon a fair and efficient coöperation on respondents' part, the carriers' equipment should not be detained for storage purposes beyond any period reasonably necessary to effect its release, and, subject to such modifications as future practical results may require, our conclusion is that the periods proposed should suffice.

No Coal To Be Diverted Without Consent of Fuel Administration

Confusion caused by the diversion of coal by state fuel administrators and by chairmen of local committees made it necessary for the Fuel Administration last week to issue a number of orders limiting the authority of these officials. The coal consigned to tidewater is not to be diverted without permission from Washington. Coal consigned to byproduct coke ovens is not to be diverted except in emergency to relieve human suffering. Any coal for a destination outside of the state is not to be diverted without permission from Washington. Local committee chairmen are allowed to divert only such coal as is consigned to their community. Among the other orders issued was one making the official ordering the diversion responsible for the payment for the coal.

Weekly Production Statistics

Weather conditions during the week ended Jan. 19 are held mainly responsible for a decided slump in coal production. During that week, 8,602,000 tons was produced. This is an average of 1,434,000 tons per working day, which is among the lowest recorded during the past twelve months. Beehive coke to the amount of 527,000 tons was produced during the week ended Jan. 19. This is somewhat less than production during the week ended Jan. 12, when 562,000 tons of coke was made, but it is an improvement over the week ended Jan. 5, when 455,000 tons was made. Anthracite shipments also reflected weather conditions. Forwardings during the week ended Jan. 19 were 31,861 cars, as compared with 36,178 cars during the week preceding. These figures are compiled from the returns made to the United States Geological Survey.

Factors which limited production are not yet available for the week ended Jan. 19, but for the week ended Jan. 12, when conditions were not at the worst, they show that 25 per cent. of the full-time capacity of the mines was lost due to car shortage. Labor difficulties caused a loss of 2.9 per cent.; mine disability, 4.3 per cent., and all other causes, 2 per cent.

More District Representatives Appointed

E. R. Clayton, of Harlan, Ky., has been appointed district representative for the coal fields located in Georgia, Tennessee and in the Counties of Bell, Harlan, Knox, Whitely, McCreary and Laurel in Kentucky. There are to be 20 district representatives appointed, of which Mr. Clayton is the sixth to be made public.

The Hazard coal field, which is comprised of Perry, Breathitt and Lee Counties in Kentucky, is to be represented on the Fuel Administration staff by R. A. Hord, of Lexington, Kentucky.

The district representative of the Fuel Administration who will look after distribution in the Pennsylvania counties of Armstrong, Butler, Clarion, Mercer and portions of Lawrence and Indiana Counties, will be F. B. Reimann, of Butler, Pennsylvania.

R. W. Gardiner, of Pittsburgh, will be the district representative for the following counties of Pennsylvania: Allegheny, Green, Washington, Westmoreland (west of the Youghiogheny River) and Fayette (in part).

J. B. Zerbe, of Cleveland, has been appointed the representative of the Fuel Administration for the coal-mining district covering the counties of Belmont, Columbiana, Carroll, Coshocton, Guernsey, Harrison, Jefferson, Mahoning, Noble, Portage, Stark, Tuscawaras and Wayne, in Ohio, and the counties of Brooke, Hancock, Marshall and Ohio, in West Virginia.

Brief Washington Notes

A revision downward has been made by the Fuel Administration in prices in the Deerfield, Massillon and Jackson fields in Ohio. The prices fixed are as follows: Run-of-mine, $3.25; prepared sizes, $3.50; screenings $3. Prices prevailing before the order were: Run-of-mine, $3.75; prepared sizes, $4; screenings, $3. Such operators as have complied with the terms of the Washington wage agreement may add 45c. to the prices specified.

Contracts for coal dated before Aug. 21, 1917, which contain no provision for changes in the wage scale, are not now susceptible to the addition of the 45c. increase allowed by the President. The Fuel Administrator issued a statement to that effect when he learned that some consumers had been notified that their contract price would be increased to cover the advance in the wage scale.

In order to make plain how the United States Fuel Administrator approves prices fixed by local officials, instructions with regard to retail prices and margins, which were sent to the local committees, have been made public. In the same order the right of appeal to the United States Fuel Administrator on the part of any individual is granted.

EDITORIALS

Providing a Remedy

IN CASE of sickness, it is always necessary to diagnose the case and determine the nature of the ailment before a remedy can be provided. Only a few weeks ago railroad officials were disclaiming responsibility for a shortage of fuel. The Garfield closing-down order has emphasized more than anything else that the real trouble is a lack of locomotives. It is therefore gratifying to know that Director McAdoo recognizes the situation. He has commandeered all the locomotives that will be built in the United States during January, February and March of this year. As fast as these locomotives (approximately 700 in number) are completed, they will be turned over to Mr. Smith, Director McAdoo's chief assistant, and will be assigned to those eastern roads that are most in need of motive power.

Although it is too late to correct the present trouble, it is good to know that we are at last on the right track, and that before long there will be sufficient engines and enough ships to carry all the products that the essential industries of America can produce when working at full speed. It is better late than not at all, and before we get through with our present job we will strike our real pace and quickly finish the thing we have started to do.

The War Sets Astir a New Spirit

IN THE distribution of credit for helping to win the war, we must not overlook the mine workers' union. Before the war started the union workmen in the anthracite region held that to load four cars a day was a proper stint for the working force of a single breast—namely, one miner and a laborer.

A miner who dared mine more than the customary four carloads would be regarded with disfavor by his fellows, to say the least. Even if he could load the four cars in five hours it made no difference. The men competed to see who could do the daily stint and arrive at the garden gate first. The drivers also held back on the ambitious and so kept the tonnage down to what they considered a proper figure.

But the war and the want have changed all that. The union has put all such considerations behind it. Now the men who do more a day are praised and admired. At some mines the double shift has become quite common. At other mines, like those of the Pennsylvania Coal Co., the men have till lately been working nine hours. So despite a 20 per cent. shortage of labor there is a 10 per cent. increase in production.

The nine-hour day may eventually be a solution of the needs of the hour. The subject has been taken up by the Conciliation Board, the operator members favoring it. The miners and other mine workers are still a little doubtful. Some men have questioned if more hours would mean more coal, but we are sure that when the railroads get their proper stride the mine workers will decide that the longer hours will be justified. No one wants the mine worker to work overtime with frequency if concurrently with that overtime goes several days of idleness.

But better than the prospect of a nine-hour day has been the spirit of patriotism and sacrifice that has made that nine-hour day a possibility. As a result of the new spirit some miners and their laborers are mining eight car loads a day instead of four. The race for the garden gate is ended, and the sense of duty done is bringing to the heart of the mine worker—always a big-hearted fellow—all the joy that goes with performing a big service in a large way.

The average earnings of energetic miners in the anthracite region are now about $200 a month. Many of them are making $10 a day, or $300 a month. The laborers earn about $125 a month. A good day's work is worth good pay, and there is no reason why the mine worker should not get it.

Nova Scotia Gets Unfortunate Publicity

NOVA SCOTIA has some of the best mines on the American continent. We wish that the public knew no more about Nova Scotia than that fact. Unfortunately two bad explosions have recently made the province appear in the public prints. One occurred in the No. 12 colliery of the Dominion Coal Co., near Waterford, July 26 of last year, and the other is so recent, Jan. 23, that the casualty list is probably not yet completely determined.

The latter accident occurred at the Allan shaft, Stellarton in Pictou County, a long way from last year's disaster. There has been a fire in the workings and perhaps it was from this that the accident occurred. Strange to say the explosions, for there were two, were not severe. The first was but slightly felt at the surface. The second, which occurred ten minutes later, was more forcible but it did little damage to the shaft. A few minutes later the engineman was signaled to lower the cage to the 500-ft. landing. Some eight men waiting there entered the cage and came to the surface. These men had not felt the jar but they did notice the smoke, and this manifestation alarmed them and caused them to seek safety. Three or four men working in that same seam apparently did not try to escape and were lost.

The cage was not able to reach the 1200-ft. landing owing to obstructions 20 ft. above the bottom. Not until men with oxygen helmets descended were they able to begin the rescue work. Probably 85 men were lost in this explosion.

There is no intention to single out Nova Scotia for blame. Our record here, in the United States, is this year no cause for congratulation. It does seem that the reasonable and fair price for coal which we promised would reduce accidents has failed to do so. It has

merely made our coal production more feverish and less disciplined. We need to take seriously to heart the unsolved problems of mine management and to adopt with a feverishness equal to that expended in production all the advances in safety which the industry has evolved.

No nation has been more painstaking in its analysis of mine and other accidents than Great Britain. In that noble work her colonies have for many years emulated her. Let us trust that from the investigation of the accident of the Acadia Coal Co.'s mine at Stellarton some message may come that will enable the mines of the United States and Canada to be run more safely than in the past. The mines will certainly have to submit to more stringent regulation, for no one will be satisfied until the present death rate is reduced.

West Virginia Coal Production

EARL A. HENRY, chief of the Department of Mines of West Virginia, has called our attention to several discrepancies in the statistics contained in the Jan. 19 issue. On page 101 of that issue, under "West Virginia," it will be noticed that Mr. Henry gave the production for his state for the year ended June 30, 1917, as 79,806,652 gross tons, which was an increase of 194,354 gross tons over the production last year. On page 117, in the table showing coal production in the United States in 1917, the output of West Virginia is given as 79,806,652 net tons. The correct figures for West Virginia production for the period ended June 30, 1917, reduced to net tons, should be 89,383,450.

It will be obvious to the readers of *Coal Age* that when proper credit is given to West Virginia she will still retain her position of second place in the coal-producing states, as Illinois, to which we allotted that position, produced only 85,700,000 net tons, estimated, while the West Virginia figures are based on actual production. Instead of a decrease, therefore, West Virginia shows an increase of 217,676 net tons.

This is only another instance of the desirability of having all reports of production expressed in net (short) tons, and *Coal Age* again wishes to emphasize that fact. The inspectors of the different coal-mining states should exert their endeavors to bring about such a standardization.

A Proposed Advisory Coal Committee

REPRESENTATIVES of wholesale coal trade associations have presented recommendations to the United States Fuel Administrator, suggesting that he avail himself of the experience and advice of practical coal men at the present time of national stress. The movement is widely indorsed, especially by the trade end of the industry.

The plan as outlined calls for a committee of fifteen members, of which committee five members will be coal operators, five will be coal jobbers, two will be railroad men, two will represent labor, and one member will represent the United States Government. The plan further states that the five coal operators and the five coal jobbers shall each have sub-advisory committees from their respective districts, with a view to keeping them advised of the changing conditions in the various localities.

There is not the least doubt that there is a serious lack of experienced coal men on the staff of the Fuel Administrator. This has been the chief point of attack of those who have criticised Dr. Garfield. However, it is not plain just how such an advisory committee could work in harmony with the present organization of the Fuel Administration. The hand of the Government was shown clearly when it took away the authority of the Peabody committee, which had in its personnel some of the ablest coal-mining men in America. There appears to be a certain Federal distrust of the Nation's most successful business men. At any rate, the general policy has been to give authority for regulating an industry to men not at all versed in the technical or business details of that particular industry. There seems to be a fear that the men who know most about coal mining and railroading would not be able to overcome their personal prejudices and administer in an impartial manner.

Any move that will result in causing Dr. Garfield to call more of our experienced coal men into his service is indeed welcome. We do not anticipate that the present plan for an advisory committee of fifteen will meet with success. However, it is a proposal that aims to correct in some measure the great weakness of the Fuel Administrator's organization, and as such it is not without merit.

Miners' Convention Worth the Cost

THE mine workers' convention at Indianapolis cost the union men a pretty penny. There were 1752 delegates, and the transportation costs will be $40,596.70, about a dime per member. Of course, these costs only represent a small part of what the international organization and 1772 locals will have to pay.

It is sometimes questionable whether these large conventions are profitable. But they certainly are necessary for the education of those attending them. Education is the very keystone of our civilization. Nothing better serves capital than education. The countries where workingmen are intelligent and informed are those in which capital makes the largest ultimate returns. No large and successful industry can ever be built on the work of ignorant employees.

The meetings of the mine workers undoubtedly liberalize their minds. The narrow bitterness of men who never travel is broadened by meeting men of larger viewpoint. They learn the size, the scope, the marvel of the great country in which they live. They learn about other people's difficulties, and they are broadened. The mine work thus gets its proper perspective. The men return prouder and yet at the same time more tolerant.

The education of the masses has too long been feared. Some of the masses today are beginning to denounce education because the men who have it lose their narrowness and see that even if the workman ruled the world he would find himself ruled in turn by economic laws and in harder straits than under the capitalistic *régime*. Why, therefore, should any one fear education? Its ultimate result is to teach the whole truth, and the world will always be best ruled when whole truths and not miserable half truths and prejudices form the basis of its laws.

Conductor Wilson—"Say! You three guys, give the lady your seat. Who let you on here anyway? You fellows belong in the gob."

Slate Must Not Ride on a Coal Ticket

A ton of coal is soon mined, but it is a long time getting to market. It doesn't take as much work to mine a ton of coal as it does to haul it to market and deliver it and stoke it and carry out the ashes.

The Miner Only STARTS *the Coal on its Way*

If he starts some rock, clay, slate or bone with it, that rubbish travels just as far, gives just as much work, but provides no heat. One hundred tons of slate takes just as many railroad cars and just as many locomotives to haul it as 100 tons of coal. It takes the same work to move it and to unload it and to get it into the bunkers, and just as much work or a little more to stoke it; and far more work to load it out as ashes which, in turn, may have to be carted several miles.

With such a shortage of locomotives and railroad cars as we now have, it is everybody's duty to keep slate from riding on a coal ticket. We cannot afford to have it taking up car space, bunker space and grate space.

Don't Load Out Dirt:
Uncle Sam Pays For and Wants Clean Coal

LEGAL DEPARTMENT

INJURY IN HANDLING CARS IN MINES—In affirming judgment in favor of a miner who was injured while temporarily assigned to the work of repairing a track in a mine, work in which he was somewhat experienced, the accident being caused by a collision of cars backed into a derailed car near which he was working, it is held that the operator is liable on the ground of negligence of the employee's foreman in assigning him to the work without placing signals to protect him, or without warning the employees who were operating the cars of the danger of injuring him. Under the circumstances, the injured man cannot be deemed to have assumed the risk of the accident. (Virginia Supreme Court of Appeals, Clinchfield Coal Corporation vs. Ray, 93 Southeastern Reporter, 601.)

PROXIMATE CAUSE OF MINER'S DEATH—Where a coal miner was severely burned by an explosion of mine gas, for which his employer was responsible, the fact that the miner contracted hypostatic pneumonia, resulting in death and caused by the burns and the position in which he was compelled to lie, cannot be said to be so remote from the accident as to exonerate the employer from liability for damages for the death. Where two concurring causes produce an injury, which would not have resulted in the absence of either, a person producing either cause is liable for the consequent injury. (Arkansas Supreme Court, Sterling Anthracite Coal Co. vs. Strope, 197 Southwestern Reporter, 858.)

WHO MAY NOT SUE AS FOR TRESPASS IN REMOVING COAL IN PLACE?—Plaintiff was not entitled to maintain an action for damages for removal of coal from land of which he had neither actual nor constructive possession, the surface being in the possession of third parties who claimed title and under whose lease defendant removed the underlying coal. (Pennsylvania Supreme Court, Griffin vs. Delaware & Hudson Co., 101 Atlantic Reporter, 750.)

WHAT CONSTITUTES "MACHINERY AND APPARATUS" ON COAL DOCK?—RIGHTS TO INTEREST ON CLAIM—A railroad company leased to a coal company a coal dock at Superior, Wis., under agreement that on expiration of the lease the railroad company would buy at a fair valuation all the "machinery and apparatus" installed on the dock and used by the coal company with the lessor's consent. Held that the provision extended to all appliances which the lessee with the consent of the lessor placed on the dock, including trestles and cable system, wooden understructure of the same, the tracks and understructure of hoists, anthracite coal pockets, and other permanent structures. Under the general rule that interest is not recoverable on a litigated claim until the amount of the claim has become ascertained by judgment, the lessee was not entitled to interest on the value of the property left on the dock between the termination of the lease and an adjudication in court as to the amount of such value, the parties having failed to agree on the amount. (United States Circuit Court of Appeals, Eighth Circuit; Great Northern Railway Co. vs. Philadelphia & Reading Coal and Iron Co.; 242 Federal Reporter, 799.)

VIRGINIA MINING ACT APPLIED—The Virginia Mining Act contains the provision: "On all haulways where hauling is done by machinery of any kind, the mine foreman shall provide a proper system of signals and for the carrying of a conspicuous light on the front, and a light or flag on the rear, of every trip or train of cars when in motion, provided that this shall not apply to trips being hauled by gathering motors or mule teams when operating on other than main headings, and when hoisting or lowering men occurs before daylight in the morning or at evenings after darkness." In affirming judgment in favor of a miner who was killed in defendant's coal mine, the United States Circuit Court of Appeals, Fourth Circuit, holds that this statute applies where loaded cars are being pushed by a motor to the foot of an incline to be there connected with a hoist chain for movement to the tipple. (Johnson vs. Pocahontas Consolidated Collieries Co., 244 Federal Reporter, 368.) It is further decided that a mine inspector's erroneous interpretation of the statute as not requiring a light on moving cars at a particular point in a mine where the accident occurred, even though communicated to the operator, cannot relieve the latter from liability for actual damages sustained on account of the accident. It was also held that the jury was warranted in finding that the accident in question was directly due to failure to have a light displayed on the front of the cars which struck decedent while he was waiting on the track for other cars to pass on an adjoining track; and that decedent's act in going into the drift mouth of the mine to a point where it intersected, near the tipple, the entrance from the tipple, there to take a car to ride into the mine, did not constitute a traveling on foot to work on a motor road, in violation of the Virginia Mining Act. Another point held in the case is that decedent was not necessarily guilty of contributory negligence in standing on the track to let the cars on the other track pass, whereas he might have stood in a clear space of 5½ ft. between the tracks, because failure to have the cars which struck him lighted concealed their approach from him. Nor is recovery to be denied because decedent may have failed to listen for approaching cars, it appearing that the noise of the cars on the other track drowned the sound of those that struck him.

WHAT A MINER IMPLIEDLY REPRESENTS TO HIS EMPLOYER—When an adult man applies for employment in a mine, a mine operator is entitled to assume that he is reasonably well qualified by experience for the work he seeks, and, unless he discloses facts to the contrary, the employer is under no legal duty to instruct him against dangers commonly understood by miners engaged in the particular line of work. So where plaintiff had worked in mines for more than two years, observing and taking part in drilling and blasting with powder, the defendant in employing him was entitled to assume that he understood the necessity for careful examination of places where holes had been drilled and charged, before attempting to pick rock down after blasting, in order that any missed hole might be discovered. And since he did not apprise the defendant of any inexperience in such matters the company was not negligent in failing to provide a system of rules or instructions to safeguard him. (Utah Supreme Court, Olsen vs. Triangle Mining Co., 813.)

CARE OF ELECTRIC WIRES IN MINES—It is the duty of a mine operator to cause proper inspections of an electric feed wire strung along one side of an entry on the rib near the roof to be made with reasonable frequency to assure miners against the danger of coming in contact with the wire. Omission of an operator to use ordinary care to make a fallen wire reasonably safe, after it was known, or by the exercise of ordinary care might have been known, that the wire had fallen into a dangerous position, constituted actionable negligence, rendering the operator liable for fatal injuries sustained by a miner through coming in contact with the wire under circumstances which did not charge the man with contributory negligence. The burden to show contributory negligence rested upon the operator when sued, unless the plaintiff's evidence affirmatively established it. (Virginia Supreme Court of Appeals, Virginia Iron, Coal and Coke Co. vs. Prophet's Administrator, 93 Southeastern Reporter, 590.)

DISCUSSION BY READERS

Examination of a Mine

Letter No. 2—It appears from the reading of Letter No. 1, *Coal Age*, Dec. 22, p. 1069, that W. Dickinson claims the answer given by the editor to the question of a fireboss, regarding the manner in which he should examine a mine, is not complete. Mr. Dickinson then proceeds to explain his method of performing the duties of a fireboss in a West Virginia mine.

While I am not familiar with the requirements of the West Virginia mining law in this respect, I want to say that the answer given in *Coal Age* to this question explains exactly the procedure in Colorado when a fireboss is making his morning examination of a mine. Anything to the contrary would not be in compliance with the Colorado mining laws. I am inclined to believe, however, that the editor of *Coal Age* is fully familiar with the requirements in West Virginia and that these do not differ materially from those in Colorado.

Firebossing in Colorado Mines

When a fireboss makes an examination of a mine, in Colorado, his duties as a fireboss end when he has returned to the bottom of the shaft, entered his report in the book kept for that purpose, attached his signature, and reported to the mine foreman that the mine is safe for work, except for any dangers he may have noted in his report.

In doing this, the fireboss turns the mine over to the foreman who has full charge of the underground workings and the men employed therein. He then goes to his breakfast and, upon his return to the mine, seeks out the foreman and receives from him his instructions for the day.

How Practice Differs from That in Other States

Where practice in Colorado appears to differ from that in West Virginia, as explained by Mr. Dickinson, is in the work done by the fireboss when he returns to the mine after breakfast. Mr. Dickinson states that the fireboss then "makes a more careful examination of the air-courses and working places in his district, giving such instructions to the men as may be needed," which will complete his duties for the day.

In Colorado it is the duty of the fireboss, on returning from breakfast, to obey the instructions of the foreman and perform any work that the latter sees fit to give him. It may be the building of a concrete stopping, cleaning up roof falls or other similar work.

In the absence of any assistance, and the mine foreman being too busy to do the work himself, as required by Sec. 76 of the Colorado mining laws, he may order the fireboss to make a second examination of the mine, which must be done during working hours.

I recall an incident where a fireboss refused to perform certain work ordered by the mine foreman, claiming that he was not subject to the orders of the foreman. His refusal led to his prompt discharge from the company. In court the case was decided against the fireboss, and he has not been able to secure a similar position since.

It is not infrequent that firebosses consider their work in the examination of a mine continues for eight hours, and that they are independent of the mine foreman; but this is not the case in Colorado. During my spare hours, I have devoted much time to the study of the mining laws of this state, and I want to say that when an assistant foreman, fireboss, shotfirer or other employee disregards the orders of the mine foreman there is trouble ahead. Should anything go wrong the foreman alone is responsible.

Where the foreman has no particular work for the fireboss to do on his return to the mine, after breakfast, he can employ himself by extending brattices in the working places, not for the purpose of removing gas only, but to provide a better circulation of air and keep the temperature down, so that the men will not be as exhausted at the close of the shift as when they are required to work in hot and close places.

Let all firebosses remember that we are after the Grim Reaper, who so unmercifully takes away many of our good miners. Any suggestion that will sidetrack the Reaper and make his work less effective in the mine is gladly welcome. I believe in a thorough and rigid examination of the mine by a fireboss. He should see to it that all dangers are promptly removed and everything done to make the mine safer and healthier for work.

Where the working places are kept well ventilated, the miners can do more and better work. During working hours, the mine foreman is responsible for the production and output of coal, and it is a good plan to provide safety inspectors to inspect the mine daily.

Farr, Colo. ROBERT A. MARSHALL.

The Mine Gatehouse

Letter No. 2—The suggestion of a gatehouse at the mine entrance, made in the Foreword of Dec. 8, appeals to me chiefly as affording a means of checking the men passing in and out of the mine. Many of the coal-mining states, I believe, have a law requiring the use of a suitable checking system. In my opinion, where there are not too many openings that would afford opportunity for men to enter and leave the mine without it being known, the idea of a gatehouse seems wholly practicable.

It goes without saying that a mine of any size that has no system of checking the men that enter and leave the workings is a back number today. Where no other plan is feasible the mine regulations should insist on each man registering his number on a bulletin board when he enters the mine for work. This may require him to take a little longer route than he would otherwise, but the advantage gained justifies the extra effort.

Every operator should consider it his duty to assume a certain responsibility in regard to the number of

men at work in the mine at any time and be able to tell who they are when the information is desired. In order to do this, however, a perfect checking system must be arranged, and the gatehouse idea seems to offer the surest and most reliable method.

At mines where everyone is supposed to check himself in and out of the mine great uncertainty exists, as there are always those who forget to hang their checks on the board in the morning or take them off at night. This is true even where radical measures are adopted to cure men of their forgetfulness.

A thorough checking system that is reliable in every respect will go far toward driving the truth home to the heart of every mine worker that the country needs him at work in his place every day. The mine worker who lays off, except for sickness or other just cause, is as much a recreant to his patriotic obligations as the soldier who runs from the firing line or deserts the trenches. I believe that the gatehouse is an unfailing means of forcing this truth home. W. H. NOONE.

Thomas, W. Va.

Mutual Capitalizing

Letter No. 1—Allow me to commend the thought expressed in the Foreword entitled "Mutual Capitalizing," which appeared in *Coal Age*, Jan. 5, 1918. It is not without some experience in this particular field of endeavor that I am led to conclude you have struck the keynote to success in securing the highest efficiency in mine labor and a maximum production of coal, both of which are unquestionably supreme factors requisite to placing mining men, employers and employees in the first rank of loyal Americans, taking good care of the boys who must go "over the top."

It has been well said that the best kind of capitalizing, at the present time, is the mutual kind. And certainly one who has given the situation any consideration whatever will admit that profits and earnings are no longer the first in importance, but coal for the country's needs. Although hesitating to discuss this subject personally, the situation seems to demand that natural diffidence be cast aside and we all do our bit to assist the general understanding.

Success in Campaigning Among Miners

Mutual capitalization of coal-mining interests forms the corner stone to national prosperity—the strong shield of the nation's safety. To obtain this in the most effective form there can be no distinction of master and men. Where responsibility is uneven, the burden naturally rests with the so-called masters who have the advantage of their position and education, which gives them a clearer insight into the difficulties now confronting us all.

How may a realization of this truth be best brought home to everyone, in order that results may follow equal to the emergency and develop the highest type of loyalty? To my mind this question is best answered by an explanation of several campaigns which have recently been conducted in this and other mining districts, each embracing different lines of endeavor and all converging to the same end.

The first was a Y. M. C. A. war-fund campaign. Raising money for patriotic purposes is not a novel undertaking for this organization. The proposition, in this instance, was so extensive in its application that it justified an appeal to every class of citizens. As we happen to be located in a mining community there were few workers or employers who were not solicited. The result was gratifying, indeed, but it was felt that even more could have been accomplished.

The first Liberty Loan campaign was next begun. At all mines in this region the work was pushed with commendable zeal and, as the world knows, the desired amount was far oversubscribed. It was significant, however, that in withdrawing the excess subscriptions the Government limited the refunds to purchasers of $20,000 worth of bonds and upward.

When it came to launching the second Liberty Loan subscription it was evident to the mining managers who had taken direct interest in this work (and be it said they were most efficient and commendably active) that something had to be done to break down the barrier that unmistakably existed between them and the so-called foreign class of workers.

The recognition of this fact supplied the first step in advancing mutualization, and it brought actively into the field the assistance of the officials of the United Mine Workers, who were eager to do their bit. In this district a number of meetings were held where the coal company and the union officials sat on the same platform with the mine workers, and results were far more successful than in either of the previous campaigns.

Special Efforts Made To Interest Foreigners

This was followed by another war-fund campaign conducted by the Knights of Columbus, which was similar to that of the Y. M. C. A. campaign. A change of method was again adopted, in that the managers of this campaign took another course to educate the foreign element, whom they knew were just as loyal and equally anxious as their fellows to do their share if properly approached. The pastors of the various churches were first called upon and their active coöperation was secured without difficulty. The success of this last campaign was most astonishing, since it included in the list of subscribers 85 per cent. of the foreign population. Other campaigns followed, such as the Red Cross and kindred funds, each of which found the work greatly facilitated by what had gone before.

I have detailed this somewhat in order to make clear the point that "mutual capitalization" can be done with complete success but only by an active campaign, wherein the mine owners and mine officials who have been most active in formulating plans for patriotic work will forget their titles, divorce themselves from the professor's chair and join in an out-and-out mutualizing campaign.

It is idle to say that the spirit of equality prevails, or that those who know best how to work have been willing to do missionary duty of this sort. They have not; and until they come to a definite decision in this respect, and go out and solicit aid from those who have real influence with their employees, we shall continue to have "Plough Mondays," Little Christmas, Ducking Days, protracted paydays, big heads and a reduced coal production.

The officers of the United Mine Workers have shown their sincerity in endeavoring to increase the produc-

tion of coal. They have exhorted their followers to stay on the job; they have addressed meetings; instructed local leaders to be active and persevering; and in the larger conferences with Conciliation Boards, Government representatives, fuel administrators and operators' committees have given every assurance of their securing a maximum output at the mines.

Let me ask, in closing, Why should this work be left exclusively to these men? Are the mine owners and mine officials willing to admit the intellectual superiority of the union leaders? It would appear so, and yet it is safe to say that a new and improved method can be evolved if those brilliant men who officer the coal companies of the anthracite districts will take an active interest and give a helping hand. It is evident that there are many ways in which this mutualizing can be brought about; but as an individual I would hesitate to offer any suggestion beyond recommending the most serious consideration of the proposition, on the part of all mine officials. They are urged to take this matter up seriously, and open negotiations with the end in view of improving the intimacy of district, local and mine officials, which will eventually bring Yonko, Antonio and Koziusko into the field of educational endeavor for mutual capitalizing. W. E. JOYCE.

Sandy Run, Penn.

Relative Size of Intake and Return Airways

Letter No. 3—Referring to the discussion in regard to the relative sectional areas of intake and return airways, I feel somewhat like F. E. Schroyer, *Coal Age*, Jan. 5, p. 32, who prefers to make the haulage road the larger, regardless of whether it is the intake or the return airway of the mine.

Theory has always answered this question by referring to the increased volume of the return air current, which is due to its generally higher temperature and the presence of gases generated in the mine. The correctness of this assumption cannot be denied, but there are practical reasons that seem to overbalance these conditions and require that the intake airway, when used as a haulage road, should have a larger sectional area than that required for the return current.

This question, to my mind, is a very important one, especially at this time when so many new mines are being opened around the country. These are often in charge of young men of limited experience in mining. I would like to see the matter thoroughly discussed by older and more experienced men than myself, as there is weight of argument on both sides of the question.

In respect to this matter I am inclined to reason about as follows: Assuming that the main haulage road is the main intake airway, in a mine where motor haulage is in use, let it be supposed that a 20-ton motor is employed and hauls trips of, say 25 cars in and out of the mine, or there may be two of these motors in use. There is usually one trip of cars standing on the siding or at the shaft or slope bottom, while another trip is moving on the airways.

We may assume that the clear sectional area of the airway is 70 sq.ft., of which the motor and trip take up about 21 sq.ft., leaving a net area, for the passage of air, of 70 — 21 = 49 sq.ft. I will assume that the original velocity of the air passing into the mine is 900 ft. per min., which would give 900 × 70 = 63,000 cu.ft. of air in circulation.

Now, my idea is that a motor trip standing or moving in an airway blocks the air very much as a box regulator, which increases the velocity of the air passing, while it decreases the sectional area. Then, let me assume that the velocity of the air passing a trip of cars is increased to, say 1000 ft. per min., the effect of which is to reduce the quantity of air in circulation to 1000 × 49 = 49,000 cu.ft. per min. On this basis, the loss in circulation would be 63,000 — 49,000 = 14,000 cu.ft., or over 22 per cent.

In my experience in charge of mines, I have observed a similar decrease in the circulation of air on main haulage roads when a driver was coming against the air. If that is true in the case of a driver, it may be supposed that a fast-moving motor trip will have an even greater effect. The question is, how far do these facts hold in affecting the general circulation of air, in a mine where the haulage is performed on the intake airway? AN INTERESTED FOREMAN.

McIntyre, Penn.

[This is an excellent question for discussion, and there is no doubt that there are many important points to be brought out and remembered, affecting the problem. Indeed, no absolute rule can be given that will fit all cases. The best that can be done is to draw attention to the so-called theory of the increased volume of the return current, demanding an increased sectional area of the return airway; and the practical requirements of all main haulage roads, calling for a safe clearance at the side of the track, when considering the resistance offered by moving trips of cars.

In general it is needless to discriminate between the two cases, whether the haulage is performed on the intake or the return airway of a mine, since the empty and loaded trips pass in different directions going in and out of the mine; and while their movement resists the flow of the air when going in one direction, it assists the air movement when going in the opposite direction. These two conditions would almost balance each other, in respect to the general circulation in a mine, except for the fact that the loaded trips create a possibly greater resistance than that produced by the empty trips, which would be the case when haulage is performed on the intake airway. This difference, however, has a comparatively slight effect on the general circulation.

AN ERRONEOUS ASSUMPTION

The suggestion is offered that a motor trip standing or moving in an airway acts very much as a box regulator, increasing the velocity of the air passing, while decreasing the area of passage. It is a mistake, however, to estimate this increased velocity as being only 1000 ft. per min., in the case assumed by our correspondent, the original velocity being 900 ft. per min. This is pure assumption and not in keeping with the actual facts.

The question of how much the general circulation of air is decreased by a trip of cars moving against the air current can only be correctly estimated in a manner resembling that of a movable piston in a cylinder having

a larger sectional area than the area of the piston. The effect is to set up a local dynamic equilibrium between the energy of the air current, which is opposed and equal to the energy of the rush of the moving cars transmitted to the air about it.

That would be a difficult question to solve satisfactorily; but, as previously stated, the effect on the general circulation of the mine, owing to the movement of the trips in opposite directions, is so slight that it may be practically ignored. In other words the actual effect, as observed by the anemometer readings mentioned, is only temporary and counterbalanced when the conditions are reversed by the trip running in the opposite direction.

This resolves the question into one of increased volume of the return air-current, requiring an increased area of that airway, without regard to whether it is the haulway or not. The question of providing a safe clearance on the haulway is another consideration aside from that of ventilation.—Editor.]

Miners and the War

Letter No. 6—I have been greatly interested in the letters relating to the attitude of miners in respect to the war. In a few instances the miner has been charged with a lack of patriotism. Some writers seem to imply that the miner is getting rich quick, owing to the increase in wages granted him.

Since like increases have been granted working men in all trades and industries, the miner is not alone in this respect. The increase is a recognition of the character of the times and has become a seeming necessity, because of the very large increase in the cost of living. Wage increases are, also, the worker's just share of the largely increased profits that have come through the amazing expenditure of money in the present crisis.

The trend of affairs in the industries of the country causes the thoughtful man to stop and consider what is to be the outcome. The process of increasing prices and then increasing wages to meet them, it is certain, cannot go on forever, and retrenchment will surely come when the difficulty will be to reduce wages without causing a serious disturbance in the labor world. There is such a thing as killing "the goose that lays the golden egg," and we may yet see the application of this old adage.

True Attitude of American Labor

The time has come when labor, in this country, can and should meet all conditions with a thoughtfulness that is unknown in other countries. American labor is possessed of a generally high-average mentality, and this, together with the fact that the true American is animated at the present time by a real spirit of patriotism, will greatly assist in avoiding trouble when affairs take on a different aspect and there is the necessity for curtailment.

In this connection mention has been made of the injustice that is done to that large class of clerks and other salaried men, many of whom are still working for the same salaries that they have been receiving for years past, notwithstanding the fact that they have to stand the same high cost of living as other workers whose wages have been increased.

This is something for all employers to think about. I believe that the average employer does not desire to make a fortune at the expense of a few of his employees. He desires to do the fair thing by all of his men; but these inequalities are largely the result of oversight or thoughtlessness on his part.

I recall reading in *Coal Age* a short time ago an excellent article by an anthracite superintendent [Dec. 15, p. 1008]. The article ought to be read by all superintendents, who should consider carefully the suggestions made. No one who is familiar with the situation here in the anthracite field will imagine for a moment that a man holding a position as superintendent of a large colliery would make these suggestions, unless he felt that they were of the greatest importance to the coal industry. Nor will anyone familiar with conditions existing in and around the anthracite mines fail to understand what that superintendent said about national prohibition bringing a large increase in the production of coal and greatly lessening mine accidents.

Somewhere I have read the statement that 85 per cent. of the men working in and around these mines are given to overdrink on payday and are unfit for work for days afterward. I cannot let this statement go unchallenged, as it is untrue. We all know perfectly well that there are men in every colliery and mining camp who drink too much and are unfitted for work for several days following payday. It is true, also, that the total number of days lost to coal production in a single colliery or field is formidable, but it does not reach the percentage indicated by my former statement.

Problem for Mine Officials

This waste of man-power and production is a matter for superintendents and foremen of mines to consider and take steps to eliminate. It is idle to talk about sacrificing and saving coal and then overlook the weightier matter that causes such a great loss in coal production as the presence of the saloon in mining camps. Think of schools, in the heart of the anthracite coal fields, being closed down to save fuel, depriving the miners' children of the chance of an education, while their fathers are grouped around a hot stove in a barroom, making themselves unfit for work and proving a real loss to the production of coal.

By ridding the mining camps of the saloons, hundreds of thousands of dollars would be saved to the company. The saloon is the last thing the miner sees in the morning when going to work and the first thing he strikes on his return from the mine. There ought to be ways and means of approaching this question through the courts, since it is a matter that should be subject to regulation by the Government in the efforts made for conservation and increased production.

It is my belief that most, if not all, miners are true Americans, in this war. What is needed is leaders, whether in the form of company officials or the officers of their union. In order to enable the miner to do his part all must unite in a war-saving plan, with the details of which every mine worker should be made familiar. Nothing can do this more effectively than for officers and men alike to coöperate in the work, shoulder to shoulder, for the same great end.

The public should cast aside the idea that the miner is thriftless and extravagant. Readers of the daily press should not be misled by the foolish tales that appear, from time to time, in its columns. Only a

few days ago the *New York American* printed an item stating that the head of a large coal firm, owning mines in and around Wilkes-Barre, drifted into his own company store, bought a 5c. cigar and started to smoke, when he was accosted by a miner with the words: "Stranger, throw away that butt and smoke this real cigar. It's a 40-center." Another item stated that a Philadelphia florist, who had filled several out-of-town orders for chrysanthemums, found, on investigation, that they were going to miners' homes. Such talk, as it relates to the average miner, is mere twaddle.

Regarding the patriotism of miners, let me say that, as an American miner, my patriotic feelings have been sorely strained by the conditions at the mines during the past two weeks. My output in that time fell from a possible 250 to only 100 tons of coal. I have been to the mine three days in succession without being able to work a shift; and yet during all that time the mine worked 8 hours each day. A MINER.

Kingston, Penn.

Blacklisting To Prevent Accidents

Letter No. 7—I have been reading with much interest the arguments advanced by different writers for and against the blacklisting of careless miners as a means of preventing accidents, but not a word is said in favor of blacklisting a careless fireboss, assistant mine foreman, foreman or superintendent. Are not some of these men as careless, at times, as the average miner? If so, why not blacklist them as well as the miner? I know we have some mine officials who are equally as careless as the miner they employ.

It does not seem to me a fair proposition, however, to blacklist men for an infringement of the mining law or for being careless and I believe it would be illegal. No one ever talks of blacklisting the man who violates other laws of the state. Why, then, blacklist him for violating the mining laws? If a man commits a crime he is arrested and punished for his misdeeds according to the law.

What right would a mine foreman or other mine official have to discharge a man and blacklist him for carelessness or for breaking the rules of the company or the laws of the state? Are mine officials constituted judge and jury? The man found guilty should be reported to the mine inspector who is the proper authority in this case, and let him punish the offender according to law.

Blacklisting Wrong in Principle

If the blacklisting of men was permitted and put into force it would be a vicious and dangerous practice as it would give one man, and perhaps an unscrupulous one, power to injure another without giving the latter any opportunity to defend himself.

One writer states, *Coal Age*, Jan. 12, p. 74, "Lack of discipline on the part of mine officials is responsible for much carelessness on the part of miners." But, lack of discipline on the part of the man having authority to enforce discipline is nothing less than carelessness, and he is therefore responsible for the act of the miner, and is the one, if any, to be blacklisted. But I say, blacklist no one, it is contrary to all the principles of law and justice. Punish a man for his misdeeds and then send him back to his work and he will seldom give further trouble.

No one would think of blacklisting a soldier for carelessness or for some breach of discipline; he is court-martialed and punished, according to the seriousness of his offence, and is made a better soldier after he has been taught a lesson in discipline. In the same manner, every man should have a chance to defend himself before the legal authorities for any careless act that he has committed in or around the mine.

All men working in and around mines are working under the state mining law and are answerable to the state authorities for any violation of that law and that should be the only way to punish them. I am not, in any manner, trying to defend the careless miner or mine official but am objecting to the method that has been suggested for punishing them by blacklisting.

Uniontown, Penn. JUSTICE.

Letter No. 8—Referring to the suggestion of blacklisting men found guilty of acts of carelessness or disobedience to orders, allow me to say that I hope and trust the day is not far distant when the name or thought of "blacklist" will be forgotten and banished forever. In my opinion it is not worthy of any consideration in the minds of thoughtful men.

No one can deny that there are many careless men employed in and about coal mines and that their acts may be the cause of serious accidents. Observation and experience, however, force one to the conclusion that more accidents occur in mines as the result of the failure of mine officials to install the necessary appliances or perform the work required to make the mine safe than are caused by the neglect or carelessness of miners. From the general manager down to the assistant foreman, the disposition of mine officials in most mines is to make every requirement of safety subordinate to reducing the tonnage-cost for the mine.

The Daily Press on Mine Accidents

A miner may be injured or killed by a fall of slate, and the accident is heralded in the newspapers as the result of the poor miner's ignorance or recklessness. It is even made to appear, to the eyes of the public, as approaching a case of suicide. But, were the real facts known, in many cases the blame for the accident would be laid at the door of the management for its failure to supply the necessary timber to make the working places safe.

Where these facts are true, as they are in many instances, the method of blacklisting men for accidents would generally be unjust; many innocent men would suffer for what was not primarily their fault. Where safety is the first consideration in the mind of a management, there are always fewer accidents recorded against the mine.

It is the tendency of many mine officials to put off for tomorrow what should be done today. This is the cause of many mine accidents that leave children fatherless and deprive wives and mothers of their support. Untold loss and sorrow are the results of these accidents, many of which are avoidable. There is loss to the company by whom the man was employed and sorrow to his family. Let the blame be placed where it belongs.

Nanticoke, Penn. W. A. BARRETT.

INQUIRIES OF GENERAL INTEREST

Treatment of Impure Feed Water

At present much time is being lost in the operation of mines in this district, by reason of the scarcity of water to feed the boilers. Owing to the continued severity of the weather, the reservoirs and other sources of water supply at the mines have failed, many of them being almost frozen solid.

The mines, at the same time, appear to be making about the usual amount of water, which drains into the workings and must be removed by pumping. In its passage through the strata, this water has often absorbed so many impurities that it is unfit for use in the boilers, and must be allowed to run to waste, unless some practicable means can be found for removing the impurities and making the water fit for service.

Any information that *Coal Age* or its readers can give in regard to the character of the impurities that are most harmful in boiler practice and means for their removal, will be of great interest to many readers.

Linton, Ind. W. H. LUXTON.

The scarcity of water supply at the mines is quite general throughout the country, at this time, and more than one mine has faced the alternative of using the impure water discharged from the pumps, or closing down till a supply of water could be obtained suitable for use in the boilers.

The impurities contained in mine water may be mineral salts, as carbonates or sulphates of lime, magnesia, iron, sodium or potassium, dissolved from the rock formations and held in solution by the water as it drains into the mine; or sediment held in suspension, as organic matter, mud, or other foreign substance washed from the strata.

In the boiler, these impurities do not escape with the steam but remain in solid form and incrust the inner surface of the boiler and the tubes with a scale of varying hardness depending on the character of the ingredients. The formation of scale in a boiler not only reduces its capacity for generating steam, but retards the transmission of heat from the furnace to the water and causes the overheating of the boiler plates and endangers the boiler from the bulging of the plates or the forming of blisters.

The treatment of impure boiler feed waters may be classified under three heads: (1) Chemical; (2) thermal; (3) mechanical.

1. The presence of mineral salts or free acid in feed water requires chemical treatment to effect the precipitation of the salt or the neutralization of the free acid. This is accomplished by means of so-called "boiler compounds." No boiler compound, of which there are many on the market, however, is of general application, and the only safe rule is to have a competent chemist analyze the water and recommend the proper treatment. Without such analysis and competent advice, the use of a boiler compound recommended as having proved efficacious in one or more instances, may do more harm than good.

Many boiler compounds are designed to form, by chemical reaction, a new salt that will not make as hard a scale but one that is readily removed, either by blowing off the boiler at intervals, or by the use of scrapers when the boiler is out of use. Other compounds contain substances that coat the crystalline precipitate with a film that prevents their cohering and forming a solid scale. A small quantity of kerosene added to an impure feed water will often have the same effect in preventing the consolidation of the carbonates of lime and magnesia precipitated by the heating of the water, but the use of oil, except in very small quantity, may coat the boiler with a thin film that tends to decrease its steaming capacity slightly.

2. The carbonates of lime and magnesia are held in solution in water containing an excess of carbonic acid. When the water is heated to boiling, the free acid is expelled and these salts are precipitated. This makes it possible to purify such waters, by heating them in large tanks or feed-water heaters, and then allowing time for the precipitated salts to settle before pumping the water into the boiler. This process is known as the "thermal treatment" of feed water.

3. When a feed water contains sediment, as mud, sand or organic matter, this can often be separated by running the water first into large settling tanks and allowing sufficient time for the sediment to settle before using the water. The heavier matter, sand and mud, can generally be separated in this manner, but light organic matter will often require filtering the water through a specially prepared filtering tank or basin.

It has at times been found advantageous to install a purifying plant, which combines any or all of these means and processes, where it is necessary to use large quantities of an impure water. The installation and operation of such a plant will often prove a large saving in expense, which would result in attempting to operate the boilers without first purifying the feed water.

Impure feed waters act in three ways to cause trouble in boiler practice, according to the character of the impurities they contain. (1) Such water may simply incrust the boiler by forming scale of varying hardness and which must be removed from time to time. (2) The water may be corrosive in its action and attack and eat away the metal and thus weaken the boiler. (3) The impurity in the water may be such as to cause priming, by which water would be carried over from the boiler into the cylinder of the engine.

Feed water containing carbonates of lime and magnesia or iron are prone to form scale; and a feed water containing organic matter, chloride or sulphate of magnesia and some free acid, will corrode the boiler; while water containing sodium carbonate or other alkalies and organic matter induce priming.

EXAMINATION QUESTIONS

Indiana Mine-Bosses' Examination, Vincennes, Jan. 17, 1918

(*Selected Questions*)

Ques.—What factors of safety should be kept and maintained at the surface landing where miners are being lowered or hoisted out of mines?

Ans.—The means of safety, or safety appliances, that should be kept at the surface landing of a shaft or slope are the following: (1) Safety blocks to prevent cars running into the shaft or slope. These blocks should be arranged automatically so that when released they will fall back into position to stop cars from running past them. (2) A derailing switch, which should also be automatic and set for the sidetrack, except when in use to take cars into the mine. It is a good plan to have the grade rise slightly toward the shaft, so as to prevent surface drainage finding its way into the mine. (3) The head of a shaft should be protected by automatic safety gates so arranged as to be operated by the cage, rising with the cage as it reaches the surface and falling again as it starts to descend in the shaft. (4) There should be speaking tubes or other means of communication between the head of the shaft and the engine room and the shaft bottom.

Ques.—(a) What effect does a misplaced shot have in the presence of firedamp? (b) In the presence of coal dust?

Ans.—(a) A misplaced shot when fired may produce a considerable quantity of flame, which is projected from the hole as the result of the shot blowing the tamping from the hole or an overcharge of powder crushing the coal into fine fragments. In either case, the projected flame would ignite any accumulation of firedamp in the place and a more or less local explosion of gas would occur.

(b) Where a shot is misplaced or overcharged and a blownout or windy shot occurs, in the presence of an accumulation of coal dust, the latter is thrown into the air and ignited by the flame of the shot, producing a local dust explosion that may or may not be propagated throughout the mine, depending wholly on conditions in the workings.

Ques.—What methods would you adopt to protect surplus powder?

Ans.—No surplus powder should be kept on hand in the mine. Safety requires that the miner should take into the mine only sufficient powder for the day's supply, and this should be kept by itself in a box that is securely locked. Strict regulations should be enforced, in this respect, throughout the mine.

Ques.—What instructions would you give and what precautions would you take, as mine boss, to prevent accidents through shotfiring?

Ans.—Shotfirers should be instructed not to start to fire shots until all persons have left the mine, except themselves. They should begin firing on the end of the air and proceed in regular order, advancing against the air current. Each shotfirer should only fire the shots in his own section of the mine. Two shotfirers should not work together in the same section. Shotfirers should fire no shots that, in their judgment, appear to be unsafe. When firing shots in any place, ample time should be given for the air current to clear away the smoke and gases that may have backed into the place from the shots previously fired in an adjoining place.

For the protection of shotfirers, a mine boss should employ only competent men for that work and should give them authority to refuse to fire any shots that, in their judgment, are unsafe. Greater safety is insured where the shotfirers are required to examine, charge, tamp and fire all holes drilled by the miner and which they consider safe. The mine boss should divide the mine into sections of such size that the firebosses can complete their work in the prescribed time, without being required to do the work too rapidly. As far as practicable, permissible powders should be used in blasting and strict regulations should be made and enforced governing the entire work.

Ques.—(a) What per cent. of air is oxygen? (b) What is the difference between a dangerous atmosphere and a fatal atmosphere?

Ans.—(a) Oxygen forms 20.9 per cent. of air, by volume; and 23 per cent., by weight. Thus, 1000 cu.ft. of pure dry air contains 209 cu.ft. of oxygen; or, 100 lb. of pure air contains 23 lb. of oxygen.

(b) A dangerous atmosphere is one that approaches the danger limit, owing to its being charged with gas or dust, to such an extent that ignition is liable to occur in the ordinary operation of the mine, either from blasting, the sparking of electric wires, blowing out of fuses or the use of open lights, or a defective safety lamp. An atmosphere may become dangerous by the presence of poisonous or irrespirable gases, or an insufficient amount of oxygen.

A fatal atmosphere is one that would cause death if breathed in sufficient quantity for a sufficient length of time. An atmosphere may be considered as fatal when it contains a sufficient percentage of explosive gas to cause a fatal accident.

Ques.—How many tons of coal in a 5-acre block of coal 6 ft. in thickness, assuming there are 27 cu.ft. in 1 ton, and allowing 20 per cent. off for waste?

Ans.—The cubic contents of this seam is $5(6 \times 43{,}560) = 1{,}306{,}800$ cu.ft. Then, allowing 20 per cent. off for waste leaves 1,045,440 cu.ft. Finally, allowing 27 cu.ft. per ton gives a total tonnage in this tract of $1{,}045{,}440 \div 27 = 38{,}720$ tons.

The above calculation gives a result that is rather in excess of the weight of coal usually recovered, under ordinary mining conditions, although with a proper system of mining it may be obtained. A common rule is to allow 100 tons of coal per inch-acre, which would give, in this case, $5(6 \times 12 = 100) \times 36{,}000$ tons.

COAL AND COKE NEWS

Harrisburg, Penn.

Overshadowing the inability of the railroads to move coal quickly from mine to market, a water famine has tied up several big collieries in the Schuylkill region. About a dozen collieries are on the verge of a shutdown for the same reason. The scarcity of water has crippled the production of coal seriously since the severe cold weather began.

Thousands of loaded cars have been held in classification yards and on sidings. The congestion, however, is gradually being cleared by the aid of high officials of the railroad companies, who are taking personal charge of affairs and staying "right on the job." Zero weather has frozen reservoirs and streams from which water is drawn for steam purposes. The water situation in the Wyoming and Lehigh fields is reported to be good. This difficulty was overcome years ago by some of the coal companies who put down wells on their properties.

Labor leaders in the anthracite belt who are keeping in touch with the convention of the miners in session at Indianapolis express themselves as well pleased with the vote on the proposition of permitting other districts to take part in the formation of a basis wage scale. The vote was of vital interest in the hard-coal fields, as the entire system of dealing with the coal operators was at stake.

President Dempsey of District No. 1 presented that side of the situation in a lengthy speech. The carrying of the insurgent proposition would have given the soft coal men a right to be in on the settlement of the rates for the anthracite district. This is the domination that the hard coal operators have always fought against and would have, if carried out, ended the status that has made possible an avoidance of industrial conflict during a long period of years.

After five months' investigation of the anthracite situation in the interest of the consumer, former State Representative Frank C. Reese charged on Jan. 25 that the anthracite operators are perpetrating on the public the most "damnable gouge" in history.

Mr. Reese is a Pottsville business man and knows the practical side of the coal business. He charges that the Federal Fuel Administration is permitting the anthracite combine to sell as coal "everything that's black," at the exorbitant fixed rate of Government regulation.

With the transportation systems clogged and many cities suffering for want of coal, Mr. Reese discloses that the vaunted overproduction of the coal mines is merely the production of refuse and dirt.

"From 30 to 40 per cent. of coal going to the market today," Mr. Reese said, "is but refuse. This slate, bone and dirt, with which coal is being adulterated at the highest prices in history, is clogging the railroads and giving but half the heat which the same amount of real coal would give. It is the most damnable gouge in the history of the coal fields."

Mr. Reese finds that the washery coal which is sold as pea coal costs the operator but 20 to 25c. to place on cars. "And then it is coal that he cannot use," is Mr. Reese's comment. "A washery has a gold mine beaten," Mr. Reese continued; "I know of men who are cleaning up from $150 to $200 a day on an investment of nothing."

At a meeting held during the week by the Board of Trade of Scranton and officials of a number of coal companies mining in Lackawanna County, some of the details of the mine-cave solution plan were threshed out. The plan of settlement of the problem was considered last week at a meeting of the heads of coal companies in New York. It is expected that another conference with the presidents of the leading coal-mining companies will be held in the near future.

The plan submitted is said to provide for the levying of a tax on every ton of coal mined, the proceeds to be used to prevent caves and repair damages to buildings above ground, if such damages occur. A spirit of willingness on the part of the operators to consider the plan of the committee and discuss all questions in dispute in a friendly way was evidenced, when the conferees on both sides organized as a joint committee and elected John H. Brooks chairman.

The board committee does not assume that it can settle the problem of itself, but will endeavor to get the best offer possible from the operators.

The operators were represented at the meeting by W. W. Inglis, vice president of the Delaware, Lackawanna and Western coal department; Charles Dorrance, general manager of the Delaware & Hudson Co.; W. L. Allen, vice president of the Scranton Coal Co.; W. L. Connell, president of the Green Ridge Coal Co.; Joseph P. Jennings, general manager of the Pennsylvania Coal Co.; John G. Hayes, vice president of the People's Coal Co.; David Spruks and Cornelius Comegys, of the Bulls Head Coal Company.

Hundreds of Scranton property owners in that fortunate area comprising more than half the built-up section of the city that is covered by the Supreme Court decision in the Penman vs. Jones "third estate" case, have availed themselves of the opportunity to reattach to their properties the right of surface support, which they waived in the old deeds received from the Lackawanna Coal and Iron Co. The "third estate," under the Supreme Court decision, is vested in the Scranton Trust Co., and that company may sell or convey it. The court ruling also fixed that to get the benefit of the right it must be reattached before the support is removed, and the shrewd property owners are hastening to buy it before the present big demand for coal results in more extensive pillar mining.

During the week several conferences were held between State Fuel Administrator Potter and a number of soft coal operators' representatives, as well as with railroad officials, and it has developed that the kernel of discussion was the advisability of introducing soft coal for householders. It is the intention of the fuel administrators to recommend to the people the using of soft coal, not to take the place of anthracite entirely, but to simply aid in supplying the demand that cannot be filled by anthracite.

How soon soft-coal shipments will begin to flow in no one is ready to say. The reason for turning to bituminous is obviously a matter of supply, bituminous operators hold. Eight times as much soft coal is mined as anthracite every year. More than 60,000 tons of bituminous is mined in central Pennsylvania. Anthracite operators acknowledge they are at the peak of their production. Soft coal men admit the capacity of their mines is going to waste from lack of enough cars and locomotives to haul the coal away.

In the state, during 1917, there were 3748 men killed in the mines, in industries and on public service lines, as against 2814 in 1916. These were divided up as follows: Mines, 1166; industries, 2136; public service lines, 448. In 1916 fatalities were divided up as follows: Mines, 1059; industries, 1225; public service lines, 350.

Luzerne leads the counties of the state in mine fatalities with 222; Schuylkill is second with 161, and Lackawanna third with 151. In industrial fatalities, Allegheny is far in the lead with 336; Philadelphia is second with 268, and Delaware is third with 110. In the anthracite mines 612 men were killed, while in the bituminous field 554 were killed.

PENNSYLVANIA

Anthracite

Wilkes-Barre—Among the changes made recently in the executive department of the Lehigh and Wilkes-Barre Coal Co., the most important was the appointment of William James, of Plymouth, to succeed the late Michael Flaherty as superintendent of preparation. The position carries with it full charge of the preparation of coal in the nine collieries and two washeries of the company in the Wyoming field. Mr. James is 32 years of age. New appointments in the engineering department, all effective from January 1, are: Harry E. Owens, district engineer, Wilkes-Barre district; John B. Tambyln, district engineer, Sugar Notch district; Roland G. Carpenter, district engineer, Plymouth district.

Frank G. Nicholson, a former engineer in the mechanical engineering department, has been appointed as electrical engineer, having supervisor's control of electrical construction and electrical apparatus at all operations of the company. A. H. Partridge, one of the engineers in the department, was promoted to acting mechanical engineer in charge of the mechanical engineering department during the absence of J. H. Doughty, who has entered the military service as captain of engineers' corps.

Pittston—"Somewhere in the Barnum Mine" was written on the envelope addressed to Frank Cicoski, whose questionnaire was sent to him but was returned with above address to the exemption board. This proved to be true, as on Jan. 21 his remains were found under the cave that occurred at the Barnum mine on Jan. 5, the shift about to quit at 11 p.m. having found the body. Decomposition had set in, and early in the afternoon the odor arising therefrom indicated to the state inspectors and company officials that the body must be there. When found it was covered under a quantity of coal. It is supposed that Cicoski had got confused in trying to make his escape and that he ran right under the fall instead of making his way out with the other men who escaped to a place of safety. Deceased was 24 years old.

Dorranceton—Three collieries in Wyoming Valley—the Franklin and Prospect of the Lehigh Valley Coal Co., and the Pettebone of the Delaware, Lackawanna & Western Railroad Co.—operated in whole or in part on Sunday, Jan. 20. This Sunday work in producing coal is almost unprecedented in the history of the anthracite coal region. There was no mining of coal by the Lehigh Valley Coal Co. The breakers of the two collieries mentioned were operated to prepare coal from the William A. breaker, which had accumulated during the week, the William A. breaker having burned down a week or so ago.

Beaver Meadow—The new Evans colliery will be placed in operation about Feb. 3. The contractors have completed the new breaker, and only a few details are necessary to place the colliery in full operation. Starting at a time when the scarcity of coal is sorely felt, the new firm hopes to be able to help relieve the fuel famine by operating the new plant to its greatest capacity.

Scranton—Deeds were filed on Jan. 24 conveying the title of the property of the Coal Lands Securities Co. on Lackawanna Ave. to the Delaware, Lackawanna & Western Coal Department. The new building is to house the coal company offices.

Edwardsville—The Kingston Coal Co. is offering to its employees instruction in mining, mathematics, the common branches, and English to foreigners. Employees should take advantage of this opportunity and attend regularly the evening schools at the company's library on Main Street.

Dunmore—In an effort to increase the coal production as much as possible, several thousand miners employed by the Pennsylvania Coal Co. at its 14 collieries have signified their willingness to work nine hours a day. Frank H. Coughlin, assistant to the president, states that the agreement of the men to increase their working day one hour is a mutual one. "Officials asked the men to work and the employees displayed true patriotism in immediately offering to labor an additional hour." The company expects to greatly increase the tonnage by the men working nine hours instead of eight hours.

Pottsville—A tax of $500 on a deed to property worth $500,000 was paid at the courthouse on Jan. 24 by J. Claude Bedford The tax is for internal revenue on 1500 acres of coal land sold by Fred A. Delano to the New Boston Land Co. The new concern will merge interests which will obviate the necessity of the maintenance of expensive barrier pillars.

Gowen City—The water famine has become so acute that the Roaring Creek Water Co., controlling the supply for domestic and commercial uses, on Jan. 24 notified all coal companies that unless there is rain or a thaw within five days the water supply to the collieries in Northumberland County, already seriously affected, will be reduced 50 per cent. Arrangements are being made by the mining companies to purify mine water for steam and coal-preparation purposes. To do this enormous quantities of lime and soda ash will be required. Officials say the water shortage has never been so acute and fears are expressed that a reduction in the output is inevitable.

Mount Carmel—The entire staff of chemists of the Philadelphia & Reading Coal and Iron Co. is making tests of the mine water at all collieries in this district in a hope that they may devise some chemical process through which to eliminate acids from the water so as to protect metal in machinery in the event that it becomes necessary to use the mine water in the preparation of coal. The water famine is becoming more serious, and it may be necessary to resort to the use of water pumped from the mines.

Throop—A hero medal has been awarded to Mrs. Daniel Thomas, for the heroic act of her husband who gave up his life in attempting to rescue two fellow workmen in the Mount Pleasant mine. The medal was donated by the Carnegie Hero Commission of Pittsburgh, which also awarded a cash consideration to Mrs. Thomas and her three-year old daughter.

Jeddo—The G. B. Markle Co., largest individual coal operator in the state, has started the erection of a steel washery through which a number of culm banks will be prepared for the market.

Drifton—Officials of the Lehigh Valley Coal Co. on Jan. 24, solved the problem of transportation of workmen from Hazleton to its North Side strippings and collieries, by the purchase of two of the trolley cars owned by the Lehigh Traction Co. The workmen who will use these specials are all employed at the Lattimer strippings, No. 9 and Drifton and Wolfe collieries. For some time the Lehigh Valley has been experiencing considerable difficulty with the transportation problem and it was met in this fashion. The cars were sold by the traction company, who will continue their operation for the coal company at special periods.

Stockton—Another tap has been made in the barrier pillar of the old Stockton mine, that will permit a greater flow of water from the flooded and abandoned mines to the sumps in adjoining mines. The successful entrance into the flooded region was made on Jan. 23, by using the same methods that were followed out several years ago. The added hole was obtained by the means of boreholes and gives a huge volume of additional water to the sump in other operations. The hole, as previously driven, while draining the mine, was not sufficient to reduce the levels to any appreciable degree.

Freeland—In order to keep his men employed, General Manager Jessup, of the G. B. Markle Coal Co., is having thousands of tons of prepared coal dumped into empty breasts. The company is swamped with orders, but railroad congestion hampers delivery.

Hazleton — The Lehigh Valley Coal Co. has discovered a way to avoid the delays due to the freezing of fuel brought from mines to the central breakers in the Lehigh region. A steam-heating shed has been erected there and in this cars are kept overnight. Similar plants will be built at other mines in the Wyoming and Schuylkill region.

Through arrangements made with the officials of the above mentioned company, Miss Anna Bock, of the coal company's welfare staff of nurses, has been added to the force of the Hazleton chapter of the Red Cross. During the period of the war the local chapter has received many calls for aid from families of men who have joined the colors. Those will be looked after by Miss Bock and her corps of nurses. Miss Bock is well trained for this class of work. Prior to entering the employ of the Valley coal company in its welfare department, organized when the compensation act went into operation, she was engaged in charity work.

Bituminous

Clearfield—The motor house of the Clearfield Bituminous Coal Co., in Rossiter, was dynamited recently, damaging four large locomotives used to haul cars from the mine, and burning the building. The 1800 men employed in the mine were thrown out of employment.

Connellsville—Two hundred and fifty cars of coal in the yards of the Baltimore & Ohio R.R. here was seized on Jan. 23 by D. W. Kuhn, fuel administrator for the Pittsburgh district. The coal was to be sent to plants of the Jones, Laughlin Steel Co., of Pittsburgh, which is working on war contracts. The coal supply of the steel company from its mines in the upper Monongahela Valley has been tied up since the first of the year by ice in the river, which prevents the movement of barges.

WEST VIRGINIA

Maitland — The tipple of the Houston Colliery Co., at Maitland, in the Pocahontas district, was burned last week by a fire believed to be of incendiary origin. This makes the fourth suspicious fire which has destroyed tipples in that field in the last two months.

Downs—The Rachel Coal Co. is erecting 25 new houses for the use of its employees at Downs, Marion County.

Teter—The Hercules Coal Co. is getting ready to sink a shaft in its coal land near here. The tract has been thoroughly tested, and it is the intention to follow up with the development work in the near future.

Weston—R. Bates Wooters, of Clarksburg, has sold his coal lease to the West Virginia Fuel Co. The purchasers are Fairmont men who contemplate early development.

TENNESSEE

Knoxville—From 10,000 to 15,000 coal miners in the Southeastern Kentucky-Tennessee field worked at digging coal on Sunday, Jan. 20, producing 600 cars of coal. Miners in the Southern Appalachian field have agreed to work ten hours daily instead of eight, when the car supply is available, so as to increase production.

London—Retail coal dealers here have had no coal to sell for a month. Local industrial plants have worked intermittently and wood has been the household fuel.

Nashville—The State Administration has decided to place the entire output of the state's prison coal mines at Brushy Mountain in the hands of W. E. Myer, state fuel administrator. It is proposed that the mines will make at least partial deliveries under existing industrial contracts.

MONTANA

Bozeman—What is believed to be one of the most important fuel discoveries in Montana in a number of years is a new 9-ft. vein of coal of excellent quality recently discovered by J. A. Black, Charles Stanley and W. DeHoog, of Manhattan, on their coal properties in the Trail Creek section. Thirty men are now working on the ground.

Roundup—The Carbon Mine Co., a Minnesota concern, is to sell the Keene coal mine at Horsethief Creek to a new concern, which is to reopen the property.

Lehigh—Lehigh mine No. 2, lying two miles from the present plant of the Cottonwood Coal Co., has begun producing coal. A new railroad line and new tipples have been completed and a temporary screening plant is being erected. A force of 150 miners is now working.

OREGON

Marshfield—The Henryville mine, leased a year ago by R. M. Jennings, has been turned back to its owner, the Coos Bay Lumber Co., with liabilities against it amounting to nearly $30,000. The mine had just commenced to reap the rewards of heavy investments in mining machinery and development work extending over a period of about a year, and an output of from 50 to 70 tons daily was going forward to marketing points. Since Mr. Jennings leased the mine new drifts and tunnels had been opened and the mine was brought to a high state of efficiency. It is said the Coos Bay Lumber Co. will continue the operations.

H. P. Scheol and William McArthur, of Tenino, Wash., have submitted a proposal to the citizens of Marshfield to establish a coal-briquetting and byproducts plant, with an initial capacity of 160 tons daily, to employ at the start from 50 to 75 men and within a year agree to have a $250,000 industry operating. Their proposal is they shall receive a free site and bonus of $15,000. Marshfield capitalists have obtained the site and are within a few thousand dollars of having the bonus ready. The plant would operate entirely on the slack coal which is wasted at the various mines.

Foreign News

Stellarton, N. S.—An explosion occurred shortly after 5 o'clock in the evening of Jan. 23rd, at the Allan shaft of the Acadia Coal Co.'s collieries, resulting in the death of 91 men. A blast of smoke was seen to come from the mouth of the pit, but no noise was heard. Nine men were brought up alive from the upper levels, but all on the lower workings were killed. The Allan shaft was one of the most productive mines in the Nova Scotia coal fields. The company has had, during the past two years, a great deal of difficulty with the shaft on account of fires caused by spontaneous combustion. Galleries that were on fire have been walled off by reinforced concrete to save the mine. A similar explosion took place in the shaft three years ago, fortunately happening on a Sunday, when there were but few men at work. Some 50 years ago there was an explosion in the same seam of coal, known as the Ford Pit explosion, in which more than 100 lives were lost. The recent catastrophe will reduce the output of coal by 500 tons per day.

Ottawa, Ont. — A meeting of the War Committee of the Canadian government was held Jan. 27 to devise measures for the relief of the coal situation. It was decided to take immediate action to secure increased coal production from the mines of Eastern Canada and to speed up the bunkering of ships in the Eastern ports. Fuel Controller Magrath has gone to Washington to confer with Fuel Controller Garfield of the United States.

Victoria, B. C.—Coal mines in the Crow's Nest Pass are putting out the greatest amount of coal in their history. The rate is now 23,000 tons a day.

Ladysmith, B. C.—A crew of fifteen men is at work at the colliery at Coalmont, taking out coal and getting the property in shape for large operations again. Blake Wilson and R. S. Lennie are the owners of the mine.

Personals

Harry J. Meehan has been appointed managing partner of Cosgrove & Co., of Johnstown, Penn., with which he has been associated as a partner for some time. Starting as a trapperboy at the age of 12 years, and working his own way up through the various stages of the coal mining business, Harry J. Meehan has worked at all phases of coal mining, being a trapper boy, triprider, spragger, digger, assistant foreman, foreman, engineer, general manager,

HARRY J. MEEHAN

superintendent and practically every other position in the business. Mr. Meehan will establish headquarters in Johnstown with offices in the Swank building. He will have supervision over the following plants represented by Cosgrove & Co.: Lenox Coal Co., Barnesboro, Cambria County, Penn.; Thermal Smokeless Coal Co., Portage, Cambria County; Homer City Coal Co., Homer City, Indiana County; Grazier Coal Mining Co., Foustwell, Somerset County, Penn.; Neel Smokeless Coal Co., Blough, Somerset County; Millerton Coal Co., Casselman, Somerset County; Moxham Coal Co., Johnstown, Penn.; Ernest Coal Co., Johnson City, Ill.; Marion & Pittsburg Coal Co., Marion, Ill.; Sootless Coal Co., Pittsburg, Ill. He will also have charge of the management of the Marion & Eastern R.R., in Illinois.

E. B. Sutton, the mining engineer who has charge of rescue work in southern

mines for the Bureau of Mines, has resigned to enter private employment.

Thomas J. Dunbar, formerly Buffalo representative of B. Nicoll & Co., of Pittsburgh, has taken the position of Canadian manager of the lately organized Ontario & Pittsburgh Coal Co., with headquarters in Toronto.

Richard W. Gardiner, of Pittsburgh, Penn., Commissioner of the Pittsburgh Coal Producers Association, with offices in the Farmers Bank Building, at a recent meeting of the operators' association was appointed district representative in the distribution of coal.

Daniel A. Wentz, a Philadelphia coal operator, has been added to the staff of General Goethals. Mr. Wentz has been in Washington since the early days of the war as an assistant to George A. Peabody, chairman of the coal committee of the Council of National Defense. He now has been placed in charge of the fuel and forage division of the quartermaster department. Preston Davis, a New York lawyer, has been named as Mr. Wentz's assistant.

Obituary

William Law, native of Dunmore, and one of the pioneers in the development of the coal-mining industry in Lackawanna County, died recently at the home of his daughter, at Albany, with whom he had been visiting for several days. In 1874 Mr. Law was at the head of the Hillside Coal and Iron Co., leaving this company to form a partnership with J. M. Robertson, of Moosic, and operated several collieries in and around Scranton and Avoca. After disposing of his coal interests he purchased Bruff's Island, in Chesapeake Bay, and later made his home at Chevy Chase, just outside of Washington. He is survived by his widow and three children.

Lieut. Gordon D. Cooke, formerly with the McGraw-Hill Company, Inc., publisher of "Coal Age," died at the base hospital at Fort Bliss on Jan. 10 from pneumonia. Lieutenant Cooke was graduated from the University of Michigan in 1916. As a preliminary training for his work in the Field Service department of the McGraw-Hill Co. he served on the editorial staff of the "Engineering News-Record" for a short period, and later took up quarters at his home city, Detroit, Mich. On Sept. 1, 1917, Lieutenant Cooke entered the service of the United States at the age of twenty-four, with the commission of Second Lieutenant in the Engineer Corps. He was temporarily stationed 75 miles from a railroad in New Mexico doing miiltary mapping for the United States Geological Survey.

Freedom N. Ulrick, who was the Philadelphia sales agent of the Lehigh Coal and Navigation Co., and had been connected with the company since 1907, at which time he became Eastern sales agent with headquarters in Boston, died suddenly on Tuesday afternoon, Jan. 22, from heart failure. After serving the company in Boston for some time, he was brought to Philadelphia as assistant general coal agent. Prior to his service with this company, he was connected with the Philadelphia & Reading Coal and Iron Co., Coxe Brothers & Co. and M. L. Cobb, and sold coal for them in the New England market. Mr. Ulrick was about 47 years of age and had a host of real friends. His funeral took place at his residence in Germantown on Friday, Jan. 25, and was largely attended. He is survived by his widow.

Industrial News

New Baden, Ill.—The coal mine here was reopened Jan. 28. It was closed on account of a cave-in. The mine employs 325 loaders, 20 electrical machine workers and 150 laborers.

New York, N. Y.—All anthracite waiting transport from New Jersey tidewater terminals to New York city will be pooled to avoid delays in shipment. The step was taken by dealers, administrators and others without consulting the Federal fuel administration.

DuQuoin, Ill.—The Scott Brothers coal interests, with offices in the Pierce Building, St Louis, Mo., have acquired a large coal acreage near here, and will soon be ready to begin operations on what is said to be one of the largest strip mines in this part of the state.

Pittsburgh, Penn.—It has been announced that the Republic Iron and Steel Co. has bought the Bessemer Coal and Coke Co. for $3,000,000. The Republic Iron and Steel Co. has plants in the Shenango Valley, as well as a few in this city and quite a number in the South. It will use the Bessemer coal in many of its byproduct plants.

Cincinnati, Ohio—At the annual meeting of the Cincinnati Coal Exchange, held on the evening of Jan. 25 at the Business Men's Club, the election of officers was held, R. A. Colter being chosen as the successor of R. A. Reilly, and both the retiring and the new presidents made appropriate addresses to the members. President Colter also announced standing committees for the year.

Louisville, Ky.—Estimates of Louisville engineers are to the effect that during the five heatless days the city saved 25,000 tons of coal, while, for the rest of the state, the reduction in consumption was 40,000 tons, making an estimated reduction in consumption of coal of 65,000 tons. An estimate had it that 31,000 workmen were idle in Louisville during the five days.

Birmingham, Ala.—At the annual meeting of the Alabama Safety Association recently held, S. L. Morrow, chief engineer of the Woodward Iron Co., was elected president as the successor of James L. Davidson, who had filled the office for several years. John N. Vincent was elected as secretary-treasurer to fill the vacancy caused by the removal of E. B. Sutton to West Virginia.

Middlesboro, Ky.—Four Kentucky coal operators, all charged with selling coal at prices higher than those prescribed by the Fuel Administrator, are under arrest by the United States Marshal and are answerable to the United States Court at Covington or at Pineville, Ky. Other warrants making similar charges are to be served. The four defendants are J. W. Gayle, Mayor of Covington, Ky., and C. C. Lancaster, of the same city, partners, and J. W. and Gillus Nolan, of Harlem, Kentucky.

Clearfield, Penn.—In the License Court here on Jan. 21 applicants in seven little mining towns, namely Houtzdale, Osceola, Madeira, Ginter, Ramey, Smoke Run and Glen Richey, showed that their receipts totaled $336,168.73 during the year, which does not include the receipts of the Madeira brewery. The dry federation is attempting to show that, besides decreasing the output of coal, a considerable amount of coal could be conserved by closing all barrooms until after the war.

Louisville, Ky.—On a warrant sworn to by E. L. McDonald, member of the local fuel committee, R. C. Tway, president of the James Coal Co., Louisville, has been arrested by the United States Marshal. He is on bond to answer to charges that he has persistently refused to make the reports on his business demanded by the Fuel Administration. This arrest followed two days after the arrest of Mr. Tway on the charge of an assault on a customer whom he is alleged to have undertaken to overcharge on a ton of coal for retail delivery.

Cincinnati, Ohio—Plans for the opening of a new coal route by rail from the Kanawha coal district of West Virginia at a rate reduced from $1.55 to $1.15 a ton for coal have been erected for the benefit of Cincinnati coal men, through the action of the Interstate Commerce Commission in approving on one day's notice, instead of the usual 30 days, a special freight tariff filed for that purpose. The new route, which is designed to avoid the congestion existing on the usual route, is by way of the Kanawha & Michigan and the Baltimore & Ohio railroads.

Columbus, Ohio—General Manager Connors, of the Hocking Valley Ry., states that the road will at once get ten additional engines loaned by the Pere Marquette, Ann Arbor and Kanawha and Michigan roads. The Hocking has loaned 1000 coal cars to Eastern lines in carrying out the plans for clearing up the coal blockade. The cars will be returned as soon as additional motive power is available to move all of the loaded cars out of the valley. During the present state of weather, he stated, the engine efficiency was not more than 40 per cent. of normal.

Roundup, Mont.—The Republic Coal Co., operating the big mine at Klein, has brought suit against the treasurer of Musselshell County for a refund of $4429, alleging that the operation of the mine for the year ending June 1, 1917, netted a loss of more than $45,000. The tax was paid under protest. The complaint alleges that the production for that year was 618,000 tons, and that the cost of production, overhead charges and repairs exceeded the value of the coal. The mine supplies the Milwaukee R.R. with its coal and does no commercial business.

Columbus, Ohio—Coal shippers as well as operators in Ohio are very favorably inclined to the zone plan of distribution, which many believe will aid wonderfully in relieving the present stress. It is thought that by that plan the shortest haul can be secured and much railroad work will be eliminated. Under the tentative plans West Virginia and southeastern Ohio mines are to be used in supplying eastern and central Ohio and the State of Michigan. Kentucky mines are to be used in supplying western Ohio and eastern Indiana. A strong campaign will be waged for the adoption of the zone system.

Columbus, Ohio—The Columbus Shippers' Terminal Pool Association, which is now working with a complete force of employees, is showing up efficiently during these days of stress. The pool is handling on the average of about 70 cars daily. Of that amount about half is taken for domestic consumption and the remainder for utilities and steam users. The Columbus Railway, Power and Light Co., the large Columbus utilities, was quite short of fuel for a portion of the past week, but toward the close it had sufficient fuel for some time in the future. For a while street car service was suspended, mostly in the evenings.

New York, N. Y.—The Boston, Cape Cod and New York Canal Co. has temporarily established a reduced rate of toll for steamers carrying miscellaneous freight, and steamers, barges and "boxes" carrying crude material. The reduction of toll charges is equivalent to about 20 per cent. of prevailing rates. To further increase the efficiency of the Cape Cod Canal, this company has requested the New England Coal Barge and Towers' Association to place several tugs at the canal to assist in delivering coal to New England ports. Buzzards Bay could be made the distributing point where barge tows might be broken into several units if necessary, thus avoiding the loss of time now entailed in taking complete tows to Boston for distribution elsewhere.

Jackson, Ky.—The Breathitt Coal Fields Exchange, with capital of $10,000, has been organized and will buy coal from operators and sell in the market, operating under Government price regulations. R. C. Musick, of Jackson, is interested. E. B. Cardwell is manager.

Luzerne, Penn.—The Raub Coal Co. is rushing to completion the erection of its new breaker to replace the structure recently destroyed by fire.

Floodwood, Ohio—The Manhattan Coal Co. is opening a new mine at Floodwood, located on the Hocking Valley R.R., which will have 300 tons and possibly more capacity. It is a shaft mine and the equipment will be modern in every respect. The company controls a fairly large acreage at that place.

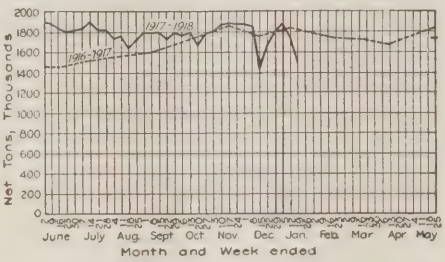
Cincinnati, Ohio—The Hamilton County Fuel Administration on Monday, Jan. 21, issued an order commandeering all coal on tracks in the county, amounting to more than 600 cars, not including those on private industrial sidings. This action was considered necessary in view of the dangerously small amount of coal on hand to supply domestic consumers, essential public utilities and city and county operating and charitable institutions. Relief was so far effected that there was no interruption to the operation of street cars or of light and power plants serving the public, and no actual lack of coal at institutions or among residents, so far as can be discovered. The inadequacy of the fuel supply for manufacturing plants is now the most serious phase of the situation, as the needs of these large consumers have been postponed to the more pressing requirements of the other consumers referred to.

Louisville, Ky.—The Louisville Gas and Electric Co., which pipes natural gas from West Virginia, fails to supply the needs of its consumer customers when the temperature is low. Under the franchise it is penalized by enforced discounts. The total discounts for December and January have now reached 110 per cent., an average of 55 per cent. on each consumer's net bill for each month. The company pleads that unprecedented conditions should absolve it from the letter of the franchise and is now asking that the city permit it to ration gas. Large householders, apartment house owners and others are getting most of the present supply—6 per cent of the consumers, according to the company's statement, burning more than half of all the supply. The city administration is insisting that the company's contract must be enforced. Every residence in Louisville is on the distributing lines of the Louisville company.

MARKET DEPARTMENT

GENERAL REVIEW

Lack of improvement in coal situation largely due to bad weather conditions. The greatest help the coal situation could have would be mild weather.



The coal-conserving holidays and the following heatless Monday have had less effect in relieving the scarcity of coal than was probably anticipated when they were ordered. While the railroad situation shows considerable improvement in some localities, the "Weather Man" has apparently shown great sympathy for the Kaiser. Storm after storm has swept the country until in many regions the snow is now 2 ft. or more deep on the level, with huge drifts in many places. Thus far the winter is generally conceded to be the worst in many years. Of course, the heavy snowfall has its redeeming features as in many localities, particularly in the West and Southwest, it is an indication of abundant crops the following year. But crops do not keep people warm in the winter. From all over the country come reports of the small and inadequate supplies of fuel on hand being doled out in half tons and ton lots to consumers who never quibble over price or quality, their only concern being to secure the coal. In many instances, all over the East in particular, long lines of people are besieging coal offices and yards, carrying away 100-lb. sacks of coal in all types and descriptions of vehicles from a barrel-stave togoggan to a high-powered automobile. Strange as it may seem, this clamor for coal is probably as insistent in Philadelphia, within 150 miles of the coal fields, as it is in any other city. The fact that coal cannot be supplied has furnished ammunition for all manner of criticism and complaints against everyone in any way whatsoever connected with the coal industry, from the meanest trapper-boy in the mines to the President of the United States. In more than one instance, and in more than one city, the police have been called upon to preserve peace and order in the offices of coal retailers. Lately there has come forward a demand from comparatively well-to-do citizens who had laid in their ordinary winter requirements of coal, but owing to the severe weather have consumed this supply months earlier than is normally the case. It now seems difficult for this class of people to understand that they cannot secure all of any commodity that they have the inclination to buy and the money to pay for.

One bright spot in the situation that has developed in the recent past is that bunkering of steamships at Tidewater is now approximately normal. There are not at present, thanks to the partial cleaning up of congestion in Tidewater rail yards, the long delays in bunkering of ocean-going freight and passenger vessels that prevailed two weeks ago. If the transportation of sea-borne freight is essential to the American cause, a long step in this direction has been made.

The atrocious weather conditions, extreme cold and heavy snow have exerted an adverse influence on mining, as well as on transportation. Not only is the placing of empties and the removal of loads at the mines made extremely difficult, but the operation of tipples and breakers is hard to maintain. In many instances in the recent past the loaders underground have had to be moved to the surface to use their shovels in clearing tracks and switches of snow. Another adverse influence of the extreme cold is the shortage of water supply. Many mines depend upon surface streams for boiler and washery water. These have sometimes frozen almost solid to the ground, and in several instances water must be hauled by rail several miles in order to supply the collieries. This method of water supply always unsatisfactory and expensive is doubly so when the thermometer is well below the zero mark. To sum up the whole situation, although under the circumstances considerable progress has been made and every effort is being exerted to relieve the coal shortage, permanent relief will probably only come with milder weather.

COAL PRODUCTION

Another alarming depression nearly equaling in severity that of mid-December affected the bituminous industry during the week ended Jan. 19. The total production of soft coal, including lignite and coal made into coke, is estimated at 8,602,000 net tons. The average per working day was 1,434,000, the lowest reported since the week of Dec. 15, when the daily average fell to 1,406,000 tons. The cause of this profound depression was again an unprecedented storm which paralyzed railway traffic over much of the North and Middle West, during the early days of the week. The production of beehive coke is estimated at 527,000 tons, an average per working day of 88,000 tons, as compared with 84,000 for the week ended Dec. 15. Anthracite shipments dropped from 36,178 to 31,861 cars.

CARLOADS OF COAL AND COKE ORIGINATING ON PRINCIPAL COAL-CARRYING ROADS WEEK ENDED:

	Dec. 29	Jan. 5	Jan. 12	Jan. 19
Bituminous shipments, 121 roads.	158,596	168,936	180,411*	151,567†
Anthracite shipments, 9 roads....	29,476	25,604	36,178*	31,861†
Beehive coke shipments, 4 roads....	10,211	9,348	11,560*	10,826†

* Revised from last report. † Subject to revision.

BUSINESS OPINIONS

The Iron Age.—With so large a part of their product, particularly in heavy lines, going to the Government or its Allies, or to plants having Government contracts, the iron and steel industries, felt less than others the closing down order of the Fuel Administration. Fresh snows and intense cold combined to aggravate the freight blockades, as the order went into effect, and made more difficult any measure of its effects.

Bradstreets.—"Business as usual" was abandoned as a trade slogan in the territory east of the Mississippi river this week, thanks to the Fuel Administrator's order closing industrial plants for a period of five days and business in general for one day. The repression thus developed strikingly contrasts with relatively smart activity in that part of the country west of the river just named. However, the industries of the country are all backlogged with heavy orders, principally for governmental account, and while the stoppage of work brought about by the Government decree plus the baneful effects of inclement weather, crimped production and restricted trading over a wide area, some slight improvement in the fuel situation has resulted.

Dry Goods Economist.—The important developments for the retailer are the probable effects of the temporary cessation of output through the manufacturers' general adherence to the Fuel Administrator's order. Of course, there are many merchants who are concerned over that feature of the order which closes all stores east of the Mississippi River on each Monday for a period of ten weeks. At this writing it is too early to attempt to gage fully the extent of the curtailment, but some of its results are apparent in the higher prices made this week on cotton, wool and silk fabrics.

The American Wool and Cotton Reporter.—Last week was a quiet one in the local wool market. The enforced closing of the mills by order of the Fuel Commissioner was merely one more adverse factor in the already uncertain situation.

Marshall Field & Co.—The current wholesale distribution of dry goods for the week equals the heavy volume of the corresponding period a year ago. The volume of road sales for both immediate and future delivery is considerably larger than in the same week of 1917. Customers have been in the market in greater numbers. The market on domestic cotton continues strong. Collections are normal.

Atlantic Seaboard

BOSTON

Receipts extremely small, and outlook bad. Government priorities at loading ports take the coal and other needs wait. Under order of Jan. 17 fuel authorities refuse emergency supplies for any but vital needs. "Storrow coal" comes forward both all-rail and by water, but shipments hampered. Anthracite shipments recover slightly from paralysis of last month, but deliveries are small and irregular.

Bituminous—The prospect for fuel is so disheartening that already the owners of large factories are preparing to save their property from injury by reserving enough fuel for bare heating purposes. The state fuel administrators are warning all manufacturers, whether working 100% on Government orders or not, unless specially exempt by order from Washington that emergency coal cannot be supplied except to the "current necessary requirements" of consumers on the preferred list beginning with railroads and domestic consumers. The rule is most drastic, but in no other way can the utterly inadequate supplies now coming forward reach the really vital needs and save the people from undue privation. Utilities like the Cambridge, Mass., and Hartford, Conn., electric light plants are running on a hand-to-mouth basis and the railroads are on narrower fuel margins than the public realizes.

Inland cities like Worcester, Mass., normally depending almost exclusively upon all-rail deliveries are now feeling the pinch. Coal is being taken from school-houses and city buildings to provide for hospitals and for the wants of people who buy in small lots. Retail dealers who have had a prosperous business now confess their inability to get coal and the number of those who look to the fuel administration for relief is increasing by leaps and bounds.

The Panama R.R. transport "Achilles" has now made her third trip to Boston from Hampton Roads, but as yet there is no certainty she will continue in the service. Each trip has brought upwards of 12,000 tons of bituminous which has been distributed as prudently as the fuel authorities could manage and it has helped in many serious cases from Maine to the Connecticut line, but the situation is even more acute now than when the cargoes were received. From the second and third cargoes of this ship as well as from other vessels with emergency coal consigned to J. J. Storrow, fuel administrator for New England, not a single car was sent to any industrial plant, excepting one or two instances where Washington had granted special exemption.

Manufacturers who are being pressed by the War Department to show delivery of goods ordered find it difficult to understand why they cannot be included on the preferred list. Colleges and other educational institutions are anxious to be classified as "domestic consumers," but the order of Jan. 17 is being interpreted strictly and the coal will hardly be forthcoming. As it is, it takes constant vigilance to keep the railroads, hospitals, and other preferred needs supplied for more than a few days at a time.

The list of mines directed to load assigned cars on the "New England order" of Jan. 3 was further modified on Jan. 22. Several mines that were shipping up to capacity on other priorities were taken off the list and others substituted. Most of the substitutions are of relatively small operations, although this time each mine substituted is required to load only from one to three cars per day, as the case may be, and this arrangement it is hoped will furnish a larger percentage on the 500-car quota than heretofore. Of the cars that have been shipped for the fuel administration considerably more than half have been required by the New England railroads.

Congestion at Maybrook, N. Y., one of the principal gateways for New England, got so bad last week that an embargo was placed. Coal usually routed via that point is now being sent to New York ports for dumping into boats in the hope this will hasten delivery to the points in distress. Coal on the New England priority that emanates on the B. & O. will also be forwarded via tide-water, for the same reason.

Loading at New York has been extremely slow for anything but coal for Government uses. At one port a barge has now come to the top of the list for five times for loading, only to find each time that the coal has been taken on priorities. Appeals are constantly being made to the fuel administrations to protect boats from such delays.

At Hampton Roads there exists what might be called a "decidedly decreased improvement." More than 100 bottoms are waiting while more than 25 ships for Government purposes have cleared. The extreme slowness with which the Hampton Roads situation has been handled calls for radical treatment, and there is a prospect that something drastic will be done.

Meanwhile, the discussion of a zone system of distribution is interesting the trade. Just how New England will fare in the allotment is not disclosed, but certainly there sems no possible change that would not make for improvement. Operations ordinarily loading for this territory are swamped, many of them, with priorities of one kind or another, and together with the heavy supplies demanded for engine fuel there is no coal left for ordinary commercial contracts. The percentage now coming forward on contract is extremely small, either by water or rail.

In Boston practically all bituminous coming to retail dealers is being pooled for distribution under the direction of a committee which has control over all deliveries of more than a ton each. This has been found necessary in order to assure necessary institutions sufficient fuel to keep them running. The bunkering of ships is a problem of increasing difficulty in view of the light receipts of commercial coal.

Anthracite—The ice embargo lifted last week enough to let a few barges out of the Delaware, but loading is even slower than before, and it is increasingly difficult for cargoes to run the gauntlet of New York retailers. Domestic sizes are again ill-assorted and several cargoes are coming forward with broken and egg when the market requires nothing so much as stove and chestnut. To this extent receipts may be said to have "improved," although receipts of water-borne coal especially are light and more than intermittent.

All-rail shipments are slowing up, partly because of congestion at the transfer points, but chiefly through interruptions in mining because of the weather. "Solid trainloads" are therefore in the discard for the present.

Boston retail prices have been advanced 40c. on domestic sizes by authorization of the local fuel committee, making the present figure $10.25 per ton of 2000 lb. sidewalk delivery. There are several dealers today without a ton of anthracite in their yards.

NEW YORK

Not much improvement noticeable in situation. Receipts do not increase and storms balk efforts of officials. Pooling of anthracite expected to help. Bituminous operators complain of lack of cars and of men leaving for other industries. Bunkering nearly normal.

Anthracite—Whatever improvement may have been expected in the situation here was dispelled by a storm of snow and sleet and a considerable drop in temperature the first part of the week. Fuel administrators and tradesmen were hopeful that within a few days with a continuance of favorable weather conditions the fuel situation so far as the Metropolitan district was concerned, would show much improvement. Larger receipts of fuel were reported at the Tidewater docks and with the ice clearing out of the river and bay it would have been an easy matter to deliver the coal to the retail dealers yards, and the prospects for accomplishing it were encouraging.

While no decision has been received from Washington regarding the pooling of anthracite, as advised by State Fuel Administrator Wiggin in a telegram to Dr. Garfield last week, the shippers to several of the coal loading docks have gone ahead on their own initiative and are pooling their own coals according to sizes. On Monday of this week shippers of coal to Perth Amboy met and decided to pool their coals. The shippers to some other docks had previously decided to do the same thing and it is expected that within the next week the shippers to other docks will make the same decision.

The pooling of coal was also advocated by the railroad officials and coal operators at a meeting held late last week at the conclusion of which President Loomis of the Lehigh Valley issued a statement which said that in order to reduce the accumulation of cars on hand each day at the docks and avoid a large amount of switching it was agreed subject to the approval of the Administration, to pool all anthracite coal at New York tidewater ports.

Mr. Wiggin in his telegram to Dr. Garfield suggested that the pooling be done by the reduction of sizes from 8 to 4.

A modification of the new demurrage order has resulted in shipments coming forward in good volume, it having been feared that a continuance of the order which reduced the free time for cars would cause producers to send their coal elsewhere.

An important development during the week was the sending to this city by Dr. Garfield of James B. Neale and Arthur Leroyd, his two assistants who are thoroughly acquainted with the anthracite situation. Several conferences were held with the Fuel Administrators and others and then Mr. Neale and Mr. Leroyd returned to Washington to lay their recommendations before Dr. Garfield. So far no word has been received from Washington as to the outcome of the conferences.

The selection of J. D. A. Morrow, general secretary of the National Coal Association to take charge of the distribution of coal meets with the approval of the local trade, many members of which know Mr. Morrow personally. A few weeks ago he addressed the members of the Wholesale Coal Trade Association in this city.

The second coalless and heatless Monday in compliance with Dr. Garfield's order resulted in more places being closed than on the previous Monday, and it is expected that the saving of coal will be larger. Inspectors were scattered throughout the city to see that the order was lived up to. Very few violations were reported.

Many complaints are heard of higher prices charged by the cellar peddlers than those fixed by the Fuel Administration. There is still much suffering among the poorer class because of their failure to get coal as needed.

The mayor's committee of women on national defense has started an educational campaign on the scientific methods of building fires, and will also report all complaints of over-charging and hoarding by coal dealers to the authorities.

In view of the present conditions and the none too bright prospects for next summer and winter, people living in the rural sections and small communities of the state have been advised to cut and store all available wood.

It was learned early this week that on Friday, Jan. 25, a meeting of anthracite operators was held here, at which a comittee of three was appointed to arrange plans for the proper distribution of anthracite coal during this year. This committee consists of President Richards, of the Philadelphia & Reading Coal and Iron Co.; Samuel Warriner, president of the Lehigh Coal and Navigation Co., and Joseph Dickson, of Dickson & Eddy.

It is said that the distribution will be based upon average tonnages consumed in the year 1916 or 1917, allowing increases where the population is greater.

The pooling of anthracite is expected to be general within the next few days. A meeting of shippers on the Philadelphia & Reading was held at Philadelphia on Tuesday of this week, at which the matter of pooling coal was discussed.

Production is better than for several days past. Heavy storms impeded railroad transportation but coal moved quickly and without much delay. Many of the collieries are now working to full capacity and production is heavy. Warnings have been issued regarding possible floods as soon as the weather moderates because of the heavy snow now covering the mountain sides.

Local middlehouses and shippers are being urged to send coal to New England and into Canada, dealers from the Dominion claiming the shortage to be severe.

Locally there is not much change in the situation. Some dealers fail to see any betterment while others see a slight improvement. There is no coal in many of the retail yards, while the surplus in the consumers' bins continues to become smaller owing to the unusually hard winter. The situation on Long Island and in Brooklyn is particularly alarming. Receipts to these points have not been as large as within the past few weeks, although shipments through the Pennsylvania tubes has been resumed.

Many barges loaded with coal continue to get sunk because of the heavy ice floes. With the exception of a narrow channel the Hudson River is said to be frozen entirely across north of the New York City line.

Urgent call for coal comes from several of the smaller towns in New Jersey but adjacent to Newark and Jersey City, no coal having been delivered in some of them for the past week or ten days.

While there is no surplus of buckwheat and the two smaller sizes there is no absolute scarcity and dealers are able to keep enough coal in the bins to keep the fires going.

Current quotations, per gross ton, f.o.b., Tidewater, at the lower ports are as follows:

	Circular	Individual
Broken	$6.30	$7.05
Egg	6.20	6.95
Stove	6.45	7.20
Chestnut	6.55	7.30
Pea	5.05	5.80
Buck	4.30@5.00	5.50@6.00
Rice	3.75@3.95	4.50@5.00
Barley	3.25@3.50	4.00@4.25
Boiler	3.50@3.75	

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—The one bright spot in the bituminous situation is the reduction in the number of ships waiting in this harbor for fuel before taking on cargoes. Special efforts have been made to secure fuel for the vessels which a few weeks ago exceeded 150, and which was given as one of the reasons for the issuance by Dr. Garfield of his drastic order.

There is not much change in the supply of free coal. Contract coal is not moving as freely as is desired and complaints of slow deliveries are numerous.

Some mines were idle for ten days at a stretch this month because of the lack of cars while on other days the average time of employment has been less than 3 hr. daily. This has resulted in much uneasiness among the workers and there have been many deflections to other industries.

The railroads continue to confiscate whatever coal they desire and when they have taken all they want and the other priorities have been satisfied there is very little left for the producer to send to his regular trade. However there is little complaint heard because of this.

The Wholesale Coal Trade Association has forwarded to Dr. Garfield a resolution asking that after the present accumulation of ships in the harbor has been supplied with bunker coal by the United States Shipping Board and the Fuel Administration, the coal bunkering companies be allowed to have their business back.

The embargo on all shipments except fuel, food and a few war necessities over the Pennsylvania lines east of Pittsburgh, the Baltimore & Ohio and the Philadelphia & Reading roads helped to move coal to tidewater considerably.

No definite announcement has yet been made concerning the renewal of contracts some of which will soon expire, but whatever is done will be subject to examination by the Fuel Administration in Washington.

Strenuous efforts were necessary this week to get coal to the factories lining the Brooklyn water front, as well as Newtown Creek and the Gowanus canal. Heavy tugs were used for breaking the ice and it was proposed to appeal to the Federal authorities for permission to use army and navy vessels for the work.

Reports indicate that the New England situation continues serious. Many urgent calls are received by local dealers for supplies.

PHILADELPHIA

Anthracite situation at its worst. Snow and cold interfere badly. Thousands of homes without coal. Mild weather only hope of relief. Weather conditions more serious at mines. Bituminous coal seized for domestic use. Suspension order helps freight movement. Bituminous famine continues, with situation critical. Heavy arrivals of bunker coal. Operators demand change in Lever law.

Anthracite—With the arrival of the snow storm early in the week the climax in the anthracite shortage seems to have been reached. Notwithstanding all the earnest efforts of the state and city fuel authorities conditions have grown steadily worse until thousands of homes are without coal and steady streams of unfortunate people besiege the coal yards. In many cases when a dealer receives a car of coal the entire contents are sold in small quantities directly to the consumers, who carry it away in buckets and baskets, in addition to express wagons, sleds and even baby carriages.

Late in the week the chairman of the city fuel committee admitted that the suffering is becoming greater and more acute, and that he sees no way out of the difficulty.

except a spell of mild weather. Goaded on by the newspapers many people vent criticism upon every person in any way connected with the coal business. Dealers state that they are threatened almost daily and have at times been compelled to summon the police to clear their office of angry would-be customers. Even Chairman Lewis of the fuel committee has not been immune and it is not unsual for irate citizens to be ordered from the office. The two principal reasons for the inadequacy of the supply—war and weather—seem to be completely ignored.

On account of the continued severe weather those people who were fortunate enough to fill their bins in the spring are now becoming in need of fuel and insisting on having it. In many cases these people are unable to understand why they cannot have what they have the money to pay for. If it was not for the seriousness of the situation the influence which this class of people seek to bring to bear in order to procure a ton of coal would really be amusing. We even know of retail coal men who have less than a quarter-ton in their own cellars.

Early in the week the State Fuel Administrator again appealed to Dr. Garfield for reconsignment to Philadelphia of coal that could not go forward promptly to New York and New England owing to car congestion and explained that unless some action were taken there would be suffering here to an incredible degree. It is not believed, however, that any such request will be granted. The newspapers continue to print in large type that coal is being diverted in transit from here, but overshadowing all other troubles word comes of a water famine in the mining region which has tied up a number of the largest operations in the Schuylkill region. The frigid weather has frozen the mountain streams almost solid and in some instances water is now being hauled for boiler use at the mines. In addition snow is an almost daily occurrence, with at least two feet on the level for the past three weeks. In order to keep the sidings clear about the mines the mine workers are called upon sometimes for the greater part of the week to shovel snow.

The most important action taken by the fuel committee to relieve the domestic situation was the commandeering of 50 cars of bituminous coal which have been distributed to a number of retail yards. While this is a strange fuel to the consumers here there is not the least doubt that it will be eagerly taken by all who are fortunate enough to get it. The committee has arranged to distribute at least 5000 tons of this coal, of which the above 50 cars was the initial shipment.

While there is little complaint from the consumers, the retail prices appear to have an upward trend, while the quality certainly does not improve. In West Philadelphia especially the average price for stove and nut is close to $10. Most of the dealers in this section of the city are paying the individual operators premiums of 75c. a ton. As to quality the big companies seem to be furnishing the better prepared coal, while some of the smaller operators have apparently neglected all caution in their desire to get out tonnage.

In the steam trade all grades continue to be sold up and some of the larger shippers are getting behind on their barley orders. This is on account of much of this coal coming from washeries and stock piles, which are difficult of operation in the present wintry weather. The sales of culm, principally by the individuals, continue to show good increases.

The prices per gross ton f.o.b. cars at mines for line shipment and f.o.b. Port Richmond for tide are as follows:

	Line	Tide		Line	Tide
Broken	$5.90	$6.05	Buck	$3.15	$3.75
Egg	4.80	6.00	Rice	2.65	3.65
Stove	5.05	6.35	Boiler	2.45	3.55
Nut	5.15	6.40	Barley	2.15	2.40
Pea	3.75	4.65			

Bituminous—There is no abatement in the soft coal famine. Despite much bitter criticism to the contrary it cannot be denied that the suspension order has at least done some good in providing coal for some vital needs. This began to show itself on the first Monday holiday when the railroads brought into the city 1100 cars of bunker coal, all of which was promptly delivered to the waiting ships, and good quantities have been received daily for the same purpose.

It has been a most active week for the operators, with a continuous succession of meetings. Anticipating the zoning order of the national administration the local shippers got together and in conference with Administrator Garfield appointed a committee of four from their number to be in touch with the state fuel authorities at all times. This committee has taken office room near Chairman Potter and some one of the committee will be on hand at all hours. If there is any criticism of the zoning system it is only on the score of consumers being accustomed to certain grades of coal, which must of necessity be eliminated under the present plan.

The operators of the central Pennsylvania district with offices in this city have passed a resolution asking the U. S. Senate to amend the Lever food law insofar as it relates to the production and distribution of coal. In this resolution they ask that the present national fuel administration be superseded by a committee of 15 men, to consist of 9 coal men, two from the railroads, two from the Government and two citizens. The resolution has already been forwarded to Senator Knox of this state, asking that he introduce a bill covering this point.

The need of fuel has become so critical that the matter of a new price seems almost to have been overlooked, but notwithstanding this the producers have no doubt that eventually they will be granted relief in this respect. They point to the anthracite trade, where from the beginning a satisfactory price has been allowed the operators and as a result production has been greatly stimulated.

While many consumers seek to secure contract protection, even to making propositions which are simply out of the question, there is practically no activity in this line, except possibly in the case of certain public utiliites, a few of which occasionally state they are being protected on fair quantities at the Government price. These instances, however, are usually where former contracts have expired and simply resolve themselves into the question of the old shippers continuing a supply to the best of their ability.

A careful review of the entire situation must bring one to the conclusion that the fuel needs of this district are still in a critical state and at this time it would appear that further suspensions are but a short time off. While there continues to be much harsh criticism of the national fuel administration there is a growing tendency to consider the difficulties which daily arise to hamper each new move.

BALTIMORE

Blizzard-like conditions here have tied up traffic. Thousands of homes without coal, and many industries run on shortened time. Hard coal prices advanced.

Bituminous—This section, blizzard swept at a time when it was hoped that fuel movement was to improve, has been caught desperately short of coal of all character. Hundreds of industries, large and small, are running on a day-to-day supply, and many have been forced to curtail production.

On best days recently the unloadings for strictly local consumption have run only about an average of 50 cars of soft coal a day, whereas the normal consumption, when normal winter stocks are on hand, is around 125 cars a day. The snowstorm cut the unloadings here at the outset of the week to less than 25 cars a day. Mining districts report the arrival of empties as being far below their capacity to load. Serious congestion is reported at all coal junction points. Several hundred cars of soft coal have been diverted the past week at Hagerstown and Brunswick by the American Railway Association Special Committee of National Defense, from commercial consignment to the account of Fuel Administrator here for domestic and public utilities use. Many of these diverted cars have failed to get through to terminals here, however.

Anthracite—The situation here is so desperate that hundreds of householders have turned to the use of bituminous, where that coal could be secured. The hard coal unloadings here are reported around 10 to 25 cars a day, whereas the normal receipts in normal winter times is around 100 cars a day. The straits of the consuming public here are shown in a report of a census made by the lighting company through meter inspectors. This shows in $^{19}/_{25}$ths of the city blocked off that there were up to January 22 a total of 9685 homes without coal of any kind. This was a 50 per cent. increase over December figures, and it is estimated that there are now fully 15,000 families in Baltimore without coal in their cellars.

Stating that the reclassifying by Washington as independents some of the important mining supply concerns that formerly sold on low price schedule required a rearrangement of hard coal prices at retail here, Fuel Administrator Meyer has announced the following new schedule of rates, which are a 75 cent advance over the old prices allowed the trade:

Hard White Ash—No. 1, broken, $10.40; No. 2, egg, $10.10; No. 3, stove, $10.35; No. 4, chestnut, $10.50; pea coal, $8.85; buckwheat, $8.10.

Sunbury—No. 2, egg, $10.35; No. 3, stove, $10.60; No. 4, chestnut, $10.75.

Lykens Valley—No. 2, egg, $10.85; No. 3, stove, $11.10; No. 4, chestnut, $11.10.

Lake Markets

PITTSBURGH

Situation somewhat improved. Better weather the chief reliance. Monongahela River frozen, but probably will be opened.

The local fuel situation has improved materially in the past week. The plant-closing order helped some, by reducing the consumption of coal, while the railroads have operated somewhat better, especially in the past two or three days. A 17-ft. crest of water is coming down the Monongahela River and steamboats will embrace the opportunity to break ice in the lower pools, with prospects they can open the first three pools. As soon as the crest is past, coal will follow, and by the end of the week a good supply of river coal is expected for Pittsburgh, enabling several plants that have been idle over three weeks to resume.

Coal shipers attach much more importance to the weather as a factor in coal supply than to the artificial means being used to combat the elements. It is believed that with anything like moderate weather the railroads will be able to operate and plenty of coal will be shipped. Car supplies at the mines late last week and at the beginning of this week were the best for two or three weeks, but that is saying little. Unless there is a fresh cold snap, however, the empties are expected to get through in larger numbers day by day.

Pittsburgh is not among the six of the 20 coal districts for which at this writing district representatives of the Fuel Administration have been appointed. Under the zoning system cross hauls are to be eliminated and coal is to be moved by the most direct routes from point of production to point of consumption. Byproduct coal, it is understood will be excluded from the system. Locally it is regarded as high time that the system should be put into operation, not only for what it is aimed to accomplish, but by reason of some practices that have grown up that will presumably be eliminated. It is claimed that under the old system some diversions of coal have been ordered that were not entirely warranted under the circumstances, the need of coal by the consumer in whose interest the diversion was ordered being clear, but the need of the original owner being perhaps equally pressing, although by chance not emphasized to the authorities.

A great deal of coal is changing hands at the set prices, by reason of requests of the authorities, but of coal purchases in the open market, without any influence being exerted by the authorities, there have been very few. The market remains quotable at the set prices: Slack, $2.20; mine-run, $2.45; screened, $2.70, per net ton at mine, Pittsburgh district, with 15c. permissible to be added in the case of sales by brokers.

TORONTO

Transportation conditions improved. Shipments of coal coming forward freely. Dealers delivering only small lots. Some suffering in suburban localities.

Conditions as regards the supply of coal show improvement, as notwithstanding unfavorable weather, shipments have been coming in with comparatively little delay. Local deliveries continue to vary from day to day, dealers being overwhelmed with orders and generally limiting deliveries to small lots. Centrally located consumers have little difficulty in obtaining supplies for immediate requirements, but numerous cases of hardship in the outlying districts, where the streets are in bad condition, are reported. There is no change in prices.

Quotations for best grades per short ton are as follows: Retail anthracite: Egg, stove, nut and grate, $9.85; pea, $8.85; bituminous steam, $9; slack, $8 to $8.50; domestic lump, $10; cannel, $9. Wholesale, f.o.b. cars at destination, three-quarter lump, $7 to $7.50; slack, $6.85 to $7.

BUFFALO

Slight improvement in bituminous. Cars badly bunched by priority orders. Permanent relief not before warm weather. Few plants shut down as yet, many near closing. Arthracite in better supply, but consumption much increased.

Bituminous—The situation is a trifle improved and there is promise of a better supply of coal hereafter, but it is by no means a certainty for the priority orders, which sent more coal to certain points than could be handled has made that side of the situation about as bad as possible. Shippers now say that there is coal enough

mined to meet the requirements, but the car supply has been wasted and it will be some time before that can be straightened out.

Complaint of the management of bituminous continues. Shippers say that the new zone system of handling will work, for coal men are to head it, but the cars have been so tied up that it will take some time to get them to moving as they should. Reports of cars bunched at various points with no motive power in sight are common. Jobbers say the zone system will put them out of business.

The fire insurance agents have begun to take alarm at the prospect or possibility of loss from plants shutting down and are threatening cancelations.

Government prices of bituminous are not common, but they are becoming more so steadily and will be the regular prices soon. There are at the same time reports of coal sold at extra prices here and there. Quotations, per net ton, f.o.b. Buffalo are as follows:

	Slack	Lump
Pittsburgh	$3.75	$4.25
Bessemer	3.70	4.20
Allegheny Valley	3.60	4.10

Anthracite—The local supply has increased considerably of late, but if it had not the distress would have been great. As it is the distribution cannot be made to meet the needs exactly. Hundreds of emergency cases sometimes develop in a day, which have to be met by investigation and the giving out of coal by the single ton to save it from too early exhaustion. Some of the retailers are said to disfavor one-ton business and try to make it appear that they are too busy to bother with it.

Anthracite shipers agree that there will be no real relief till spring and they do not look for it to take place then, though the suffering for want of fuel ought to disappear soon thereafter. It is the weather that makes it so hard to keep the consumers supplied and the trade has to reflect that ordinarily all of our coldest weather usually comes after this time of the year.

The snow is deep especially on side streets and the deliveries of single tons have to be made in a deep bank, to be dug out and carried to the cellar by a slow and laborious process.

DETROIT

Coal scarcity daily becomes more acute. Scores of factories in Detroit and throughout state close; tie-up of others threatens.

Bituminous—New transportation tangles produced by the snowstorm and low temperatures of Jan 26-7 dropped another monkey wrench into the mechanism of the fuel administration's system of coal supply for Detroit, which had been seriously disarranged previously by heavy snowfall and zero weather in the three weeks preceding. Throughout the city and state, hundreds of manufacturing plants are being forced to close through lack of coal, while scores of others are facing the necessity of following that course. Among the latter is the gigantic Morgan & Wright plant of the United States Rubber company in Detroit, which is working on Government contracts.

Closing of the public schools of Detroit to permit distribution of their coal supply among suffering domestic consumers is being urged but is temporarily deferred. More than 3000 applications from domestic coal users are on file in the Detroit police department, which is administering the local distribution, in connection with the Detroit Terminal pool organized by shippers and jobbers.

Anthracite—Reports given by railroad committees indicate Detroit received something like 25 cars of anthracite during the week ending Jan. 26. Few of the retail yards have any in stock and the continued transportation troubles due to weather conditions render arrival of additional supplies uncertain. Little or no coke is to be had. Many domestic consumers having heating plants designed to use only hard coal, are struggling to use soft coal, when they can get it. With the two months usually productive of the severest winter weather yet to come, the outlook is causing great apprehension among coal dealers as well as consumers.

COLUMBUS

There is still a marked shortage of fuel in central Ohio and strenuous efforts are being made to avert suffering. Domestic consumers are now being served first. The county and state fuel administrations have been busy confiscating coal for domestic use.

The coal situation in Columbus and central Ohio territory during the past week has been the worst in several months. Owing to zero weather which stopped railroad traffic to a large extent receipts of coal were kept at a minimum and fuel administrations have been having their hands full in distributing the available supply. Domestic users have been given the preference and what was left over was permitted to be used by public utilities and commercial consumers. On the whole the situation has been extremely bad although instances of actual suffering were kept at a minimum.

Steam users have been hard hit during the past week. Owing to restrictions of the fuel administration, many plants have been compelled to suspend operations entirely. The public service concerns have been giving only partial service because of short fuel supplies. Hospitals and charitable institutions have been provided for and the same is true of public buildings. But schools have been short and suspensions have been made necessary in many sections of the state.

Prices on short tons f.o.b. mines are as follows:

	Hocking	Pomeroy	Eastern Ohio
Sized grades	$2.70	$3.05	$2.70
Mine-run	2.45	2.70	2.45
Screenings	2.20	2.45	2.20

CINCINNATI

Moderating weather promises relief from the serious fuel situation, but so far it remains necessary to stint industrial consumers in order to supply domestic demand. Transportation conditions are still bad, congestion being unrelieved.

Although it is estimated that 10,000 tons of coal were saved on the first Monday "holiday," and probably four times that much by the five-day suspension of industrial operations, in and around Cincinnati, relief from the fuel famine which made widespread suffering imminent was not immediate, and has not yet been safely accomplished. While it was not expected that complete relief from the general congestion on railroad lines would result immediately from the suspension order, it was believed that the beneficial effects would be far greater and the improvement in both transportation conditions and in the fuel situation much more tangible than was the case.

As a matter of fact, while there has been some improvement, brought about by the concentration of all thought on the movement of coal, continued severe weather would have rendered this almost negligible. Much more moderate weather beginning on Wednesday of last week served to furnish the needed remedy, by reducing the emergency demand for coal, and by making it possible to expedite general freight movements, which had been badly hampered by heavy snow and by low temperatures.

LOUISVILLE

Moderating weather most hopeful influence in Kentucky coal market. Traffic failure ties up much coal on Kentucky tracks. Production less than 50 per cent. Retail market chaotic.

Several days of moderating temperature have brought much encouragement to the Kentucky coal trade, holding as they do promise of easing up of the traffic situation and, with an improved supply of gas, a let-up in the panicky demand of retail consumers. There are 3000 or more cars of coal between the mines in southeastern Kentucky and the Ohio river gateways some of which have been on track for two weeks or more.

Unable to move this coal the railroads have been unable to place empties and numbers of night crews have been laid off as much as three days at a time by the railroads. A 30 per cent. car supply was the week's record, while one operator's estimate of total production was that it would not equal 50 per cent. of normal. Some of the mine operators have had to contend with plant breakdowns at the mines, while derailments and wrecks of coal trains have from time to time further slowed things up. In many parts of the state operators have had to take their miners to the surface and set them to shoveling snow off roofs to prevent collapses and to clearing the yards and terminals.

The retail trade throughout Kentucky is still in a chaotic state. Consumers hang on the telephone and dealers must have extra clerks to answer them, while all have many orders on their books with local fuel administration assignments to deliver coal piled up on top of them. Here and there the situation has been further disorganized by the well-meant though mischievous efforts of amateur coal traffic regulators to find solutions. Meanwhile the coal trade is pegging away, patiently where possible, overtime in most cases, doing what it can to keep production and distribution alive.

BIRMINGHAM

Local situation much improved by warmer weather and more liberal receipts. Production also bettered by more favorable weather conditions, though there is still an acute shortage in both domestic and steam grades.

The stress in the domestic situation locally and throughout the state has been greatly relieved by several days of warmer weather, and increased shipments, and although there is still an acute shortage, all urgent appeals have been met, and in a few instances local yards have been able to get a car or two ahead. Considerable tonnage was commandeered at different points in the state for both domestic and steam use, but only about 20 cars were taken over by the local fuel board. The distribution of coal donated by operators continued this week and the poorer classes were afforded relief in this manner. The steam situation remains unchanged—the demand being far in excess of the available supply, essential industries and utility companies receiving some benefit from the closing down of non-essential operations for the five-day period.

Good results are expected to be attained in the distribution of Government requirements and federal priority orders among the mines under the direction of E. A. Holmes, district representative of the fuel administration, recently named for the Alabama field, as it will undoubtedly avoid much confusion and disturbance in the normal movement of coal from the mines of the district.

The proposed zoning of the distribution territory of each field is also looked upon with favor by operators provided boundaries are established in line with the territory normally supplied from this district.

Coke

CONNELLSVILLE

Cross movements largely eliminated. Car supplies beginning to improve. Blast furnace operations very light.

Cross movements of coke are being rapidly eliminated, practically all interests being now willing to make what exchanges the conditions dictate. The exchanges now in operation involve a few tens of thousands of tons a week. Practically all the coke that reaches the main line of the Pennsylvania through Latrobe and Greensburg is now going east.

Car supplies in the coke region improved slightly late last week and expectations are that this week's supplies will be much better. There has been practically no improvement in supplies to blast furnaces, as the furnaces in the past few days have been feeling the effects of the light shipments previously made. There is nothing like quick movement as yet, and any increase in shipments this week would scarcely be felt by the furnaces even next week. While the amount of coke en route between ovens and furnaces has materially decreased in the past two or three weeks, shippers attribute the decrease more to the lightness of shipments than to the railroads being in better working order.

The plant-closing order has not directly affected blast furnace operations, as the blast furnaces are exempted on the ground of their representing seven-day work. Blast furnace activity in the Central West is now averaging between 60 and 70 per cent. of capacity.

There is no open market for coke as the limited shipments are all taken up by contract requirements. The market is nominally quotable at the set prices: Furnace coke, $6; 72-hr. selected foundry, $7; crushed, over 1-in., $7.30, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 29 at 238,425 tons, an increase of 718 tons, and shipments at 247,487 tons, a decrease of 43,231 tons.

Buffalo—The situation continues quiet, with operations not badly hampered by the general fuel situation. Coke is by no means easy to get, but the supply has not been reduced as in the case of bituminous coal, for both production and consumption are in few hands and the relations are easily made. It is believed that the supply will continue at least fairly good and that as much iron will be turned out in future as is the case with other necessary manufactures. No popular price for commercial coke has been adopted, at least if the Government regulation prices have prevailed anywhere the fact has not been made public. A good many of the manufacturers of byproduct

coke are selling the smallest size, called breeze, at about $2.75 net at the ovens. It is eagerly taken by all sorts of consumers of fuel. Much more of it could be sold if it were to be had.

Middle Western

GENERAL REVIEW

Continued zero weather throughout the Middle West puts railroads almost out of commission. Coal production limited.

Continued cold weather has almost put the railroads out of commission, resulting in their supplying the coal mines throughout this section with 25 to 40 per cent. enough equipment to load their potential capacity.

Franklin County, the largest producing county in the State of Illinois, produced 180,000 tons less from Jan. 2 to 22 inclusive, than for the same period in 1917.

In Saline County output was reduced from 160,000 tons in 1917, to 34,000 tons for the same period in 1918.

Williamson County, the second county in the state in production, has had less than 40 per cent. car supply.

In various sections of the state mine operation is seriously handicapped for the need of water, and the mines are compelled to depend on the crippled railroads to switch water cars from some near-by supply to the mines. In many instances this service has been so delayed that the mine was either compelled to close or wait indefinitely on delayed switch engines to perform the service.

Dr. Garfield's closing order has been strictly observed throughout this territory, but not without some complaints. These complaints usually arose in those cases where the persons or firms affected had made provision for their fuel supply, and could have continued operation with what they had on hand.

The past week has as yet had no equal as far as demand is concerned. In every section of the country the cry for coal by the dealers and steam users continues to reach the operators. Most of the available supply is being handled through local and state fuel administrators. In most cases where it was evident there was actual suffering coal has been supplied, because of state fuel administrators' orders that homes must be protected with heat at the earliest possible moment, and regardless temporarily of the needs of manufacturing industries. During the week past there has been in effect an order that compelled the producer to ship 10 per cent. of his production to the state fuel administrator at some reconsigning point. This it was calculated would give a sufficient amount to relieve any urgent needs. However, the railroad break-down did not create the tonnage contemplated.

This order was rescinded late in the week, and a committee of association secretaries together with the president of the Coal Operators Association of Illinois, looked after, and worked with the state fuel administrators' orders on those cases that required immediate attention.

The appointment of J. D. A. Marrow, present secretary of the National Coal Association, as General Manager of Distribution, by Dr. Garfield has the hearty approval of coalmen throughout the Mid West. Many of the active operators firmly are convinced that with the coöperation of state and local coal association secretaries the question of distribution can and will be handled in a more satisfactory manner than by state and local fuel administrators. It is planned to organize a central bureau under the general direction of which all subsequent Illinois-Indiana and possibly Southwestern coal will be distributed.

CHICAGO

Chicago is still in the grip of the Weather Man, with no relief in sight.

Regardless of the action of the city fuel administrator in pooling, and confiscating all the coal in sight, Chicago is at this time in the grip of the most far-reaching fuel shortages ever experienced. When it is considered that with schools, both public and parochial, closed, hundreds of manufacturing plants observing Mondays as holidays, and not enough coal arriving each day to relieve urgent and distressing needs, we may understand how desperate the situation is.

There can be no relief until the railroads provide more cars and are able to get them moved to the customers. And railroad relief will be forthcoming when the present cold spell abates. City Fuel Administrator Durham is limiting deliveries to half tons, with the hope that production in some way will be stimulated, and more coal brought into this market at an early date so as to keep suffering down to a minimum.

In the meantime parent and civic organizations, are clamoring that schools be allowed to open, and that saloons be closed instead.

Quotations in the Chicago market are as shown in the table at the foot of the page per net ton f.o.b. cars at mines.

MILWAUKEE

Shipments of coal to interior points show an improvement. Rail receipts slow, owing to weather conditions. Illinois forbidden to confiscate Wisconsin-bound coal.

While snow-buried streets are seriously hindering coal deliveries in Milwaukee, the closing of factories for several days gave the railroads an opportunity to move fuel trains into the country, and the shipping record of the past week was about normal. Receipts of coal are considerably less than usual, however, owing to storm conditions. January receipts average 50,000 tons. Last January 160,000 tons were received, but this was unusual, as it included heavy consignments for the use of the railroads.

Fuel Administrator Fitzgerald has arranged to supply plants in the interior which are out of fuel with coal from Milwaukee, Superior and Sheboygan. More than 60 cars went out to such points on the 24th.

Cars loaded at Illinois and Indiana points for Wisconsin yards, factories and public utilities were confiscated while in transit by the fuel administrator of Illinois. This brought a protest from Mr. Fitzgerald, with the result that orders were issued from Washington forbidding a repetition of the practice.

Milwaukee has weathered the coal crisis and the outlook is that with the practice of reasonable economy no home or factory will suffer because of a lack of fuel. The delivery situation is strenuous, however. Four horses are necessary for a full-sized load and high-powered trucks make slow progress through the snow. The cost of delivery is eating up the profits of dealers and in many cases leads to loss. In one instance it cost $40 to deliver five tons of coal to a private sanitarium in the outskirts of the city, all of which fell upon the dealer.

Owing to complaints that coal dealers are exceeding the prices allowed by government regulations, the city of West Allis has inaugurated an investigation with the intention of making prosecutions.

ST. LOUIS

The St. Louis situation much easier. Weather moderated and enough coal coming in to take care of current needs. Railroad situation still extremely bad and mines idle for several days straight. Country districts in distress with promise of prompt relief. Steam needs in fair shape. No outside coal coming in.

The past week has been perhaps the most strenuous in the history of the St. Louis coal trade, but relief came about the middle of the week through the conservation methods employed and because of the system of distribution at work.

The railroad condition is in a deplorable shape. There does not seem to be any system at all in the St. Louis terminals for the regulation of traffic and it just happens along as it will and the contingencies permit.

The Illinois Central is still plugging along without anything definite in sight as to ability to take care of obligations. It is a case of perhaps we will and maybe we won't.

The eastern part of the State of Arkansas has been out of fuel and all efforts on the part of the fuel administrator for relief have brought but little relief from the Illinois field. That section of Louisiana depending upon Illinois is in the same condition, without coal. Southeast Missouri, however, suffers more than any other section. Between the roads from Williamson and Franklin County that lead into southeast Missouri confiscating coal and the other roads from the other fields placing embargoes against that gateway, a condition has been brought about that is shameful when one considers that the country as a whole should bear the burden and that one section should not be deprived of necessary fuel to cater to the white-way life of another.

For one week Missouri was a lightless state. Practically everything closed at 7 o'clock. Administrator Crossley lifted this for the coming week on certain lines until 11 o'clock, but four-fifths of all business for the present week closes at 7 p. m., excepting factories working on Government orders.

Throughout the State, while there are sections that are without coal, these are being taken care of promptly during the present week and the coal is distributed so that while there is no surplus anywhere it is the aim not to have any suffering in any section.

In Williamson and Franklin County the conditions are not good. The railroad tonnage seems to be getting greater and such available domestic coal as is produced goes to the northern markets, while the natural markets of the past, west of the river, are getting practically nothing. There are no rates to many of these points from any other regions than the Carterville field, and coal can't be shipped there.

In the Du Quoin field conditions are about the same. Mt. Olive is not much different. The railroads seem to be getting the bulk of this coal, although more of this tonnage is coming into St. Louis than coal from the Carterville or Du Quoin field.

In the Standard field the mines have had extremely poor working time. Some mines worked only two days this past week and since the snow storm some mines have gone for ten days straight without working. It is estimated that about a quarter million tons of coal from the southern Illinois fields have been lost through railroad inefficiency in the course of two weeks time.

The Terminal condition at St. Louis is not good. Cars have been hanging around the Terminals for upwards of three and four weeks and are still undelivered. The railroads still continue to confiscate coal and are not making prompt reports to either consignees or shippers.

The conference in Kansas City this week between the administrators of Iowa, Nebraska, Missouri, Kansas, Oklahoma and Arkansas brought forth the fact that all of these States were opposed to the zoning of the southern Illinois field unless the zone comprising the above States included certain producing zones in the southern Illinois region.

They did, however, go on record as being opposed to the zoning of the country west of the Indiana state line, showing they had no confidence in the zone system as proposed by the Illinois operators excepting those in the 5th and 9th districts.

They further recommended that the Fuel Administrator arrange for a reduction of 75c. a ton on April 1 from all fields, this to increase 15c. a month to assure the early storage of coal.

The local situation is easy. Small consumers are being taken care of and steam plants have normal requirements.

The prevailing market is as follows per net ton f. o. b. mine:—

	Williamson and Franklin County	Mt. Olive and Staunton	Standard
6-in. lump	$2.65@2.80	$2.65@2.80	$2.65@2.80

CURRENT PRICES—MATERIALS & SUPPLIES

IRON AND STEEL

PIG IRON—Below are the present quotations, with a comparison of a month and a year ago:

CINCINATI	Jan. 30, 1918	One Month Ago	One Year Ago
No. 2 Southern foundry	$35.90	$35.90	$18.90
No. 2 Northern foundry	35.90	35.90	21.76
NEW YORK			
No. 2X Northern foundry	34.25	34.25	22.00
No. 2 plain Northern foundry	33.75	33.75	21.00
No. 2 Southern foundry	37.25	37.25	22.00
BIRMINGHAM			
No. 2 Southern foundry	33.00	33.00	16.00
CHICAGO			
No. 2 Northern foundry	33.00	33.00	22.00
No. 2 Southern foundry	37.00	37.00	....
PITTSBURGH			
Bessemer iron*	37.25	37.25	24.95
Basic iron*	33.95	33.95	20.95

*These prices include the freight charge from the valley to the Pittsburgh district. †Delivered Tidewater, New York.

Note—On Sept. 24 the President approved the new schedule of steel prices, that of pig iron being set at $33.

STRUCTURAL MATERIAL—The following are the base prices, f.o.b. mill, Pittsburgh, together with the quotations per 100 lb. from warehouses at the places named:

	Mill, Pittsburgh	New York, Jan. 30, 1918	New York, 1 Year Ago	St. Louis	Chicago
Beams, 3 to 15 in.	$3.00	$4.195	$3.25	$4.27	$4.20
Channels, 3 to 15 in.	3.00	4.195	3.25	4.27	4.20
Angles, 3 to 6 in., ¼ in. thick	3.00	4.195	3.25	4.27	4.20
Tees, 3 in. and larger	3.05	4.245	3.40	4.27	4.25
Plates	3.225	4.45	4.00	4.52	4.45

BAR IRON—Prices in cents per pound at cities named are as follows:

	Pittsburgh	St. Louis	Denver	Birmingham
Dec. 31, 1917	3.50	4.45	4.05	4.50

NAILS—Prices per keg from warehouse in cities named:

	Mill, Pittsburgh	St. Louis	Denver	Chicago	San Francisco	Dallas
Wire	$3.50	$4.30	$4.85	$4.25	$4.60	$4.50
Cut	4.00	5.25	....	4.40	6.15	....

TRACK SUPPLIES—The following prices are base per 100 lb. f.o.b. Pittsburgh for carload lots, together with the warehouse prices at the places named:

	Pittsburgh, Jan. 30, 1918	Pittsburgh, One Year Ago	Cincinnati	Chicago	St. Louis	San Francisco	Birmingham	Denver
Standard railroad spikes ⅝-in. and larger	$3.90	$2.65	$6.00	$5.00	$6.45	$7.25	$5.30	$5.00
Track bolts	4.90	3.25	8.90	6.25	Premium	8.80	6.75	6.00
Standard section angle bars	3.25	2.00	....	4.50	Premium	4.65	....	....

COLD DRAWN STEEL SHAFTING—From warehouse to consumers requiring fair-sized lots, the following discounts hold:

Cincinnati	Cleveland	Chicago	St. Louis	Denver	Birmingham
17½%	List	+10%	+10%	+35%	+20%

HORSE AND MULE SHOES—Warehouse prices per 100 lb. in cities named:

	Mill Pittsburgh	Cincinnati	Chicago	St. Louis	Denver	Birmingham
Straight	$4.75	$6.30	$6.50	$6.00	$7.50	$6.25
Assorted	4.90	6.30	6.50–7.00	6.25	7.75	6.50

CAST-IRON PIPE—The following are prices per net ton for carload lots:

	New York, Jan. 30, 1918	New York, 1 Month Ago	New York, One Year Ago	Chicago	St. Louis	San Francisco	Dallas
4 in.	$58.35	$58.35	$44.50	$57.30	$57.00	$66.40	$61.00
6 in. and over	55.35	55.35	41.50	54.30	54.00	63.40	58.00

Gas pipe and 16-ft. lengths are $1 per ton extra.

STEEL RAILS—The following quotations are per ton f.o.b. Pittsburgh and Chicago for carload or larger lots. For less than carload lots 5c. per 100 lb. is charged extra:

	Pittsburgh, Jan. 30, 1918	Pittsburgh, One Year Ago	Chicago, Jan. 30, 1918	Chicago, One Year Ago
Standard bessemer rails	$65.00	$38.00	....	$38.00
Standard openhearth rails	67.–68.	40.00	....	40.00
Light rails, 8 to 10 lb.	....	52.00	....	47.00
Light rails, 12 to 14 lb.	....	52.00	....	46.00
Light rails, 25 to 45 lb.	67.00*	50.00	$67.00*	44.00

*Government price of $3.00 per 100 lb. Note:—Combria Steel Co. reported to be taking orders for standard sections.

OLD MATERIAL—Prices per net ton in Chicago and St. Louis (including delivery to buyer's works and freight transfer charges):

	Chicago, Jan. 30, 1918	Chicago, One Month Ago	St. Louis, Jan. 30, 1918	St. Louis, One Month Ago
No. 1 railroad wrought	$31.25	$29.50	$30.50	$31.00
Stove plate	21.50	16.00	20.50	16.50
No. 1 machinery cast	26.00	20.00	26.00	21.50
Machine shop turnings	17.00	16.50	17.50	16.75
Cast borings	16.50	16.50	17.00	16.00
Railroad malleable cast	26.80	26.50	26.00	25.50

COAL BIT STEEL—Warehouse price per pound is as follows:

New York	Cincinnati	Birmingham	St. Louis	Denver
$0.12	$0.16½	$0.16	$0.15	$0.16

DRILL STEEL—Warehouse price per pound:

	New York	St. Louis
Solid	14c.	16c.
Hollow	24c.	25c.

PIPE—The following discounts are for carload lots f.o.b. Pittsburgh; basing card of Nov. 6, 1917, for steel pipe and for iron pipe:

BUTT WELD

Steel, Inches	Black	Galvanized	Iron, Inches	Black	Galvanized
⅛, ¼ and ⅜	44%	17%	¾ to 1½	33%	17%
½	48%	33½%			
¾ to 3	51%	37½%			

LAP WELD

2	44%	31½%	2	26%	12%
2½ to 6	47%	34½%	2½ to 4	28%	15%
			4½ to 6	28%	15%

BUTT WELD. EXTRA STRONG PLAIN ENDS

⅛, ¼ and ⅜	40%	22½%	¾ to 1½	33%	18%
½	45%	36½%			
¾ to 1½	49%	36½%			

LAP WELD. EXTRA STRONG PLAIN ENDS

2	42%	30½%	2	27%	14%
2½ to 4	45%	33½%	2½ to 4	29%	17%
4½ to 6	44%	32½%	4½ to 6	28%	16%

From warehouses at the places named the following discounts hold for steel pipe:

	Black, New York	Black, Chicago	Black, St. Louis
¾ to 3 in. butt welded	38%	42.8%	40.1%
3½ to 6 in. lap welded	18%	38.8%	36.1%

	Galvanized, New York	Galvanized, Chicago	Galvanized, St. Louis
¾ to 3 in. butt welded	22%	27.8%	25.1%
3½ to 6 in. butt welded	List	24.8%	22.1%

Malleable fittings, Class B and C, from New York stock sell at list price. Cast iron, standard sizes, 15 and 5%.

SHOP SUPPLIES

NUTS—From warehouse at the places named, on fair-sized orders the following amount is deducted from list:

	New York, Jan. 30, 1918	New York, One Year Ago	Cleveland, Jan. 30, 1918	Cleveland, One Year Ago	Chicago, Jan. 30, 1918	Chicago, One Year Ago
Hot pressed square	$1.00	$0.50	$1.40	$2.60	$1.05	$3.00
Hot pressed hexagon	1.00	.50	1.20	2.60	.85	3.00
Cold punched square	1.00	.50	.75	3.00	1.00	2.50
Cold punched hexagon	1.00	.50	.75	3.00	1.00	3.00

Semifinished nuts sell at the following discounts from list price:

	Dec. 31, 1917	One Year Ago
New York	40%	50%
Cleveland	60%	50—10%
Chicago	50%	50—10%
St. Louis	50—10%	....

MACHINE BOLTS—Warehouse discounts in the following cities:

	New York	Cleveland	Chicago	St. Louis
⅜ by 4 in. and smaller	30%	50%	40—10%	40%
Larger and longer up to 1 in. by 30 in.	15%	40%	30—5%	30—5%

WASHERS—From warehouses at the places named the following amount is deducted from list price:

For wrought-iron washers:

New York..$1.00 Cleveland..$2.00 Chicago..$3.00 St. Louis..$3.00

For cast-iron washers the base price per 100 lb. is as follows:

New York..$5.00 Cleveland..$4.50 Chicago..$3.50 St. Louis..$2.75

RIVETS—The following quotations are allowed for fair-sized orders from warehouse:

	New York	Cleveland	Chicago
Steel ⅞ and smaller	30%	35%	40%*
Tinned	30%	35%	40%*

*For less than keg lots the discount is 35%.

Button heads, ¾, ⅞, 1 in. diameter by 2 in. to 5 in., sell as follows per 100 lb.:

New York .... $7.00 Cleveland .... $5.85 Chicago $5.50

Coneheads, same sizes:

New York .... $7.10 Cleveland .... $5.95 Chicago $5.60

MISCELLANEOUS

GREASES—Prices are as follows in the following cities in cents per pound for barrel lots:

	Cincinnati	Chicago	St. Louis	Birmingham	Denver
Cup	7	5¼	6.1	8½	10
Fiber or sponge	8	6	6.4	15	15
Transmission	7	6	6.4	10	15
Axle	4½	4	3.3	3	5
Gear	4½	4½	6.5	5½	5½
Car journal	22 (gal.)	3½	4.6	5	5

BABBITT METAL—Warehouse prices in cents per pound:

	New York		Cleveland		Chicago	
	Jan. 30, 1918	One Year Ago	Jan. 30, 1918	One Year Ago	Jan. 30, 1918	One Year Ago
Best grade	70.00	60.00	93.00	51.25	70.00	50.00
Commercial	40.00	30.00	21.50	18.50	25.00 to 30.00	20.00

HOSE—Following are prices of various classes of hose:

Fire

	50-Ft. Lengths
Underwriters' 2½-in.	75c. per ft.
Common, 2½-in.	40%

Air

	First Grade	Second Grade	Third Grade
¾-in. per ft.	$0.55	$0.30	$0.25

Steam—Discounts from list

First grade... 30% Second grade... 30-5% Third grade... 40-10%

LEATHER BELTING—Present discounts from list in cities named:

	Medium Grade	Heavy Grade
St. Louis	45%	40%
Denver	40%	40%
Birmingham	35%	40%
Chicago	30—10%	40—5%
Cincinnati	40—10%	40%

RAWHIDE LACING—40% off list.

PACKING—Prices per pound:

Rubber and duck for low-pressure steam	$0.77
Asbestos for high-pressure steam	1.54
Duck and rubber for piston packing	.88
Flax, regular	.66
Flax, waterproofed	.99
Compressed asbestos sheet	.99
Wire insertion asbestos sheet	1.21
Rubber sheet ¼	.55
Rubber sheet, wire insertion	.88
Rubber sheet, duck insertion	.44
Rubber sheet, cloth insertion	.25
Asbestos packing, twisted or braided, and graphited, for valve stems and stuffing boxes	1.10
Asbestos wick, ½- and 1-lb. balls	.65 to .70

WIRE ROPE—Discounts from list price on regular grades of bright and galvanized are as follows:

	New York	St. Louis
Galvanized iron rigging	List + 20%	+20%
Galvanized cast steel rigging	Net List	List
Bright plain rigging	30%	30%
Bright cast steel	17½%	17½%
Bright iron and iron tiller	5%	5%

MANILA ROPE—For rope smaller than ⅝-in. the price is ½ to 2c. extra; while for quantities amounting to less than 600 ft. there is an extra charge of 1c. The number of feet per pound for the various sizes is as follows: ⅝-in., 8 ft.; ¾-in., 6; ⅞-in., 4½; 1 in., 3½; 1⅛-in., 2 ft. 10 in.; 1¼-in., 2 ft. 4 in. Following is the price per pound for ⅝-in. and larger, in 1200-ft. coils:

Boston	$0.35½	Kansas City	$0.33½
New York	.34	Los Angeles	.33½
Chicago	.32½	Seattle	.33½
Denver	.33½	St. Louis	.33
Birmingham	.37	Cincinnati	.33

PIPE AND BOILER COVERING—Below are discounts and part of standard lists:

PIPE COVERING

Pipe Size	Standard List Per Lin.Ft.
1-in.	$0.27
2-in.	.36
6-in.	.80
4-in.	.60
3-in.	.45
8-in.	1.10
10-in.	1.30

BLOCKS AND SHEETS

Thickness	Price per Sq.Ft.
½-in.	$0.27
1 -in.	.30
1½-in.	.45
2 -in.	.60
2½-in.	.75
3 -in.	.90
3½-in.	1.05

85% magnesia high pressure ..... 15% off

For low-pressure heating and return lines..... 4-ply.... 58% off; 3-ply.... 60% off; 2-ply.... 62% off

LINSEED OIL—These prices are per gallon:

	New York		Cleveland		Chicago	
	Jan. 30, 1918	One Year Ago	Jan. 30, 1918	One Year Ago	Jan. 30, 1918	1 Year Ago
Raw per barrel	$1.31	$0.96	$1.35	$1.00	$1.32	$0.98
5-gal. cans	1.41	1.06	1.50	1.10	1.45	1.08

WHITE AND RED LEAD in 500-lb. lots sell as follows in cents per pound:

	Red				White	
	Jan. 5, 1918		1 Year Ago		Jan. 5, 1918	1 Yr. Ago
	Dry	In Oil	Dry	In Oil	Dry and In Oil	Dry and In Oil
25- and 50-lb. kegs	11.50	11.00	10.50	11.00	10.50	10.50
12½-lb. keg	11.75	11.25	10.75	11.25	10.75	10.75
100-lb. keg	11.25	11.50	11.00	11.50	11.00	11.00
1- to 5-lb. cans	13.25	13.00	12.50	12.50	13.00	12.50

CALCIUM CARBIDE—Price f.o.b. cars at warehouse points in Eastern States is $102.50 per ton for Union miners' lamp carbide, and $97.50 per ton for Cameo miners' lamp carbide. Union sells in 25-lb. cans for $1.46 per can.

COMMON BRICK—The prices per 1000 in cargo or carload lots are as follows:

Cincinnati	$13.50	Birmingham (clay)	$8.00
St. Louis, salmon	8.06	Birmingham (shale)	9.00
Denver	8.50		

FUEL OIL—Price variable, depending upon stock. New York quotations not available owing to this fact. In Chicago and St. Louis the following prices are quoted:

	Chicago	St. Louis
Domestic light, 22-26 Baumé	5c.	5½c.
Mexican heavy, 12-14 Baumé	7c.	none

PREPARED ROOFINGS—Standard grade rubbered surface, complete with nails and cement, costs per square as follows in New York and Chicago:

	1-Ply		2-Ply		3-Ply	
	c.l.	l.c.l.	c.l.	l.c.l.	c.l.	l.c.l.
No. 1 grade	$1.15	$1.40	$1.45	$1.60	$1.75	$1.90
No. 2 grade	1.10	1.25	1.25	1.40	1.50	1.65

Asbestos asphalt-saturated felt (14 lb. per square) costs $6.50 per 100 lb.

Slate-surfaced roofing (red and green) in rolls of 108 sq.ft. costs $1.85 per roll in carload lots and $2.10 for smaller quantities.

Shingles, red and green slate finish, cost $4.75 per square in carloads, $5 in smaller quantities, in Philadelphia.

ROOFING MATERIALS—Prices per ton f.o.b. New York or Chicago:

	Carload Lots	Less Than Carload Lots
Tar felt (14 lb. per square of 100 sq.ft.)	$61.00	$62.00
Tar pitch (in 400-lb. bbl.)	15.00	16.50
Asphalt pitch (in barrels)	29.00	30.50
Asphalt felt	60.00	62.00

STEEL SHEET PILING—The following price is base per 100 lb. f.o.b. Pittsburgh, with a comparison of a month and a year ago:

Jan. 30, 1918	One Month Ago	One Year Ago
$4.50 to $5.00	$4.50 to $5.00	$2.60 to $2.70

HOLLOW TILE—The price per 1000 in carload lots f.o.b. mine is as follows:

	4 x 12 x 12	8 x 12 x 12
St. Louis	$79.00	$135.00
Chicago	79.00	137.00
Denver, per ton	110.00	200.00
Kansas City	58.00	112.00
St. Paul	55.00	138.00
Boston	95.00	171.00
Birmingham	56.80	106.50
Cincinnati	68.80	129.00

LUMBER—Price of yellow pine per M in carload lots:

	1-In. Rough, 10 In. x 16 Ft.	2-In. T. and G.	8 x 8 In. x 20 Ft.
St. Louis	$33.00	$30.00	$31.50
Denver	29.50	32.50	41.75
Birmingham	25.00	23.00	24.00
Cincinnati	35.00	37.50	35.00

Price per M in carload lots:

	1-In. Rough, 10 In. x 16 Ft. and Under			2-In. T. and G. 10 In. x 16 Ft.

FREIGHT RATES—On finished steel products in the Pittsburgh district, including plates, structural shapes, merchant steel, bars, pipe fittings, plain and galvanized wire nails, rivets, spikes, bolts, flat sheets (except planished), chains, etc., the following freight rates are effective in cents per 100 lb.:

Boston	21.5	Minneapolis	35.5
Buffalo	11.6	New Orleans	30.7
Chicago	21.5	New York	19.5
Cincinnati	18.5	Philadelphia	18.5
Cleveland	13.5	St. Louis	27.0
Denver	79.0	St. Paul	35.5
Kansas City	47.0	Pacific Coast (all rail)	90.0

COAL AGE

Vol. 13 NEW YORK, FEBRUARY 9, 1918 No. 6

Wars Are Not Won By Contraction

By Floyd W. Parsons

AGENTS of Germany, if granted freedom of action here in the United States today, could not do more for the Kaiser than has been accomplished by those Americans who are daily advocating the curtailment of industry.

No man can win a race who starts in believing that he must slow down his speed to accommodate the pinch of a shoe that hurts. The wise runner would throw off the ill-fitting shoe and put on one that wouldn't hamper his gait.

Instead of correcting the weak link in our industrial life, which is transportation, we seek the easy way out and lay off all other effort, hoping that summer winds will come soon and blow away our troubles.

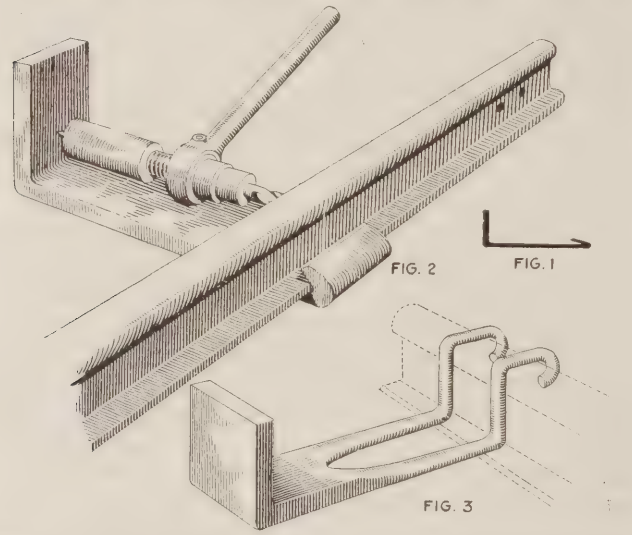
DIRECTOR GENERAL McADOO two weeks ago could not see the advisability of a freight embargo. Fuel Administrator Garfield consequently took the only step possible to relieve the freight congestion and shut down production. As a purely fuel-conservation measure, the closing-down order is not in any way justified. As a railroad remedy it did some good, for it permitted the release of hundreds of miles of cars that were blocked at many points. On the Chesapeake & Ohio R.R. there were 80 miles of cars loaded with coal, and 75 miles of such cars stood on sidings in the Pittsburgh district. Such congestions have been broken up, but an extensive freight embargo would have done the job better and cheaper.

Such a winter as this has not been known before. We were not prepared, and a crisis developed. The closing-down plan was ordered by the Fuel Administrator, but it was forced by the Railroad Director, who would not recognize the need of a general freight embargo. The "fuelless" Mondays would not have been continued, in spite of the hysterical protestations of several of the State Administrators, if Mr. McAdoo had consented to the embargo plan this week.

AS A result of the whole controversy, the United States today is trying to win its fight by poking with one hand instead of smashing with both fists. If the situation is so critical, then why not spend a few million dollars directly relieving freight congestion? Why not insist on a heavy demurrage charge? Why not build temporary terminal facilities and get the cars unloaded and moving? Why not notify consignees within something less than two weeks that shipments have arrived? Why not give two days' notice and discontinue passenger service 48 hours, repeating if necessary, using the passenger locomotives to increase freight-moving motive power? A few mail trains might be run with a passenger car attached to carry Government officials on necessary business. The biggest thing about this idea is the clear tracks thus provided for freight movement.

This is an extraordinary occasion, and it calls for extraordinary treatment. If the railroads have slowed us up, let us rather insist that they go faster and not that the whole Nation shall go slower. Exhilaration comes from breaking records; only dejection and discouragement result from curtailed effort. We talk of loaning money to other peoples; why not loan ourselves a little in a crisis? The more severe the weather conditions, the more men and money that must be employed.

WHAT is to be the effect of all this enforced idleness and reduced earnings on the next Liberty Loan? What is the effect of such a policy on the spirit of a people, 99 per cent. of whom submit but do not approve? What is to be gained by forcing a remedy on the railroads that they maintain is ineffective? Why assume responsibility for forcing restrictions that would have come automatically, been more equitable and less destructive?



Mr. McAdoo has control of the railroads and at the same time is custodian of Uncle Sam's money. Congress wants to win the war and will pay to do it. The workmen of the Nation are a willing lot. There, Mr. McAdoo, is the formula—Railroads, Money, Men. The mines are working but three or four days a week, and the people are shivering in idleness. We ask you, Mr. Railroad Director, "What's the answer?" Isn't the solution in your hands?

IDEAS AND SUGGESTIONS

Rail Bonding and Drilling

BY FRANK HUSKINSON
Trinidad, Colo.

It is important in maintaining an electric haulage system in a coal mine to keep the tracks well bonded. Both rails should be bonded and cross-bonds put in at least every 100 yd. At all switches and frogs the circuit should be complete. This may be accomplished by the use of long jumpers of wire, bonded to the rails and run around the switch and frog. The system should be inspected regularly to see that this bonding is kept

FIGS. 1 TO 3. DEVICES FOR HOLDING A RATCHET DRILL IN PLACE WHEN DRILLING RAILS

in proper shape. A poorly bonded track is a source of grief and expense. In addition to causing delays and cutting down the output, it results in excessive heating of the fields and armature coils in the locomotives, in some instances causing these coils to heat to such a degree that the insulation becomes so badly charred that the coils will short-circuit within themselves and take an excessive amount of current. In a short time it then becomes necessary to rewind the armatures and replace the field coils.

At almost all mines there is a machine for drilling the rails for bonds and fishplates, but there are times and places where the machine cannot be used and it is necessary to adopt other methods for drilling the rails for bonds and bolts. For this purpose a ratchet drill and old man may be employed.

In Figs. 1, 2 and 3 are shown two good devices called "old men." I have used these for holding the ratchet drill when drilling rails. The old man shown in Figs. 1 and 2 is simple and handy. It hooks underneath the rail, and if the ratchet drill is set up on the outside of the track it can be left in place whenever a trip passes, as it is in the clear. The ratchet handle must be left lying flat, however, so as to clear the locomotive and cars.

The old man shown in Fig. 3 is hooked over the top of the rail and is only used in places where the other devices cannot be employed. This one has two prongs that hook over the top of the rail. These prongs are separated about 1 or 2 in. so as to allow the drill to operate between them. These attachments can be easily and quickly put on or removed from the rails.

I have also found it a good plan to have at least two of these devices the only difference in them being the length. One is for use with long drills and the other for short drills. This is more satisfactory than using blocking in a long attachment to compensate for a short drill.

Survey of Industrial Power Plants To Determine Coal-Burning Efficiency

BY F. H. SPARKS
Louisville, Ky.

The recent action of Dr. Garfield, the United States Fuel Administrator, in closing industrial plants on certain days will undoubtedly relieve the present serious shortage in fuel, but it will hardly correct some of the faults that are largely responsible for present conditions; and if suggestions for the permanent correction of almost criminal waste of coal as burned under many boilers in industrial plants are welcome, I suggest measures be put into effect which will place the burden of responsibility on those who through a "penny-wise-and-pound-foolish" policy have neglected to put their plants on an efficient fuel-burning basis, and who in a very large measure have contributed to this present condition of fuel shortage.

If A evaporates 10 or 12 or more pounds of water with every pound of coal burned, and B evaporates but 5 or 6 lb. of water with a pound of the same coal, the natural deduction is that something is wrong with B's plant, or with his method of burning coal; and before taking A's coal from him and dividing it with B, would it not be well to investigate the conditions of coal burning at both plants and learn why A evaporates twice as much water with a pound of coal as does B?

Any competent engineer can survey an industrial plant and determine just how much coal, efficiently burned, will be required to operate the plant.

Now, would it not be a good plan, and teach a lasting lesson, to have made surveys of all industrial plants using coal under boilers, to determine just the amount of coal necessary to operate each plant, and then allow each plant per day or week or month, just the amount shown by the survey as necessary?

For instance, if a plant has been burning 1000 tons of coal per month under inefficient methods, and the survey shows that, efficiently burned, 500 tons would carry the load, then say to the manager of that plant: "Efficiently burned, 500 tons of coal per month will

carry your load, and we will allow you just that amount. If you care to burn up 500 tons in half that time, you may then shut your plant down—or use the balance of the time to put your plant on an efficient coal-burning basis."

The chances are good that the man who is burning coal efficiently is also operating his whole plant efficiently, and his is the plant that should be permitted and encouraged to operate continuously. Therefore, I suggest an investigation of the methods of burning coal under boilers in all industrial plants, and the instituting of corrective measures wherever waste is shown.

Safety Switch Boxes

By Electrical Engineer

A wise provision of the state law in regard to the electrical equipment in and around a coal mine is that all electric switches shall have a suitable guard or protection around them, making it impossible for any person to come in contact with the metal parts of the switch. In order to comply with this law, I made up quite a number of safety switch boxes, as shown in Fig. 1. This is the cheapest and most reliable safety switch box I know of. It consists of only six pieces of fireproofed wood—the back, two sides, the front and the two-piece top. The switch is mounted on the back

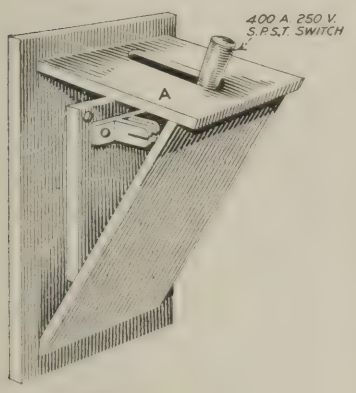


FIG. 1

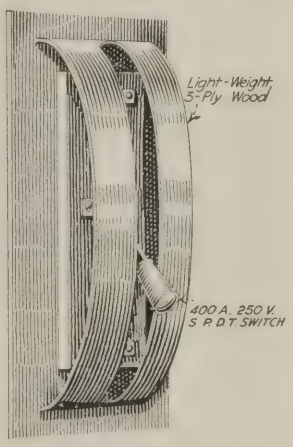

FIG. 2

FIGS. 1 AND 2. TWO TYPES OF SWITCH BOXES THAT ARE SAFE AND ECONOMICAL

board, while the top pieces are so fitted as to allow only sufficient room for the handle of the switch to operate in. In this style of switch box only the wooden handle of the switch is visible, and this is the only part of the switch that can be taken hold of.

In Fig. 2 is shown a safety box for a double-throw switch. This is an excellent switch box for this type of switch. The back and sides are made of plain fireproofed wood, while the front is constructed of three-ply light-weight built-up board. This material is flexible and can be shaped easily. A slot is cut in the front just large enough to allow the switch handle to project through. This makes a safe and reliable switch box.

These two switch boxes were devised after a series of experiments with various kinds of guards and boxes, and were only adopted as standard after they had proved themselves successful and had passed a rigid examination by the mine inspectors. The boxes are given two coats of paint. This results in a neat appearance and prevents the wood from absorbing any moisture.

I have found it a good idea to give all switch bases a coat or two of shellac. This prevents the slate from absorbing moisture. I have had trouble with slate bases absorbing moisture, this causing a considerable leakage of current across the switch terminals; not enough to light a lamp, but enough so that a person or a mule coming in contact with the trolley line would receive a severe shock. I have found that the use of shellac will prevent this leakage. It is therefore recommended that all switch bases be given two coats.

The use of untreated asbestos for lining switch boxes is satisfactory in dry places; in damp places the asbestos should be given at least two or preferably three coats of shellac to prevent its absorbing moisture. Another good idea is to have a lamp burning at all times inside the switch box or cabinet in damp places. This gives a visual signal that the current is on and keeps the switch box dry and safe.

One of the rules in installing switches that is often overlooked is that a knife-switch should always be placed in such a position that the blade will have a tendency to fall out, or open. Always connect the live, or positive, side of the line to the stationary contact of a switch, never to the blade, or hinged, part.

The Issue of the Day

By Robert Littlehales
Smithton, Pennsylvania

Coal mining, like other industries, has advanced rapidly in the last few years. It has kept pace with the times. Modern equipment, systematic extraction and efficient management have replaced the crude methods of former days.

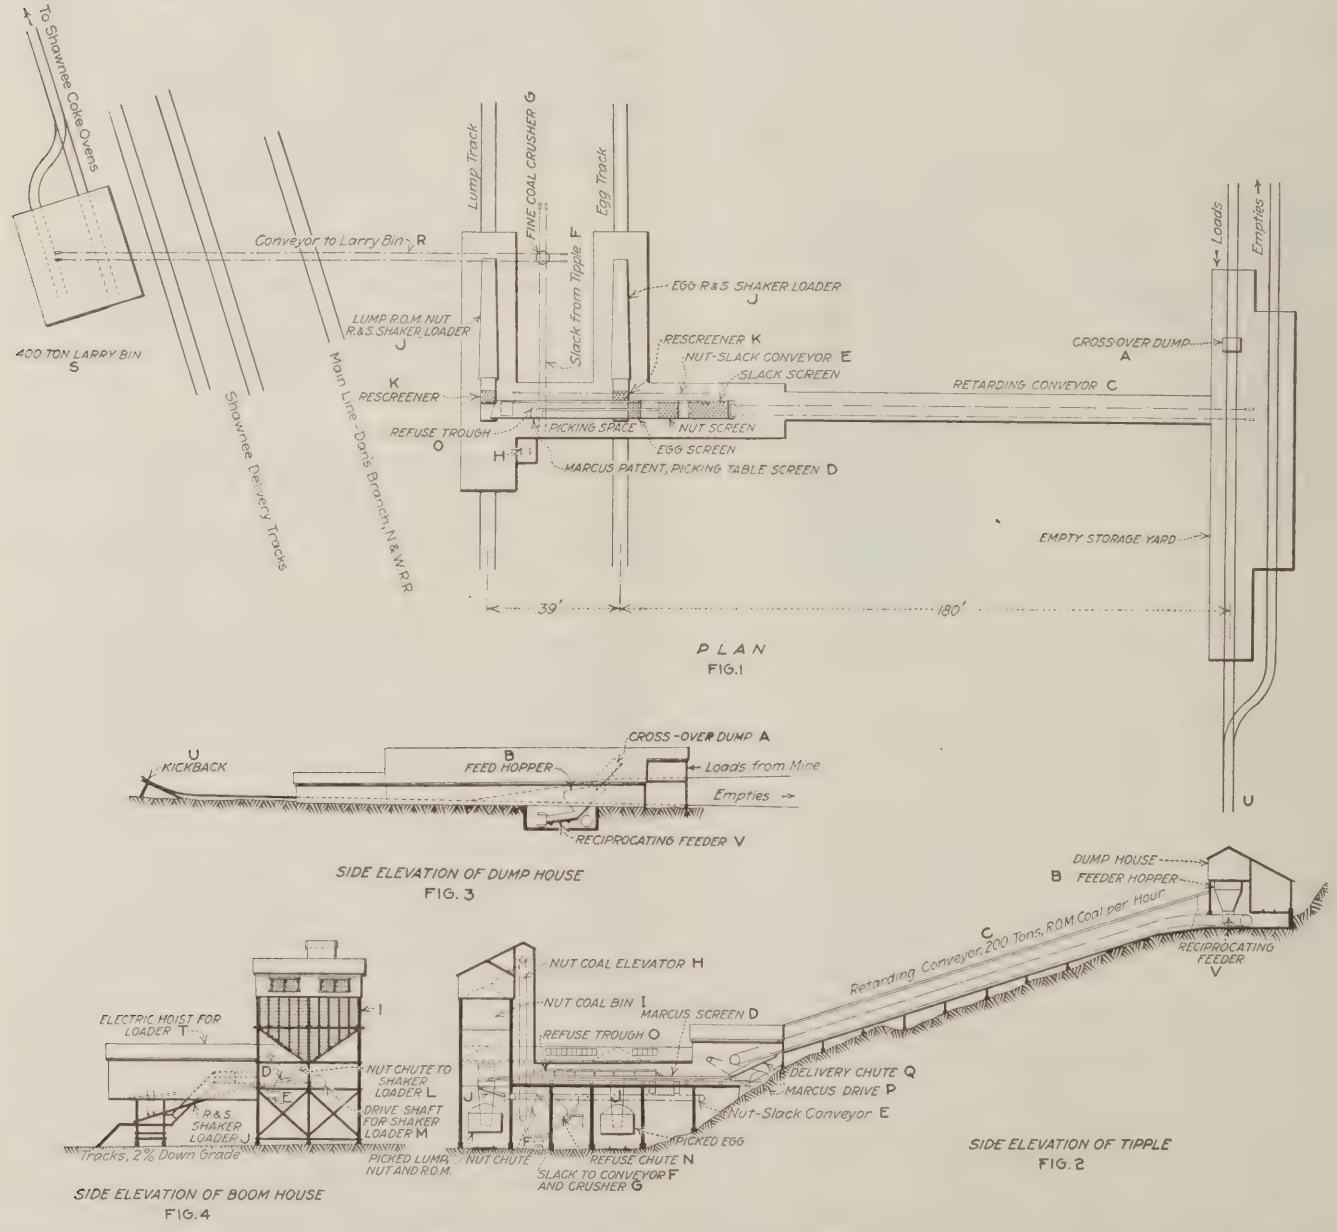
A mine official's training, today, should embody more than mere practical knowledge. I will admit, however, that it is essential; but without technical training an official is greatly handicapped. The combination of the two makes him a more efficient manager; consequently, he is more qualified to take care of any situation that may arise.

The past few years have brought about considerable mechanical changes in coal mining, but there is still a greater movement of a similar nature on foot. The coal-mining industry is fast approaching a revolutionary state. Too much handling of coal is still required; some kind of mechanical conveyance would remedy the evil. In any crisis or difficulty, whether it be political, religious or industrial, there are always some who will arise and meet the issue, bringing about victory from defeat and success from seeming impossibility.

Necessity is the mother of invention; likewise opportunity is the maker of men. What are you doing to meet the issue?

In Canada the Coal Content of the Western coal beds is estimated to amount to 1,217,386,000,000 tons, of which 830,000,000 tons are anthracite and semi-anthracite, 282,313,000,000 tons bituminous, 847,821,000,000 tons sub-bituminous, and 86,422,000,000 tons lignite. This coal is found in the geological ages between the lower Cretaceous and the Tertiary.

Preparing No. 3 Pocahontas Coal



By RICHARD G. MILLER
Chicago, Ill.

THE Pulaski Iron Co., of which Percival Johnson is general manager at Pulaski, Va., and Floyd E. Cunnyngham is superintendent of coal mines, has been operating its coal property of approximately 1400 acres at Eckman, W. Va., for more than 25 years. The plant, including the entire top works with beehive coke ovens, handles the entire output, and until recently over an inadequate tipple, containing various types of screening, picking, conveying and elevating machinery unsuitable and, for the most part, unnecessary in modern preparation.

This company is generally recognized in the "Pocahontas Field" as being progressive but, at the same time, wisely conservative. Handicapped by the improper kind of equipment for cleaning and preparing No. 3 Pocahontas coal (one of the most friable coals known), and having an existing plant of large proportions, it faced a problem which called for increased capacity and simultaneously the best preparation possible to obtain.

It also became necessary to increase the coke-oven capacity. This naturally required a larger tonnage of run-of-mine coal over the preparation plant. The company was enabled to acquire the coking facilities of the Shawnee Co. nearby, increasing the annual coke output from 100,000 to 150,000 tons. Arrangements were accordingly made to deliver the necessary crushed coal to that point as well as to continue supplying the ovens on its own site, as formerly.

The type of preparation plant and machinery adopted was the result of a thorough investigation, locally and in other fields, with the idea of getting a modern plant

FIGS. 1 TO 4. GENERAL ARRANGEMENT OF PLANT, INDICATING TYPE AND CHARACTER OF CONVEYING MACHINERY

that would reduce maintenance and labor, and at the same time increase efficiency. Moreover, it was important that the building and installation of the new plant closely adjacent to the existing structures should not interfere with continuous operation.

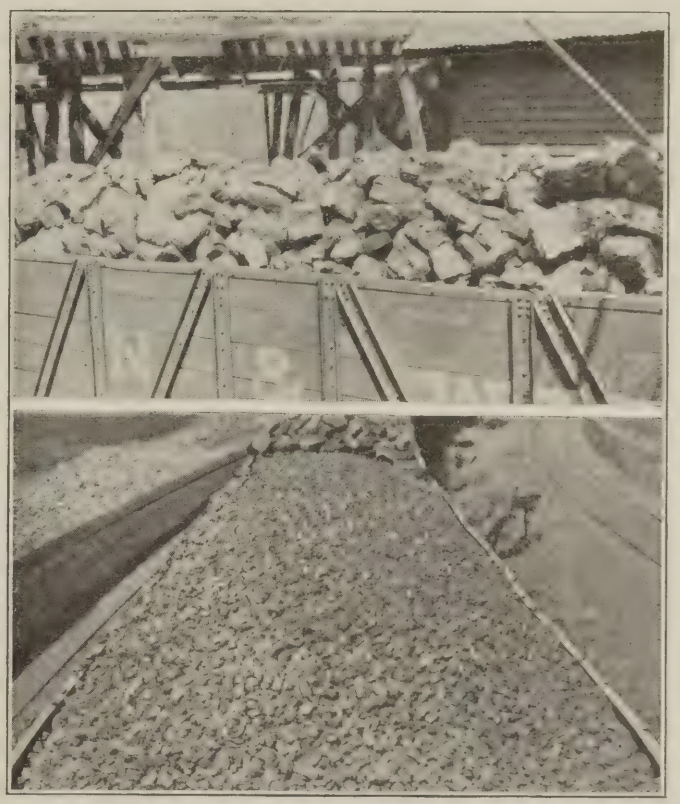
The following descriptions and explanations illustrate the type and character of machinery adopted to fulfill the special conditions and meet the needs of the Pulaski company. This plant effects the saving of ten men in its operation over the old plant. The entire new plant is electrically operated with 250 volts direct current, generated locally.

The general arrangement is clearly shown in Fig. 1. The new equipment immediately adjoins the existing plant, the retarding conveyor *C* being but 50 ft. away. Trips of loaded mine cars are delivered to the dump-house, Fig. 3, over the Phillips crossover dump *A*, and thence to the kickback *U*, which in this case is of unusual proportions because of the fact that the grades had to be worked in with the existing haulage systems from three mine openings. This feature had the attendant advantage of providing a storage yard for empties, which greatly facilitates operation.

Run-of-Mine Delivered by Reciprocating Feeder

In the side elevation of the tipple, Fig. 2, it may be noted that run-of-mine coal is delivered from the feeder hopper *B* to the retarding conveyor *C* by the reciprocating feeder *V*. This is so constructed as to inclination, mechanical features and speed that it prevents leakage of fine coal at the rear end.

The retarding conveyor *C* is composed of two strands of standard, long-pitch, steel-thimble roller chain, carrying strong steel flights that control the travel of the coal and permit its easy delivery over the chute *Q* onto the Marcus patent picking table screen *D*. This prepares four sizes and at the same time enables pickers to remove refuse and dispose of it onto the refuse trough *O*, over which it is conveyed to the refuse chute *N* for disposal by carts.



The Marcus, in conjunction with the "Rands" shaker loaders *J*, Fig. 4, made possible the simplicity of design which would have been very difficult to obtain by other means. On the screen, the coal passes successively over $1\frac{1}{8}$ in., 2 in., and 4 in. in diameter circular perforations, as well as the blank picking spaces where the pickers thoroughly clean it and remove all impurities, which they dispose of as described in the foregoing. This conveying trough *O* is rigidly connected to the screen *D* so that it has the same conveying motion.

The preparation of nut coal in this plant is accomplished in an unusual manner. This material is delivered from the Marcus to the nut-slack conveyor *E*, directly beneath. This conveyor is made with two compartments, one carrying nut coal and the other slack. The elevator *H* receives the nut coal from one compartment of the conveyor *E* and delivers it to the bin *I* where it is stored, since the quantity is relatively small. When it is desired to ship this nut coal, the nut chute to the loader *L*, Fig. 4, is opened and the loader on the lump track lowers it gently into railroad cars. In passing over the loader *J*, the rescreener *K*, Fig. 1, removes the fine coal made in handling so that an excellent quality of nut is prepared for shipment. This is illustrated by Fig. 6. The "Rands" shaker loaders *J* each consist of an upper and lower section balanced against each other. They possess few wearing parts and because the coal is placed (not dropped) into the railroad cars at a low point they cause a minimum of degradation.

The upper sections do not raise or lower, but the lower, or boom, sections are raised by the electric hoists *T* as the railroad cars fill. Both sections receive a reciprocating motion from a drive shaft actuated by an electric motor.

On account of No. 3 Pocahontas coal being of an extremely friable nature, sections of perforated plate called rescreeners (*K*) were inserted in the upper sections. The coal is thus given a final rescreening in lump, egg and nut sizes just before passing into railroad cars.

All the slack screened from the run-of-mine (also all rescreenings from the nut, egg and lump) is carried by

FIGS. 5 AND 6. KIND OF COAL PREPARED BY PLANT

the conveyor *F* parallel to the lump track and reduced in the crusher *G* to $\frac{3}{8}$ in. for coking.

To deliver slack to the newly acquired Shawnee ovens, the conveyor *R* was built through a concrete tunnel under the railroad tracks and thence on a 30-deg. incline to the 400-ton larry bin *S*, shown in the plan view, Fig. 1. This conveyor *R* handles the $\frac{3}{8}$-in. crushed slack at the rate of 100 tons per hour so that the Shawnee supply can be easily maintained and the balance of the stream of slack diverted to the old plant, as in the past, for reduction in another crusher for use in the original Pulaski ovens.

The entire new plant (including all the units illustrated in Figs. 1 to 4 inclusive) was designed and built by the Roberts & Schaefer Co., engineers and contractors, Chicago, Illinois.

The Briquetting of Anthracite*

By W. P. FREY
Fuel Engineer, Lehigh Coal and Navigation Co., Lansford, Penn.

SYNOPSIS — *Briquetting of anthracite culm or silt, up to a few years ago, was not a financial success. The introduction of the Dutch oil process and certain improvements in equipment have altered this situation. Silt of a proper quality may now be briquetted at a substantial profit.*

THE briquette plant of the Lehigh Coal and Navigation Co., at Lansford, Penn., has been previously described. Fighting its way like the pioneer of early days through trials and discouragements, it has passed the stage of experiment and has become an institution resting on a foundation practically and financially sound. How the goal was reached it is the purpose of this paper to show, and explanation will be made as to why success was easier along the roads finally chosen. An attempt will be made to set standards for the development of hard-coal briquetting that will eliminate future failures.

All conclusions here drawn are based upon actual facts and achievements, and therefore all speculation and theorizing have been avoided. It is hoped that this article will awaken interest that may positively and successfully answer the call of national emergency—the necessity for fuel.

New Method Did Away with Fumes

Up to three years ago, the Lehigh Coal and Navigation Co. made hard-coal briquettes, using coal-tar pitch as a binder. The plant operated with a monthly output of from 300 to 600 tons and was unable to meet its own expenses. Naturally no one was satisfied, especially as the ideal of a smokeless briquette was still unrealized. Then came the Dutch oil process, introduced into this country by the General Briquetting Co., of New York. This process uses a small percentage of heavy petroleum residuum as a binder. This, being liquid, achieved great economy of handling and did away with the fumes.

This oil (called "Hydrolene" 160 deg. melting point) is not absolutely smokeless; in fact, the heating up of a fresh supply of fuel to the temperature of red heat liberates low-volatile hydrocarbons that produce a white smoke. This is, however, not objectionable. On the other hand, this oil adds to the briquette about 7 per cent. of volatile matter, making the product so far as heat content is concerned the equivalent of the best free-burning anthracite coal.

The average silt used in the manufacture of these briquettes, or boulets, averages 16.5 per cent. chemical ash, corresponding to 12,000 B.t.u. per pound of coal. The hydrolene used as a binder runs about 17,500 B.t.u. per pound, and approximately 7 per cent. of it enters into the mixture, hence:

$$12{,}000 \times 0.93 = 11{,}160 \text{ B.t.u.}$$
$$17{,}500 \times 0.07 = 1{,}125 \text{ B.t.u.}$$

Total B.t.u. = 12,385 per pound of briquetted coal.

The gain over the original coal is 385 B.t.u., or, in other words, the net gain in heating value amounts to 3.2 per cent. Thus, the briquetted anthracite averages 12,385 B.t.u. per pound, and contains 12 per cent. volatile matter and 16.5 per cent. chemical ash.

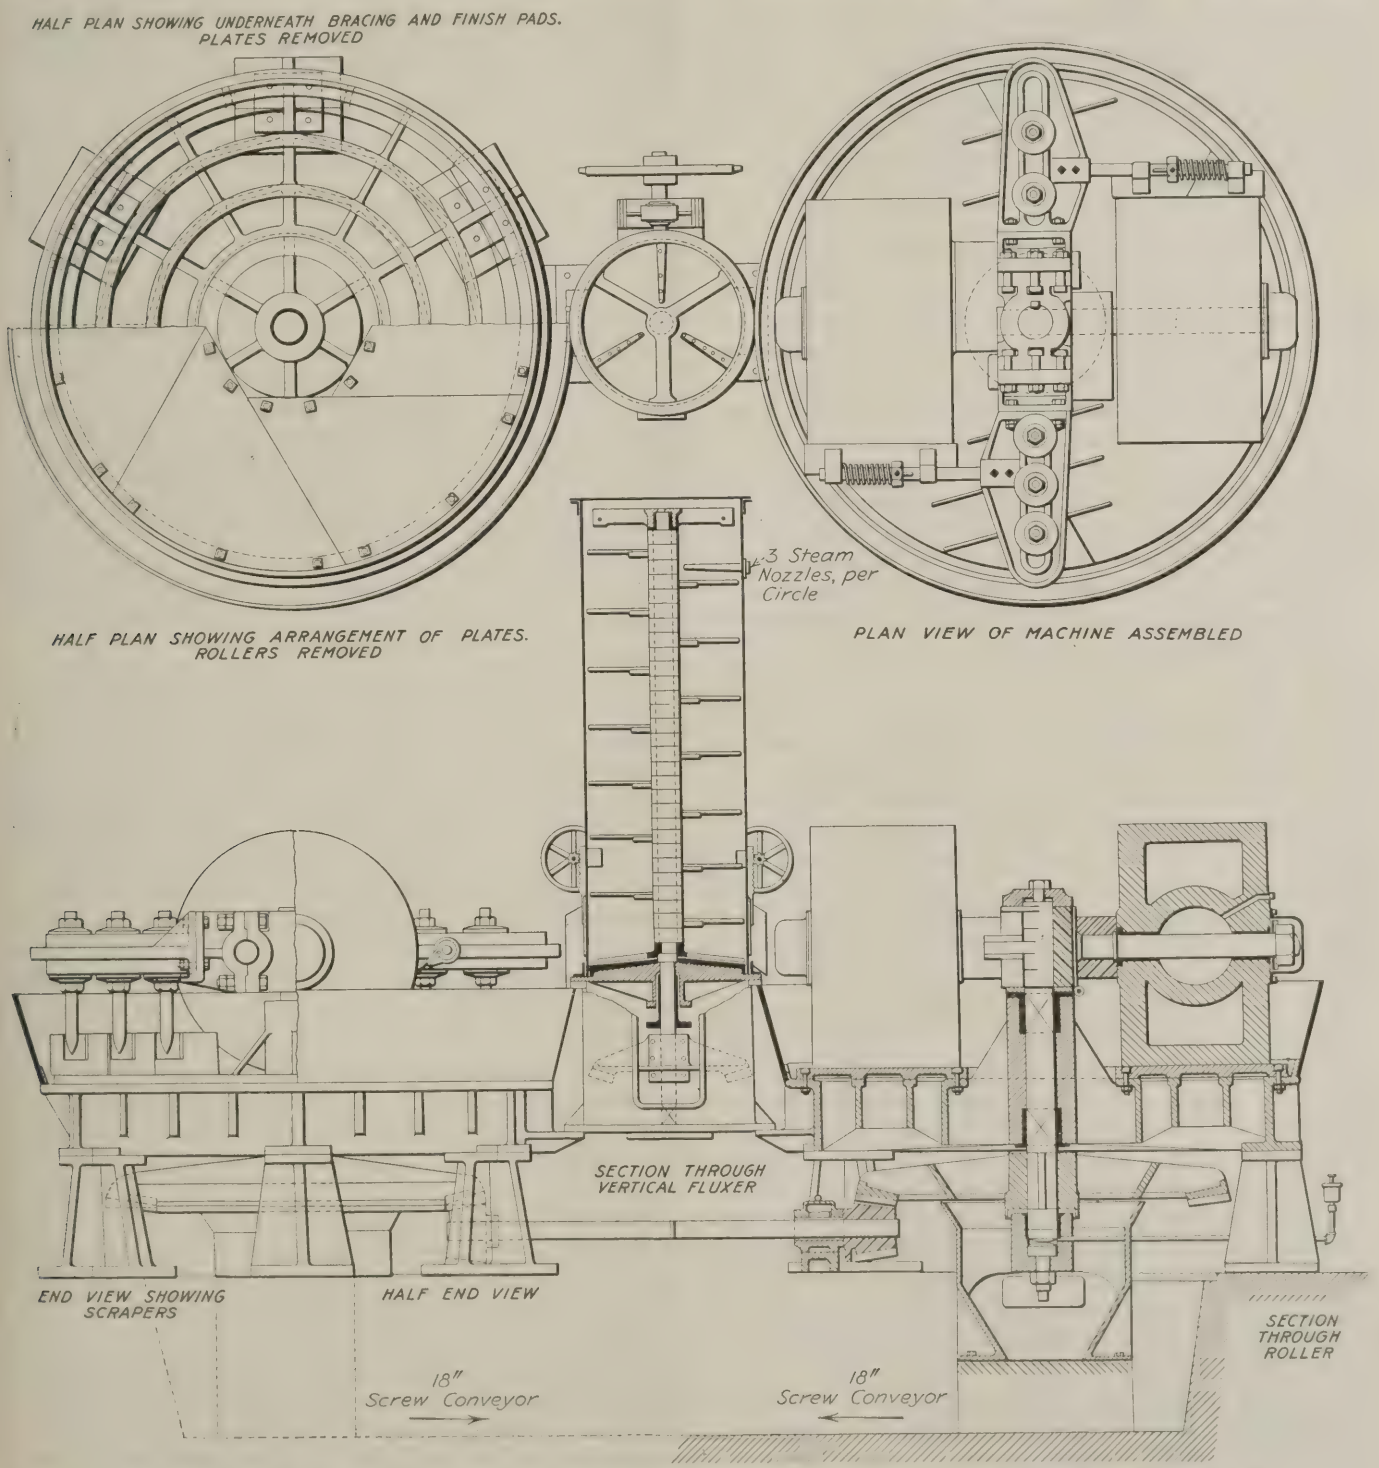
This is a most valuable fuel; it is the best fuel in its adaptations to the requirements of the kitchen range, from the small household to the large hotel, be it for cooking, baking or broiling; it is an excellent fuel for the hot-air furnace and steam boiler; it is a good fuel for general purposes and has successfully replaced, around the mines, the bituminous coal necessary for the operation of certain classes of steam shovels, steam rollers and mine locomotives. It has been tried out on the heavy freight engines of the Lehigh & New England R.R., in narrow, semi-wide and wide fireboxes, and has always shown steaming qualities equal to the best free-burning coal of the same ash content.

Briquettes May Be Mixed with Soft Coal

Of course, even the free-burning coal cannot replace high-grade bituminous in the firing practice of locomotives, but the briquettes may be mixed half and half with such coal, either mechanically by introducing anthracite briquettes into soft coal, or more intimately by briquetting a hard-soft coal mixture. This 50-50 mixture will burn with the same steaming qualities and efficiency of combustion as the original bituminous coal. The mixture can even be compounded in the proportion of 15 per cent. bituminous coal and 85 per cent. briquettes, but in this case the consumption will be greater by 15 to 25 per cent. for the same rating. Several instances could be cited where factory owners, unable to secure coal for their bituminous-coal boilers, had to replace it entirely by anthracite briquettes, and did so without materially increasing their fuel bill.

The anthracite briquette as a fuel does not mix with straight anthracite coal. As is self-evident, the anthracite briquette must be made of a raw material of such low ash content as will prevent clinkering. In general this result will be secured if the ash content is kept below 18 per cent. Emphasis must be laid upon this particular point, as such requirements exclude from direct briquetting most of the large anthracite culm banks now available at the various mines. It is a consideration of prime importance in the successful manufacturing and marketing of this new product. Not until lately has it been possible to develop machinery that will practically and cheaply furnish such silt as is required. The Lehigh Coal and Navigation Co., using a combination of cone separators and shaking tables, has been entirely successful in solving this problem. It is almost unnecessary to add that the briquette made from hard coal and hydrolene is waterproof, tough and hard. This results in minimum breakage in loading and dumping.

The balance of the problem of successful briquetting requires purely mechanical engineering only. The remodeled Lansford plant serves as an illustration. The output of any similar installation is limited by the capacity of the presses. In this case it is 40 tons per



*Paper to be read at the American Institute of Mining Engineers, at its February meeting, New York City.

hour. Forty tons per hour will thus dimension the dumping arrangements, the driers, the mixers and the presses. Much care should be exercised in the choice of a dumping arrangement; it should be light enough to be entirely automatic and heavy enough to stand the wear and tear of the rubbing of the coal and the corrosion of the acid water. It should be arranged to be frostproof, well drained and easily accessible.

The steel dumping hopper is provided with an adjustable gate. The bottom of the hopper is formed by a steel apron feeder, which dumps the coal on a V-bucket elevator. This in turn takes the coal to the top of the drier building and dumps it into steel chutes leading to the two driers. The apron feeder has a speed of 30 ft. per minute. The V-buckets are each 15 x 16 in., rigidly mounted on No. 1112 Link-Belt chain; their speed is 80 ft. per minute.

The two driers are of the rotary single shell type, 36 ft. long and 6 ft. 5 in. in inside diameter. They are pitched ⅜ in. per foot. The number of revolutions is 11 per minute. This arrangement is simple and cheap but has the disadvantage of sending a heavy black cloud of coal particles up the stack. This can only be prevented by dust collectors or incomplete drying. The fuel used for the drier furnace is No. 3 buckwheat. So efficient is the arrangement, that under good conditions 70 tons of culm are dried per ton of coal burned. A screen attachment at the end of the driers removes all oversize and foreign material.

The dried coal is fed directly into two double-strand

BIG CHILEAN MILL MIXER WHERE COAL AND BINDER ARE GROUND INTO INTIMATE CONTACT

continuous bucket elevators with steel casing and 12 x 8 x 12-in. buckets, and delivered to two dry-coal bins of 100 tons capacity each. Sufficient silt is always kept in cars outside of the plant to insure continuity of operation. The contents of the dry bins equalize the dry coal supply to the mixers and presses, and eliminate fluctuations due to time lost in dumping cars or to machinery breakdowns in the drying plant. Fifty horsepower is required to drive the driers and dump.

The culm being now dry, special attention must be paid to the prevention of undue dust. As dry-culm carriers, screw or belt conveyors only may be used, and these must be inclosed in dustproof casings. Both types of conveyors have their advantages and disadvantages. Belts always drop coal on the under side, and provision should be made so that this waste material may easily be removed or recovered without loss of time. Screw conveyors can be used advantageously for either wet or dry silt. Such conveyors, over 100 ft. long, are in use and give little trouble. However, belt conveyors are found preferable because they are lighter, cheaper and faster.

How to Handle the Hot Mixture

From the dry-coal bins the coal should be delivered by the shortest possible route to a mixer, where the hot oil can be thoroughly mixed with it. A preliminary purely mechanical mixing of oil and coal is done in a slightly inclined paddle mixer 3 ft. long. This mixer measures 20 in. over the paddles and its number of revolutions is 75 per minute. The oil is fed in at a temperature of about 250 deg. F. The coal is at a temperature of about 100 deg. The handling of this hot oil and coal mixture presents some difficulties, since in chilling the oil becomes sticky and naturally will adhere to metal as well as to coal. There are different ways to overcome this. At 250 deg. F. the oil will flow like water; at about 70 deg. F. it becomes hard and brittle; at about 175 deg. F. its sticking qualities are most pronounced, while at 135 deg. they disappear. It is necessary, therefore, to either keep the coal and oil mixture at temperatures close to 200 deg. F. or else hold the coal and oil mixture around 150 deg., keeping the shell and metal parts so cool that in contact with them the oil chills immediately to a nonsticking mass. This latter method has been chosen in the Lansford plant, though for reasons of ecomony the mixture should be kept hot, and it is expected to improve this machinery to the point where it will be possible to successfully handle a hot coal-and-oil mixture.

The paddle mixing trough is kept cool by a steady flow of cold water. This water enters into the mixture as surface moisture and then helps make the mass flow more freely. From the short paddle mixer the coal-and-oil mixture is discharged to a vertical paddle mixer, or fluxer, so called because here, in addition to mechanical mixing, a moistening and heating effect is obtained, which brings the mass to the plasticity of a perfect flux, hot enough to be adhesive and moist enough to make handling easy. The flux then passes through the masticator, a Chilean mill of huge dimensions, where a thorough intermixing of ingredients occurs.

The use of the masticator is the backbone of the patents covering the Dutch oil process. It could be eliminated, but the saving in royalty is generally offset by the cost of additional oil necessary. The masticator makes 20 r.p.m. It is built either in single or twin-unit types, local conditions will determine the choice. Twelve and one-half tons of material per hour are efficiently masticated. One hundred horsepower will drive the single-unit type and 150 hp. the twin-unit type of this machine. The masticator discharges centrally through a horizontal 12-in. screw conveyor, operating at 60 r.p.m., to the presses.

The vertical feedbox on top of the press contains a vertical stirrer which keeps the flux in motion, insuring equal and continuous feed. The press shafts should be well dimensioned, as they often break from fatigue. The type of press used in this plant is known as the "Belgian eggette press." The choice of this machine is the result of investigations covering several other types of presses. The peripheral speed of the press rolls is 80 ft. per minute. The die rings are either steel, cut and milled, or chilled cast iron.

The output of each press is now over 10 tons per hour. This increase from four tons to ten (the original guaranteed press output having been four tons per press per hour) was a vital factor in the success of the plant.

As the briquettes leave the press warm, some care has to be taken in handling them until they are sufficiently cooled to become hard. At this plant the boulets drop onto a 24-in. belt conveyor and are taken to a rotary screen, where all waste breakage is removed and sent back to the presses. The boulets leaving the rotary screen are delivered by a single 24-in. belt to a double-strand continuous bucket elevator with 18 x 8 x 12-in. buckets, which in turn discharges into a 300-ton pocket with a perforated screen bottom. Here sufficient time is allowed them to cool before being loaded into cars. During the hot season this cooling process is accelerated by water sprays. Breakage through storing and loading amounts to less than 2 per cent.

Ample Storage Capacity a Necessity

The handling of the oil requires special steam-heated installations. As the oil is a manufactured product, provisions should be made for ample storage capacity, amounting to at least a two-weeks' supply. Any kind of insulated tank will answer the requirements, provided there is a good nonleaking radiator arrangement with a temperature control. Oil should not be kept too hot or its melting point will rise due to evaporation of its volatile constituents. A 70,000-gal. tank is being used at Lansford, as the main storage unit, with the oil at 180 deg. F. A 12,000-gal. tank is employed for direct use, with the oil at 275 deg. F. A steam-heated, electrically driven Kinney pump maintains circulation in the oil system and has satisfactorily answered all purposes. It has been in continuous service for over two years.

Generally speaking, all oil lines have to be steam-heated. This is done by running 1-in. steam lines beside the oil lines (not smaller than 2 in.) and wrapping the two together with good insulating material. Only quick-closing gate valves should be used. In order to have a uniform flow of oil, an overflow feeder tank is provided where the mixing of coal and oil is performed. By keeping the tank full constant head is obtained. A steam-heated gate valve will give the necessary adjustment facilities. Much attention has to be paid to the

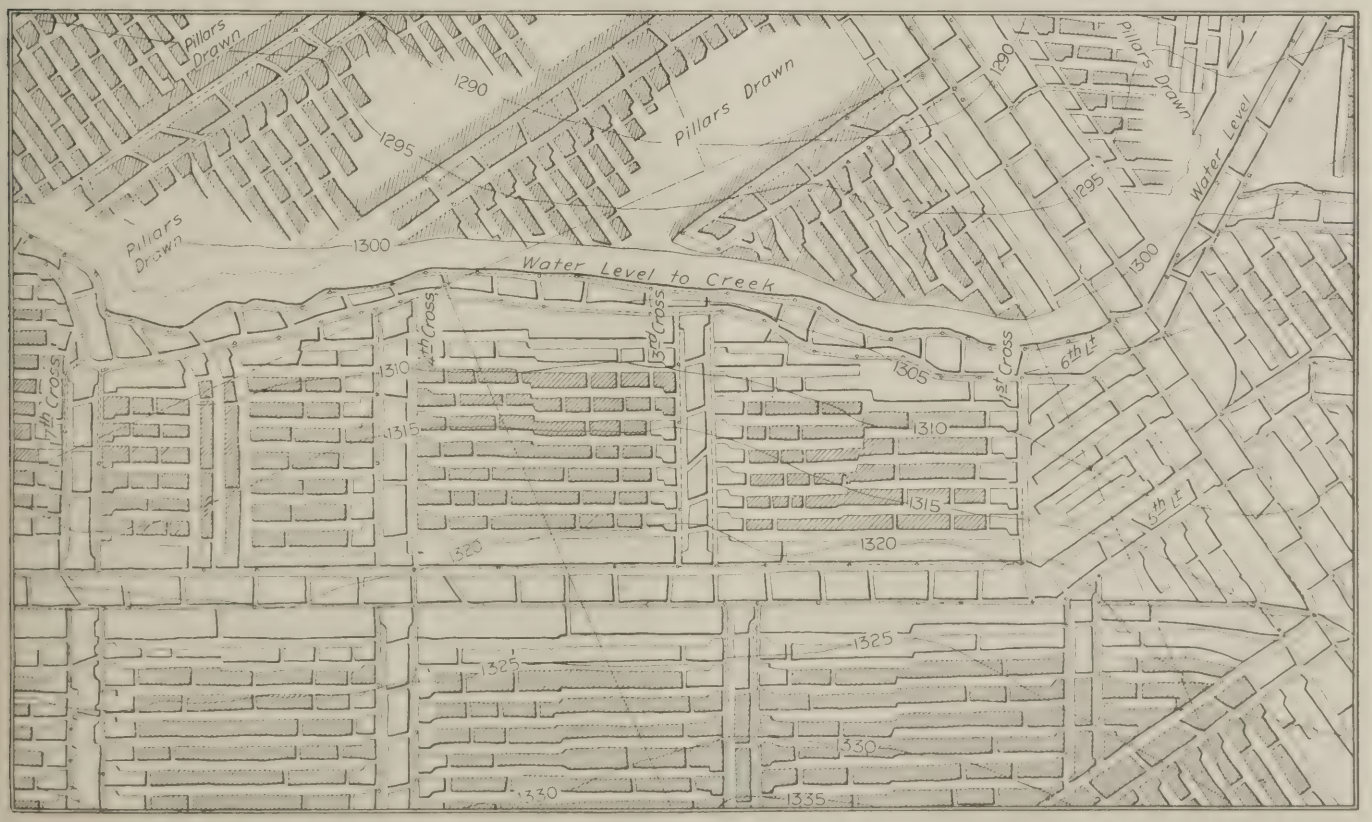
good working of this outfit, as the cost of oil is the biggest single item entering into the manufacturing cost of boulets.

At the present market prices and wage scales, the following cost statement applies to the manufacture of hard coal briquettes per ton:

Oil binder	$1.25	Depreciation	$0.20
Clean silt delivered at plant	1.00	Insurance, compensation and taxes	.05
Superintendence and labor	.40	Royalty	.10
Power, light, heat and water	.15		
Supplies	.05		
Maintenance	.05	Total cost per ton	$3.35
Interest on investment	.10		

These figures, though conservative, will give ample protection to the prospective manufacturer. A plant such as this represents at the present market prices an investment of $250,000, exclusive of ground and tracks. The boulets find a ready market at $4 per ton, leaving a comfortable margin of profit available.

Unusual Method of Drainage



At one of the mines of a large coal company in central Pennsylvania the main slope was driven from the highest point on the outcrop of the coal instead of the lowest, as is usually the case. The point at which the opening was made was selected because it was nearest to the railroad which controlled the mine, while the lowest point, where the coal outcropped on the property, was on another railroad four miles away. Even if the mine had been opened at the lowest point about one-half of the operation would have been below the drainage level. After operating the mine for a number of years, the quantity of water handled by the pumps, particularly during the spring, became so great that some other method of drainage had to be devised.

It was known from the outcrop survey that the lowest point on the outcrop was about 100 ft. below the slope opening. A drift was started here. The main slope was extended until it reached the level of the new drift opened from the outside. Two drifts on this level were then started from the main slope, one to the right and the other to the left. These drifts and similar drifts at three other slopes in adjoining mines of the same company were then driven, the floor being kept level. These drifts were driven until they joined, making a water level connecting all four mines draining to the outside. Practically all this work was in virgin coal. A pillar of solid coal, 100 ft. thick, was left on the lower side of the water level, the only breaks in the pillar occurring where the main slopes from the mines pass through it.

Later it was found that there were some parts of the water level that had bad roof and the upkeep of which was too expensive. These places were lined with concrete, and in some cases rock tunnels were driven. As the workings of the mine progressed, cross-entries were driven on the upper side of the water level to connect these workings with the water level.

Most of the coal has now been taken out from the upper side of the water level and almost all of the workings are below it. All of the worked-out portion of the mine is drained into this water level, and in normal weather a stream of water that would fill a 24-in. pipe flows through it. In rainy seasons the water is 3 ft. deep. A part of this water level is shown by the heavy lines in the mine map below.

The main slope has now been driven in 2½ miles, and the same system is now being installed to drain all the water between this new water level and the upper water level. Instead of being drained to the outside, the water is carried to a pump and from there it is pumped to the surface by three 600-gal. Morris centrifugal pumps.

MINE MAP, SHOWING WATER LEVEL AND DETAILS OF DRAINAGE METHOD

Efficient Coal-Mine Gatehouse

By R. M. MAGRAW
General Superintendent, Utah Fuel Co., Hiawatha, Utah

THE foreword in the Dec. 8, 1917, issue of *Coal Age*, "The Coal-Mine Gatehouse," appeals with peculiar force to me, as undoubtedly it does to many others of the coal-mining fraternity who have had experience at mines where the gatehouse, or check cabin, was considered an unnecessary luxury or bill of expense. Many companies claiming to have efficient checking systems have overlooked the salient features which the name usually denotes.

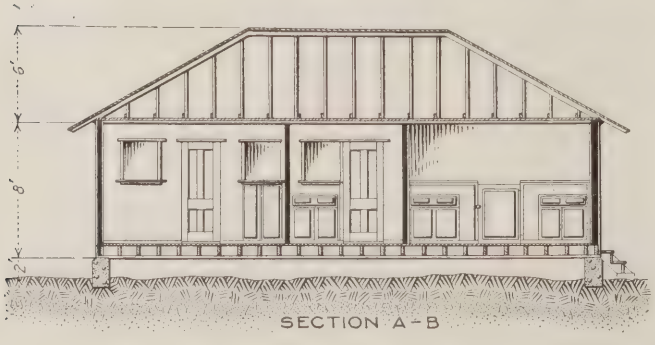
The mere fact that the employee is required to hang a check on the board when entering the mine and to remove it when coming out does not spell that state of preparedness and efficiency mentioned by the editor in the last paragraph of the foreword mentioned above, as such a practice only serves to indicate the number of men in the mine and does not follow out the main objects of a checking system as they are contemplated by the editor.

Where a single check is hung on the board at the beginning of the shift and removed at the quitting time of the individual, the system breaks down, to quote the foreword, "in that day of disaster which every mine operator hopes he'll never see," in that it cannot be of assistance in identifying the unfortunates.

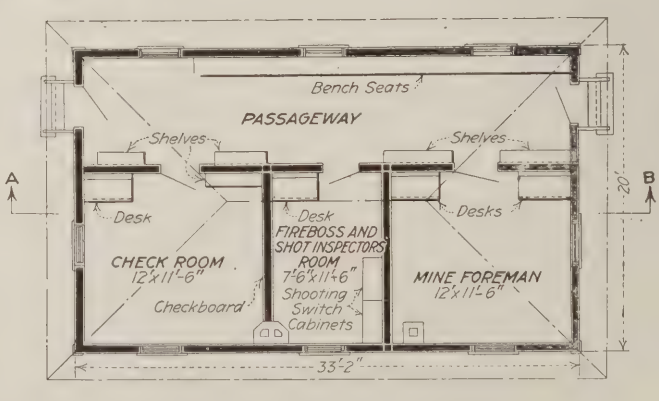
I have seen some very elaborate checking systems where celluloid checks of different colors were used to segregate the labor into classes. The complications arising from too much system, however, and the inflammability of the celluloid itself, detract from the value of such installations.

The effectiveness of any checking system is governed by its addition to the safety of the employees, to the efficiency of the organization, to the ease and economy of its operation, and to the value of the information which is compiled from the records of the checkman.

Gatehouses can be made as expensive as the resources of the company will permit. They can also be economical of construction and at the same time embody most of the essential features of the more costly installations. Such a structure, as standardized at the mines of the United States Fuel Co., at Hiawatha, Black Hawk, Mohrland and Panther, Utah, will be described. The building itself is of no particular interest, except to show that a satisfactory arrangement can be secured at moderate cost; but it is believed that a description of the system involved may prove of value.



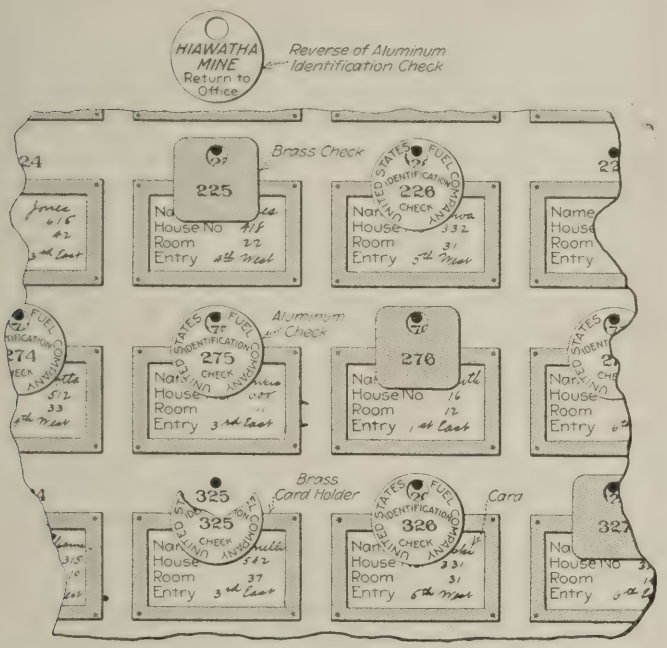
The building is of frame and galvanized-iron construction, and a glance at the accompanying floor plan (Fig. 1) will serve to show the arrangement of the interior. The building is located about 20 ft. from, and to one side of, the manway entrance to the mine, so that in case of a disaster it would be in the clear.



The employee enters at the end of the building farthest from the mine, passes by the office of the mine foreman, who, if necessary, issues instructions relative to the day's work, care of working place, etc.; then by the fireboss' window, where the condition of his working place as regards safety is given him, as are also any instructions relative to immediate safety precautions; then finally past the check window, where he has delivered to him a circular aluminum check bearing his number, which he is required to carry at all times while in the mine. A square brass check, containing the same number, is hung over his space on the checkboard at all times as long as he remains in the employ of the company. When he leaves the mine he returns his aluminum check, which is hung over the brass check.

This system shows the checkman, foreman or other officials at a glance the number of men working and the number idle, and at the end of the shift the board shows the men who have checked out and those still remaining in the mine.

It being a strict rule that no shots shall be fired while men are in the mine, all the shots being fired electrically by a switch located in the check cabin, the checkboard is a necessary feature. If John Jones, or, as it is more apt to be, John Pappadametropopoulos, goes home without delivering his check it is up to the shotfirer to locate him before throwing the shooting switch. Formerly it took an hour or more to locate him, due to his proclivity to change his domicile without leaving any forwarding address. The fact that he was charged a dollar for his forgetfulness, which went to a fund to furnish the children of the camp with a treat on the Fourth of July, did not pay for the loss of time and efficiency.



It very often happened that a telegram or other urgent message would come for a man while he was in the mine. It was difficult to remember just where he was working, and occasionally valuable time was lost in finding him.

PLANS OF STANDARD CHECK CABIN OF THE UNITED STATES FUEL CO., HIAWATHA, UTAH

In order to make it easy to locate a man either in or out of the mine, a card system has been inaugurated, which has in a large measure solved the difficulty. Under each check number a brass cardholder has been tacked in which is fastened a card 1½ x 2½ in. The card is given to the man at the office, where he signs an application and gets a check number, and contains his name, occupation, residence and working place. This is of great assistance to the foreman, boss driver and

PORTION OF UNITED STATES FUEL CO.'S CHECKBOARD

others, as at a glance the number and location of idle places can be determined, and the day's campaign laid out accordingly.

The wall space in the passageway is used for hanging miners' coal checks, for posting safety-first signs, bulletins, etc.

The checkman is paid by the month, and in addition to his duties as checkman he issues powder to the miners before they enter the mine. After all men have checked in, the checkman takes a tally of the board, noting in a record book the number of loaders, pick miners, machinemen, drivers and other classes of labor at work that day. Each individual is entered separately, and at the time he checks out the number of hours worked is entered.

Anthracite Operators Take Hold

The following circular notice was issued Feb. 4, by the General Committee of Anthracite Operators, Lafayette Building, Philadelphia:

A special representative committee was appointed Feb. 1 by the anthracite industry to work out and give effect to a constructive program for the increased production and more equitable distribution of coal. It held its first meeting in Philadelphia today. The committee consists of Joseph B. Dickson, of Dickson and Eddy, New York; W. J. Richards, president, Philadelphia & Reading Coal and Iron Co.; S. D. Warriner, president, Lehigh Coal and Navigation Company.

What is being attempted is done with the knowledge and approval of the Federal Fuel Administration. The anthracite operators are coöperating with the Fuel Administration and the Government authorities in every way possible in the hope of meeting the difficulties of the current situation, and they are looking ahead to prevent similar trouble next winter.

A plan has been roughly outlined and adopted and it will now be worked out in the detail necessary to make it practically effective. It aims to establish a central organization through which a complete coöperation of all anthracite producers may be obtained. This will coördinate with the Federal Fuel Administration and the Director General of Railroads, the purpose being to accomplish the following ends:

1. To provide an increased production of anthracite.
2. To take such measures as may be necessary to maintain the standard of the coal produced and to restrict the sale of any output unsuited for economic use.
3. To prevent the substitution of bituminous coal and coke by anthracite, which substitution cuts down the available supply of anthracite to anthracite consumers.
4. To catalog the war requirements of the Government for anthracite.
5. To determine the needs of the consuming public throughout the territory in which anthracite is normally used.
6. To apportion the output of anthracite by districts, cities and towns, to the end that each shall be assured of its fair supply.
7. To route the anthracite from points of production to points of consumption by traffic lines that will afford distribution on the quickest and most economic basis.

The above forward-looking plan cannot be given full effect immediately. But while it is hardly possible to have it completely operative before Apr. 1, the purpose is to get it working as fast as possible, and in the meantime to meet the general need and specific needs so as to afford the greatest relief.

The committee of three is getting the data necessary for the practical working of the plan. It will be perfected in detail and submitted to the Federal Fuel Administrator as quickly as possible. It is expected that the adjustments made will cause a material increase in output and a better distribution of anthracite. When the coal gets to points of consumption it will be for the local fuel administrators to see that it is equitably distributed and not wasted or diverted into channels not intended. When the coal reaches the retailer the operators, as producers and wholesalers, have no control over it.

Why Concrete Tanks Fail

Old chain, wire rope and like materials are unsuited to tank reinforcement as they cannot accurately be placed in the forms nor kept in proper position while placing concrete. However strong such reinforcing material may be in itself, says "The Ransome Book," the effectiveness of it is not secured when used in reinforced-concrete tanks or similar structures. For small concrete tanks mesh fabric may be used, but large tanks require suitable sizes of steel rods and bars. Tanks which are made from concrete lean in cement, or from ill-proportioned mixtures or which are made from concrete placed either too wet or too dry are apt to be leaky. If the newly placed concrete is not protected from drying prematurely, the result is similar.

Coming Meetings

American Institute of Mining Engineers will hold its annual New York meeting Feb. 18 to 21, in the rooms of the society, 29 West 39th St. Secretary, Bradley Stoughton, New York.

American Society of Mechanical Engineers will hold its spring meeting June 4 to 7. Secretary, Calvin W. Rice, 29 West 39th Street.

Canadian Institute of Mining Engineers' annual meeting will be held Mar. 6 in Montreal, Canada. Secretary, H. M. Lamb, 503 Drummond Building, Montreal, Canada.

Economical Generation of Thermal Power at Coal Mines—III

By JOHN B. C. KERSHAW
9 Grosvenor Road, Colwyn Bay, North Wales

SYNOPSIS—*The type of boiler to be employed in a mine power plant should be decided upon after careful consideration. Both the internally fired and the water-tube types have their advantages. The adoption of hand-firing or the employment of mechanical stokers depends largely upon the skill of the available help.*

REFERRING again to the subject of the air mechanically retained in feed water, it may be pointed out that the presence of this impurity is sometimes due to the faulty packing of the feed-pump barrel. The best remedy for this evil is to repack the barrel, and if this fails, to raise the feed-water supply tank to a higher level and thus reduce the lift on the pump as much as possible. The delivery of the feed water inside the boiler should also be made within the steam space, and not below the water level, since in the latter case the mechanically held air will be diffused through the water contents of the boiler and will have time to effect considerable harm before its escape with the steam.

As regards chlorides, it is advisable not to use a water containing this impurity in any considerable amount; but if such use be unavoidable, it is well to clamp zinc plates inside the boiler shell at suitable points and to renew these as frequently as they are dissolved by the action of the chlorine upon them.

Boilers and Furnaces

In this section of my article I am not going to advocate the use of any particular boiler or furnace, but only to indicate the scientific basis upon which the choice of these for mining power plants ought to rest. The best types of boilers and furnaces for burning particular classes of coal will be indicated, but mine owners and engineers will be left to make their own selection among the various makers and manufacturers of the design recommended.

The fundamental requirements of a good boiler are that it shall produce a maximum quantity of dry steam with the consumption of a minimum amount of fuel, and that it shall also possess some reserve of steaming power. For coal-mining plants which intend to make use of good lump or well-graded small coal, the choice lies between the large shell type of boiler, such as the Lancashire, horizontal multitubular marine, and the large water-tube boiler.

The advantages of the former over the latter type are that its much larger water contents contain a big reserve of heat units, and that it can respond to a sudden demand for steam without much forcing or loss of pressure. It can also be used with a hard water supply, with less risk to the boiler than the water-tube type, since the cleaning of plates from scale is more easily carried out than the cleaning of partially stopped-up tubes.

The disadvantages of the Lancashire shell type of boiler are its water-cooled furnace, which sometimes leads to incomplete combustion and smoke production with highly bituminous fuels, and its poor circulation, which leads to a low steam-raising capacity for the volume of water contained. The former disadvantage can be overcome by the use of a preheated air supply and artificial draft, while the latter defect can be remedied by any of the well known devices for displacing the water from those pockets and corners where no movement occurs naturally. With these improvements in its methods of working, the Lancashire type of boiler is one of the most reliable for colliery work, with ordinary well-screened slack or coal testing up to 12.5 to 15 per cent. ash. In the United Kingdom it is the one most generally employed for coal-mining power plants.

It is quite a mistake to suppose that bituminous fuel testing up to 35 per cent. volatile matter cannot be burned in these boilers without excessive smoke production, for with proper regulation of the air supply and some arrangement for admitting secondary preheated air at the bridge or through the furnace door, during the period of maximum evolution of the hydrocarbon gases, high efficiencies and smokeless combustion are possible. There are many of these air-regulating devices on the market, and Fig. 1 shows one that has been operated with success in the Manchester district of Lancashire.

The Lancashire shell type of boiler, however, is not adapted for burning low-grade fuels with high ash contents, since these demand some form of brick-lined combustion chamber and mechanical ash-handling equipment for their satisfactory combustion. The comparatively restricted furnace and ash space of the Lancashire boiler is inadequate for these additions. When low-grade fuels, either in the dust or lump form, are to be burned, therefore, the large water-tube boiler must be adopted.

In large plants where the power demand is considerable and a battery of 10 to 20 boilers is required it is the wisest course to install boilers of each type, so that the plant, regarded as a whole, may possess the special advantages of each. The battery of Lancashire boilers would thus be fired with the better classes of fuel, either by hand or by mechanically operated stokers, and would be relied upon to provide the main steam supply and to take any bad feed water that came along. The water-tube boilers, on the other hand, would be operated with mechanical stokers and the poorer classes of fuel, and would provide steam for the periods of exceptional activity.

In very large plants a Bettington vertical tubular boiler might also be included, in order to make use of the fine coal dust which collects on the floors and ledges of the mines. This would only require drying in order

to yield a fuel of high calorific value, and its removal from underground would increase the safety of the operation. The dust from a large number of mines would be required, however, to keep one of these boilers in constant operation, and its installation is only suggested where the conditions warrant the expenditure.

As regards the method of gasifying poor fuels, described in Article I of this series, either type of boiler can be adapted for gas firing, but the form of burner employed must be different in the two cases. A long conical luminous flame is required in the Lancashire type of boiler and a spreading nonluminous diffused flame in the water-tube boiler. The difference is due to the fact that in the former case the greater portion of the heat which is transferred to the water passes through the plates of the boiler chiefly by direct radiation from the flame itself, while in the latter case the brickwork is the chief source of radiated heat. With suitable burners and baffling arrangements, however, high efficiencies up to 70 per cent. and over are attainable with gas heating, and if the Boncourt system of flameless combustion be used, still higher efficiencies are possible.

The Design and Setting of Boilers

The general conditions which must be observed in the design and setting of either type of boiler, if high efficiencies are to be obtained, are the following:

a. The furnace grate and combustion chamber of the boiler must be adapted to the physical and chemical characteristics of the fuel to be burned, and the heated gases should not be allowed to come into contact with the water-cooled plates or tubes, before perfect combustion has been attained.

b. The plates or tubes which are in contact with the water on the one side and with the hot gases on the other should be of ample superficial area to raise the steam required under normal conditions from each boiler without undue forcing of the fires, and the internal design should be such that the discovery of any corrosion or cracks may be made easy during the periodic inspections.

c. All portions of the heating surfaces exposed to radiation or contact with the hot flame and gases should be constantly covered with water, and the accumulation of scale on these surfaces should never be allowed to exceed $\frac{1}{8}$ in. in thickness.

d. The circulation of the water in boilers of the internally-fired Lancashire type should be promoted by some mechanical means at the dead points, notably underneath the ash boxes.

e. The side and end flues of the boiler should be provided with mechanical scrapers in order that flue dust may be regularly removed without interfering with the work of the boiler. Poor draft, especially when burning low-grade fuels, is often caused by the blocking of the flues with dust which ought never have been allowed to accumulate. The poorer the fuel the more frequent should be the cleaning of the flues.

f. In water-tube boilers the arrangement and number of the baffles have great effect upon the efficiency, and it is a mistake to assume that one fixed arrangement of the baffles is the best for all classes of fuel. The experiments of Henry Kreisinger and W. T. Ray upon "The Adaptation of Boiler Furnaces to Available Fuels" prove that there is great scope for improvement in this direction in the majority of existing water-tube boilers. This paper appeared in the *Journal of the Western Society of Engineers* for November, 1913.

g. The outer brickwork of the boiler setting should be air-tight, since the infiltration of air into the flues through faulty bricks and cracked joints not only spoils the draft, but leads to large heat losses. It is well to build the outside walls with a 3-in. air space inclosed between the two thicknesses of brickwork, and to paint

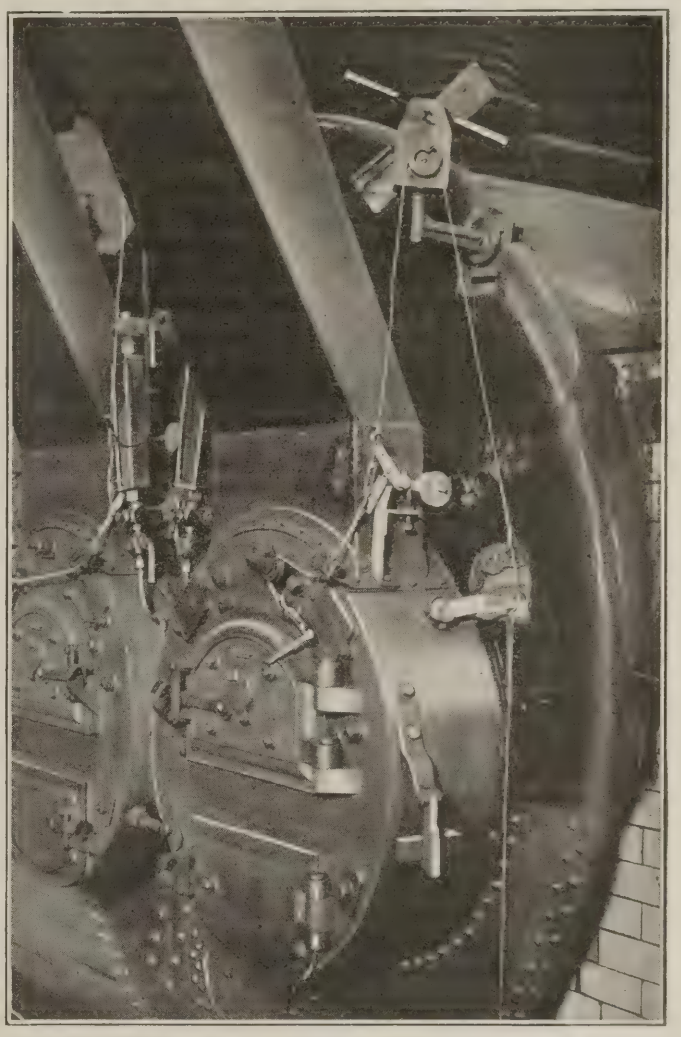


FIG. 1. MILLS AUTOMATIC ARRANGEMENT
For controlling primary and secondary air supply to a Lancashire boiler 8 x 30 ft., fitted with forced draft

or tar the outer wall at frequent intervals, in order to close all cracks and joints. In some cases sheets of asbestos or iron plate have been built into the wall for the purpose of rendering the brickwork air-tight. The boilers at the new Ashley St. Station, New York, described in *Power* for Oct. 9, 1917, are an example of good construction in this respect.

h. The exposed portions of the boiler shell and main steam pipes should be covered with a thick layer of some good heat-insulating material, in order to reduce convection and radiation losses. The spongy substance obtained by blowing air through slag as it solidifies, and known as "silicated cotton" or "slag wool," is one of the best materials for this purpose. I have been on the top of a battery of 8 x 30-ft. Lancashire boilers covered with this material, where it was cool enough to spend an hour without any discomfort from excessive heat.

The heat lost by radiation from uncovered boilers, especially when they are unprotected from atmospheric influences, is far greater than is suspected.

The diagram, Fig. 2, shows that under normal good conditions over one-fourth, or 27 per cent., of the heat of the fuel consumed in boiler furnaces is lost either by radiation or with the waste gases. It is wise, therefore, to take all possible precautions when installing boilers to reduce these two items of loss to a minimum. The fuel saved by even a 5 per cent. reduction of these losses would speedily pay for the better material or skill put into this work.

The methods of checking and controlling the work of the boilers will be dealt with in the last article of this series, when the losses in the waste gases will be more closely examined.

The three essentials required for good combustion and high efficiency in the burning of fuel are: (a) A sufficiency but not a great excess of air; (b) a thorough admixture of this air with the volatile hydrocarbon gases produced when the fuel is heated; (c) a temperature sufficiently high to cause the ignition and complete combustion of this hydrocarbon gas and air mixture.

The poor evaporative results obtained in many steam-boiler plants are due to the utter failure to maintain

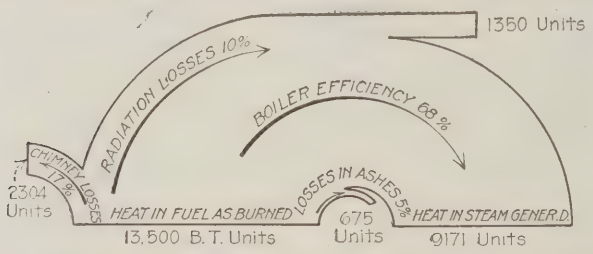

FIG. 2. DIAGRAM SHOWING HEAT LOST BY RADIATION OR WITH THE WASTE GASES

one or more of these three conditions of good combustion, and this failure is quite as often due to faulty design of the furnace and combustion chamber of the boiler as to want of skill on the part of the fireman.

Thus condition (a) demands mechanism or apparatus for controlling and regulating the air supply, condition (b) requires means for mixing the air and volatile hydrocarbons, and (c) necessitates the provision of combustion chambers in which the burning of the hydrocarbon gases can be completed before they come into contact with the water-cooled surfaces of the boiler. No fireman, however skilled, can obtain good results from boilers which are not provided with these requirements.

Considering, first, hand-fired furnaces, these as usually planned and operated fail as regards conditions (a) and (b), for it is evident that the opening of the furnace door for charging fresh fuel, or for cleaning the fires, must allow large volumes of cold air to pass through the furnace, thus abstracting much heat from the fires and plates of the boiler, with no useful result. No hand-fired boiler ought therefore to be started up without an automatic connection between the furnace doors and the dampers, so that when the firing door is opened the appropriate damper is closed (or nearly closed) and the draft through that particular furnace is cut off or considerably checked. The system known as the "balanced draft" system of working boilers attains this end by other means.

Such an arrangement is simple to install and easily maintained in working order, yet one seldom finds hand-fired boilers provided with it.

Again, in hand-fired furnaces there ought to be means provided for varying the air supply at different stages of the combustion process, for a furnace which has just received a charge of solid fuel and is filled with hydrocarbon gases demands more air than one which contains only glowing coke and cinders. The automatic arrangement shown in Fig. 1 is designed to meet this need. As already stated, other forms of regulating devices have been brought out, but are seldom used; yet no hand-fired boiler ought to be allowed to work without one or another of these attachments.

The best types of furnace for hand-fired boilers are provided with closed ash pits; with the mechanical or automatic devices described above for regulating the air-supply; and with means for providing a controlled supply of preheated air at the bridge or end wall of the furnace, for use during the periods of maximum evolution of hydrocarbon gases. The length of each furnace should not exceed 6 ft., or its width 3 ft., since this is the limit of size which one man can cover with fuel by aid of a shovel, in a reasonable time.

Air Leakage Should Be Guarded Against

The corners of the grate on each side of the door should be fitted with nearly straight firebars, giving very slight air apertures between them, since it is in these corners that much air leakage into the furnace may ordinarily occur, with bad effects upon the efficiency. The superficial grate area and depth of fuel bed must be adapted to the fuel burned. It is a mistake to assume that the conditions which suit one fuel are also the best for another of different composition and physical structure. The rate of combustion and depth of fuel bed which will give the best results under given conditions of draft can only be ascertained by actual trial. The average figures of 15 lb. of fuel per square foot of grate area per hour, with a fuel bed 8 in. thick and a draft equal to $\frac{1}{2}$ in. water gage behind the fire, may be widely departed from in practice.

In small power plants any hand-fired boiler equipped as described above and placed under the charge of a well-trained man can show quite as high efficiencies as any type of mechanically operated furnace. It is only where larger boiler installations are concerned, or when low-grade fuels are to be burned, with the production of large amounts of clinker and ash, that mechanical stokers show any economic or other advantage.

Considering now the maintenance of the three essentials of good combustion in mechanically operated boiler furnaces, it is evident that with a regular and constant fuel feed and no opening of the furnace doors for firing or cleaning purposes, the regulation and control of the air supply becomes much simplified. The maintenance of condition (a) of good combustion is therefore provided for in all the best-known types of mechanical stoker, but conditions (b) and (c) are not always observed, especially when burning fuels which evolve large amounts of combustible gases.

Brick-lined combustion chambers which store up heat and assist by radiation in maintaining a high temperature in the furnace are particularly useful in such cases. A large amount of heat is absorbed when these

gases are being evolved from the freshly charged fuel, and unless this can be supplied from the furnace walls the fires are damped down every time fresh fuel is spread over them.

On account of the restricted size of the furnaces and flues the provision of refractory lined combustion chambers is not possible in the Lancashire type of boiler. In this respect it is at a disadvantage when compared with the water-tube and other boilers possessing an independent furnace and grate. In many instances, however, the combustion chamber of these boilers, as originally planned and erected, could be enlarged with advantage, and the raising of the boiler shells and tubes on their supporting framework 18 to 24 in. has often led to a considerable increase in the efficiency of the boiler.

As regards the methods for attaining a thorough admixture of the air and volatile hydrocarbon gases, mechanically operated stoking appliances and steam jets, hot-air jets and "baffling" are the devices employed.

The use of steam jets is the most popular, but unless carefully controlled these jets consume much more steam than is suspected and lead to considerable losses of heat in the chimney gases. Steam consumptions of from 4 to 8 per cent. of the total steam generated are quite common with these aids to more perfect combustion. The steam also has an erosive action on the jets, so that these are continually passing more steam than they were designed for.

A small pump to provide hot air and arrangements for forcing this air under pressure into the combustion chamber at selected points, in order to produce whirling and eddying effects upon the burning gases, is the better method of aiding the chemical changes in the combustion chamber. If this plan be combined with the skillful use of "baffles," the efficiency of the furnace will be raised to its maximum point. As already stated, striking effects can be obtained in some cases by altering the number and arrangement of the baffles in water-tube boilers.

The best method of baffling, however, can only be found by actual trials with the selected fuel; and no one arrangement of the baffles will suit all classes of fuel.

Finally, it may be pointed out with respect to mechanically operated furnaces that it is a mistake to assume, as is often done, that when once the best rate of fuel feed and speed of travel of the fuel along the grate has been determined for any particular grade of fuel the boiler can be left in charge of common laborers or unskilled men. The lesson taught by experience is that mechanical stokers demand skilled supervision and management if they are to yield their highest results. The economic gain resulting from their use lies chiefly in the fact that one skilled operator can attend to double or treble the number of boilers he could attend to if these were hand-fired.

The labor costs are therefore considerably reduced, but this saving is often balanced by the interest charges on the capital represented by, and upkeep charges upon, the mechanical portions of the plant.

In those places and mining districts, therefore, where there are plenty of intelligent men available who can be trained to make good firemen, it is perhaps unwise to install mechanical stokers, unless the other circumstances of the case render their adoption unavoidable.

(To be concluded)

Minecdotes

In Which Mine Bookkeepers Find an Unexpected Ally

"If you would really like to be of some use in the world, instead of merely occupying space," the mine boss said to the master mechanic in one of their numerous arguments, "you might invent an automatic mine bookkeeper and thus relieve the coal industry of one of its necessary nuisances."

"He wouldn't let me overdraw, either," replied the master mechanic.

"You're off on the wrong foot as usual," answered the mine boss, with a flush however that indicated the insinuation was perhaps, not altogether, amiss. "What gets my goat is the way a bookkeeper can take a deadwork report, a few cars of coal and some material orders, and jumble them up so it would take a man a week and two adding machines to figure out whether he ought to buy bonds or strike somebody for a loan."

"Did you ever keep books at a mine?" asked the master mechanic.

"No, I never did," replied the mine boss disgustedly.

"Well, if you ever tried it you would change your tune. The reason why I know is that one time, when the bookkeeper at old No. 12 got sick, I had to fill in; and believe me, I'll take mine in the shop. I would start in the morning posting the ledger, and would no sooner get my pencil sharpened than the 'phone would ring. I'd answer that. Then the boss would want to know the price of spikes somewhere back in 1887, and I'd look that up. The material clerk would butt in and want the waybill reference on a car of props that was lost between here and California. I'd dig that up. By the time I had done a hundred-or-so chores for every idiot who took a notion to come in, I had spent most of the time hunting for my place after the last interruption. I'd get through after awhile, somehow, and then take off my balance; and about the time I'd get halfway down a long column of figures some sucker would breeze in and say, 'Well, ol' timer, how do you like it as far as you've gone?'

"Then, in the afternoon, all the loafers in camp would come in to get store orders and argue about their accounts. Some gink would say he wanted an order and had $26.43 coming to him. His balance would show $26.13. I'd check his account back with him, and show him his error, after which he would shrug his shoulders as much as to say that he knew you were beating him out of 30c., but that he was too much of a gentleman to accuse you of it. I'd then start to give him the $26.13, when he'd say he only wanted 75c. anyhow. Finally, after I'd got worked up to where I'd determined to lick the next fellow who said beans, the whistle would blow, and I'd knock off to do the very same thing all over again the next day. No, sir; a mine bookkeeper earns all he ever gets and generally a whole lot more. There's only one thing about the job that has any advantage in it. After the bookkeeper got well and I went back to the shop, my wife told me that it was the first time I'd had my hands really clean in seven years!"

A Stripping Retrospect

IN THE early seventies, a superintendent of two collieries in the Hazleton anthracite region of Pennsylvania, learning of an interesting experiment in the Wyoming field, visited the operation to obtain further information in regard to it. At that time it was a decided innovation to remove the cover from a coal seam and mine the coal in the open. In a very primitive and limited way this was being done on the outcrop of a coal seam "somewhere in the Northern anthracite field."

This superintendent made a favorable report to his people, and as a result stripping operations shortly afterward were commenced at Milnesville, on the lease of the Stout Coal Co., a few miles north of Hazleton.

OLD NO. 6 COLLIERY OF A. PARDEE & CO., HAZLETON, PENN.

Quite a large area of flat Mammoth coal, with only about 10 to 20 ft. of cover, eventually was mined in the open. The stripping attracted considerable attention and various were the comments in regard to it—some even holding it up to ridicule.

In the light of present-day practice, when this method of mining contributes such a large tonnage in most of the coal states, it seems hardly credible or creditable that it should have had such adverse criticism in its early days. However, its advantages soon were so evident that other Lehigh operators began to strip coal, and the unsightly dirt banks and excavations, so characteristic of this region, began to disfigure the landscape.

Shortly after stripping was under way at Milnesville, a colliery was opened up at Hollywood, an adjoining lease. Here considerable work of this kind was carried on as the Mammoth seam "spooned out" on this property and lent itself especially to this method of mining. H. M. Chance covers the Hollywood strippings at length in Vol. AC of the Pennsylvania Second Geological Survey.

The Middle anthracite coal field of Pennsylvania, including Hazleton and adjacent territory, is characterized by a number of comparatively small local basins quite in contrast with the large, deep coal deposits of the Lackawanna and Pottsville regions. In the Middle field the Mammoth seam, or "Big Vein," as it is known to the trade, reaches its greatest development, attaining a thickness of from 30 and 40 ft. up to 50 ft. and over in special cases. In most of the other anthracite fields of Pennsylvania, the Mammoth seam is split up into several distinct beds, to be mined as such.

It was natural in the early days of stripping coal, that operations should be much more limited than at present. In the days of competitive rate-cutting by the individual operators, coal sold occasionally for about cost of production. In those days it was considered good practice to remove a yard of dirt provided a yard of coal was thereby recovered. At some of the extensive present day anthracite strippings, 8 yd. of material is removed to obtain one yard of coal; and the material overlying the "pay coal" may consist of dirt, loose rock and solid rock.

It would be interesting to compare the relative cost per yard of stripping at the different periods, but exact figures are probably not readily obtainable. The first work of this kind was done by company men, but soon contractors undertook it on much the same basis as rail-

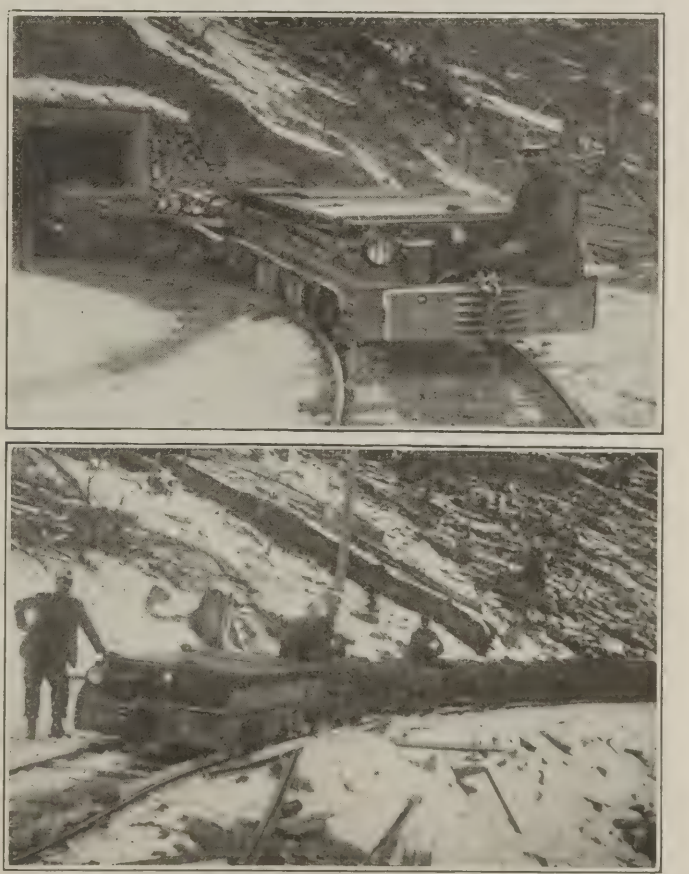
road excavation of a similar nature. Doubtless this comparison would throw some light on the subject. At several collieries at which the writer took up the stripping estimate each month, the prices were—dirt, 19c.; loose rock, 35c., and solid rock, 50c. per yard. The time referred to was about 1890.

The photograph from which the accompanying illustration was made was taken about this same time. It is interesting not only from a stripping point of view, but it also illustrates a typical Lehigh coal basin. The Mammoth seam stands out in bold relief in the center of the picture; the outcrop on the left can be traced almost to the slope of the breaker on the horizon; on the right the coal rises somewhat to an anticlinal and then pitches heavily, forming the north dip of the main Hazleton basin. The illustration shows the old No. 6 colliery of A. Pardee & Company.

In further explanation of this illustration it may be said that most of the "spoon" coal of this basin has been stripped and the coal sent to No. 6 breaker for preparation. Following closely on the foregoing operations is further work of a similar nature, the dirt bank of which is seen in the foreground at the left.

Thorough prospecting by a churn drill, operated by two or three men, frequently located large bodies of coal which were profitably stripped. This was especially true of the ends of basins and along the side crops, where the coal often folded over, flattened out and would likely have been lost by ordinary methods of mining.

It is a rather singular coincidence that while stripping in the Lehigh field started at the colliery of the Stout Coal Co., on the other hand probably the most extensive work of the kind in recent years is at the operation of the old Ebervale Coal Co. In the seventies these two collieries were under the same management and associated in the sense that the Stout interests were prominent stockholders in the Ebervale company. The latter property is now controlled by the Markle brothers, whose extensive strippings at this place are described in the Sept. 25, 1915, issue of *Coal Age*.



Legal Department

RESPONSIBILITY FOR HOISTING ENGINEER — An engineer employed at a mine to operate a cage in a shaft used in hoisting and lowering miners is to be regarded as a representative of the mine operator, and not a fellow servant of the miners in such sense as to absolve the mine owner from liability for injury sustained by a miner through such engineer's negligent operation of the hoist. It was manifestly negligent for the operator of an electric hoist to release it without using the brake or clutch, whereby the cage was dropped suddenly 110 ft., resulting in serious injury to plaintiff while riding on the cage for the purpose of going from a 500-ft. level to the 600-ft. level in defendant's mine, and the injured man is entitled to recover damages. (Utah Supreme Court, Farnon vs. Silver King Coalition Mines Co., 167 Pacific Reporter, 675.)

RISK ASSUMED BY COAL-CUTTING MACHINE OPERATOR—The operator of a coal cutting machine is not entitled to recover damages on account of injury sustained through the rear jack falling upon him while he was at work, where he knew as well as, or better than, any one else the defective condition of the machine and fully appreciated the danger to which he was exposed, voluntarily remaining at work for three months under such conditions, without any assurance from his superiors that the machine would be put in safe condition, although he had repeatedly taken the machine to the shop for repairs. (Kentucky Court of Appeals, Stonega Coke and Coal Co. vs. Bush, 197 Southwestern Reporter, 389.)

PUBLIC COAL LANDS—The fact that one was disqualified to hold title to public coal lands did not invalidate a title acquired by him from one who was so qualified and transferred to another who could lawfully receive it. And the fact that one has conveyed title to coal lands which have not yet been granted to him by the Government does not affect the validity of the conveyance, if he afterward obtains such grant, which will inure to the benefit of his grantee. (Utah Supreme Court, Ketchum Coal Co. vs. Pleasant Valley Coal Co., 168 Pacific Reporter, 86.)

RIGHT TO COMPEL CONVEYANCE UNDER CONTRACT—Although the courts will not compel specific performance of a contract to convey land where it appears that any degree of fraud has been practiced by the party who seeks performance, representations made to induce the owner of the surface of coal lands to convey his rights to the corporation which owned the coal, in exchange for stock in the company, concerning the profits which the company would probably earn, cannot be deemed to be such representations as to form the basis of fraud, they being mere matters of opinion. The stock issued to the grantor being worth about $3500, and the surface rights having been virtually valueless except for mining purposes, it cannot be said that the consideration for the conveyance is so inadequate as to deprive the corporation of the equitable right to a specific performance of the contract. (Kentucky Court of Appeals, Bartley vs. Big Branch Coal Co., 169 Southwestern Reporter, 601.)

IRONTON STORAGE BATTERY LOCOMOTIVE OWNED BY RAVEN COLLIERIES CO., RED ASH, VA.

Above—Locomotive coming out of company's No. 3 mine. Below—Same locomotive with a trip of loaded coal cars from No. 3 mine

Who's Who In Coal Mining

J. D. A. Morrow

BY THE application of horse sense and sound business methods, J. D. A. Morrow expects to get tangible results in the matter of coal distribution. Mr. Morrow has been designated by the Fuel Administration as manager of apportionment and distribution. Since all have agreed that distribution is the big problem to solve in the coal situation, Mr. Morrow has been thrust into a position hardly less important than that occupied by Dr. Garfield.

Mr. Morrow was associated intimately with Edward N. Hurley, now the chairman of the United States Shipping Board, when he was a member of the Federal Trade Commission. Mr. Hurley's ability to apply business methods to Government activities so impressed Mr. Morrow that he is thoroughly imbued with the same policy. He expects to work as if he were the general sales manager of a private company, and he expects to get private-company efficiency out of his organization.

J. D. A. MORROW

Practical coal man who has charge of apportionment and distribution of coal for the Federal Fuel Administration

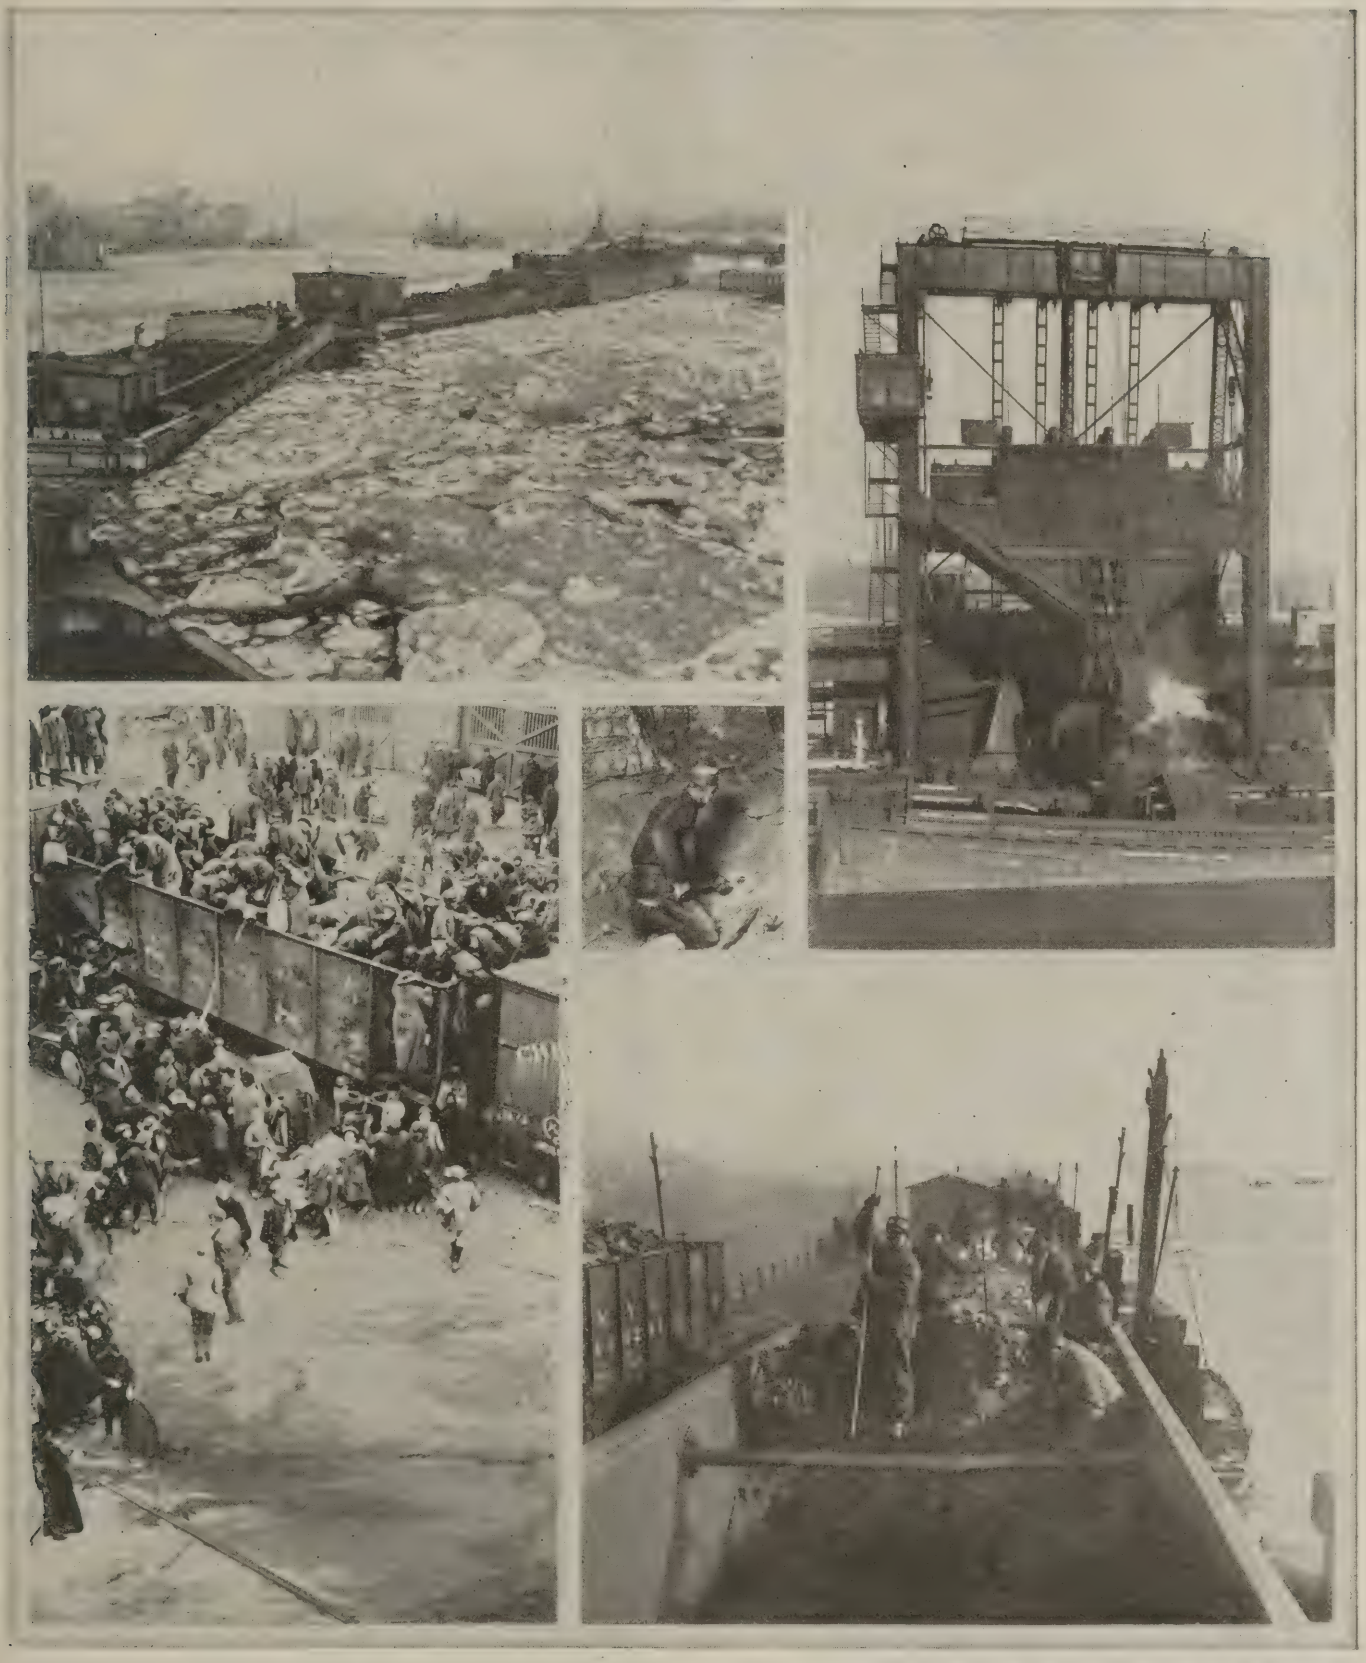
It was Mr. Morrow who started the Federal Trade Commission's bituminous coal investigation. In justice to Mr. Morrow, however, it must be stated that he simply initiated the work and is in no way responsible for the general pooling recommendation and the other suggestions made by the Federal Trade Commission in connection with that investigation.

Mr. Morrow was importantly connected with the investigation made by the Federal Trade Commission which led to its recommendation to Congress that American firms be allowed to coöperate in the conduct of foreign trade. This report resulted in the Webb bill.

Just at this time Mr. Morrow's whole attention is concentrated on preliminary arrangements for a drive for more efficient transportation conditions as they apply to the furnishing of cars to the mines. It is his hope to be able to build up an organization of coal distribution which soon will compare favorably with that of England and with that of Germany. Mr. Morrow is a graduate of Ohio Weslyan. He was born at Campbellstown, Ohio.

The Fuel Administration's announcement of Mr. Morrow's appointment reads as follows: "The United States Fuel Administration announces the appointment of J. D. A. Morrow to be manager of apportionment and distribution. This appointment is in accordance with the general plan of centralizing the authority and lines of report at headquarters. It is intended also to facilitate the introduction of the new plan of partial decentralization of apportionment and distribution without overburdening the present organization.

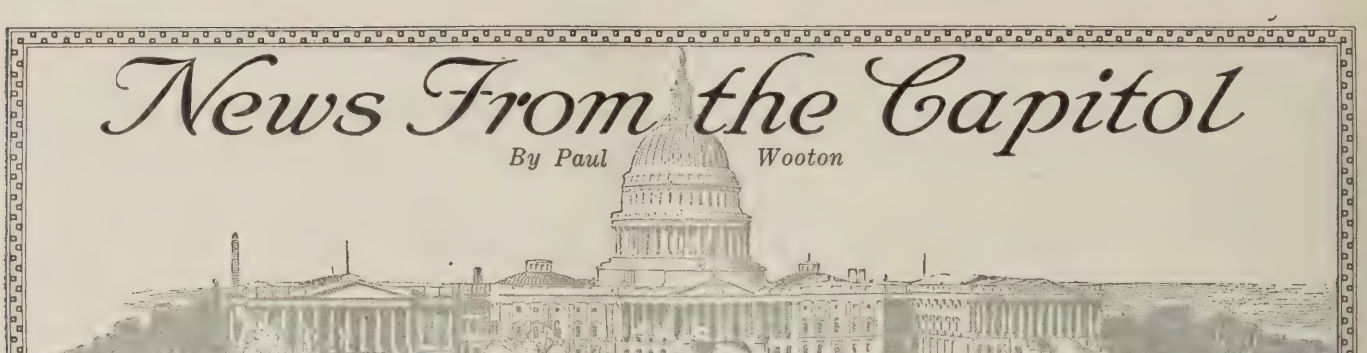
"Mr. Morrow will have general charge of the apportionment and distribution from producer to consumer of all fuel except petroleum. He will supervise all budgeting and statistical work, as well as pools and other transportation matters. He and the bureaus reporting to him will have no connection with the fixing of operators' base prices or retail prices, nor will he have authority or supervision over state administrators on matters other than apportionment and distribution.



"Mr. Morrow has been assistant secretary of the Federal Trade Commission, commissioner of the Pittsburgh Coal Producers Association and recently general secretary of the National Coal Association, representing the bituminous coal operators of the country."

Women Learn First Aid on Bureau of Mines Rescue Cars

With the wives of miners and other women members of mining committees as pupils, the United States Bureau of Mines has entered upon an active campaign to reduce casualties. Eight "mine-rescue cars," each with a crew of men highly trained in modern rescue methods, have been equipped and are making the rounds of the mining communities. Five hundred women have taken the course given and the bureau has been overwhelmed, since the declaration of war, with applications from women who wish to replace men on the cars.



Casualties in American mining have been large and the fatalities have been figured by the bureau at 3.30 for every thousand men engaged. According to reports from mine operators during the months in which the first-aid courses have been conducted, the loss of time from accidents has been materially reduced. The results of the campaign are also noticeable in the better school attendance of miners' children.

Before Coal Gets to the Ultimate Consumer

Photographs copyright Underwood & Underwood

The photographs on this page illustrate some of the things that happen to coal before it reaches the ultimate consumer. In the upper left is shown a string of barges plowing its way through the ice of New York Harbor during the recent cold spell; it was the first time in many years that the harbor had been practically frozen over, and this was one of the hindrances that intensified the coal shortage in New York City. In the lower left is shown a not unusual scene in railroad yards where cars loaded with coal were unable to be moved on account of congested transportation facilities. Many people, driven to desperation by the cold, came with carts, wagons and bags to carry the coal away. The view in the upper right is of one of the great modern coal dumps in use at large coal-distributing centers. The dump illustrated can turn over a car loaded with coal, emptying it at one stroke. This modern invention saves a great deal of labor and makes for great efficiency in the unloading of coal. In the lower right is a general view of a crew of men on top of some coal cars trying to loosen frozen coal by the aid of crowbars. The coal is frozen in huge lumps to the sides of the cars. Conditions such as these make it hard to speed up the movement of fuel to the places where it is most needed.

[Men of the coal industry who find it necessary to get to the national capital on business these days are invited to avail themselves of the facilities afforded by the Washington Bureau of "Coal Age," which is centrally located in the Union Trust Building. The bureau is in charge of Paul Wooton, who is in a position to be of material assistance to those who have business to transact with Government officials. Have your mail addressed care of "Coal Age," Room 307, Union Trust Building, Washington, D. C., while at the capital.—Editor.]

Weekly Production Statistics

Bituminous coal production was 10,018,000 tons, beehive coke production was 491,000 tons, and anthracite forwardings were 33,406 cars for the week ended Jan. 26, according to an estimate based on the returns from a high percentage of production made to the United States Geological Survey.

The coal production for the week, which averaged 1,670,000 tons per working day, still is much below normal and under the rate of production for the corresponding week of the year previous, but shows a decided improvement over production for the week preceding, when it was 8,566,000 tons.

Beehive coke production fell to the lowest point since June. The average per working day was 82,000 tons. During the week preceding, the average per working day was 88,000 tons, while during the week of Jan. 12 it was 94,000 tons.

Anthracite shipments, while somewhat greater than those during the week of Jan. 19, are still considerably below the normal forwardings.

Byproduct coke also reflects the depression in the coal industry, but not to the same extent as does beehive. Production during the week ended Jan. 19 was 319,524 tons. This is 65.9 per cent. of full-time capacity. Inability to secure coal, owing to transportation difficulties, is charged with 23.7 per cent. of the loss. This does not apply to Minnesota, where ample coal supply allowed continuous operation. In addition to cutting down the available coke so badly needed at steel mills, the reduction of output at byproduct plants decreases the badly needed supplies of ammonia, benzol and toluol.

Unfilled car orders at mines was the principal cause for the ratio of tonnage produced to full-time capacity. During that week, production fell to 55.8 per cent. of full-time capacity, or the lowest point reached since early in the year. The trouble to a considerable extent was the result of heavy snows. In Ohio, production fell to 40.3 per cent. of full-time capacity.

More District Representatives Appointed by Fuel Administrator

J. P. Cameron, of Altoona, Penn., has been designated as district representative of the Fuel Administrator for the coal fields of central Pennsylvania. With the announcement of Mr. Cameron's appointment, the names of the three assistant representatives who will work under him were made public.

John Lloyd, Jr., of Altoona, will be in immediate charge of coal produced at mines in Huntington and Bedford Counties; in that portion of Somerset County served by the Pennsylvania R.R., as well as the mines on the Pennsylvania between Crosson and Blairsville, and on the South Fork division and the Indiana branch.

Harry B. Scott, of Philipsburg, Penn., will be in direct charge of Center County, Cambria County (except that part coming under the jurisdiction of Mr. Lloyd), eastern part of Indiana County and all operations in Greenfield County tributary to the New York Central and Pennsylvania railroads.

Samuel A. Rinn, of Punxsutawney, will be in immediate charge of the producing district served by the Buffalo, Rochester & Pittsburgh R.R. in the western half of Indiana County; mines in Armstrong County served by the same railroad and by the Buffalo & Susquehanna R.R.; mines in Greenfield County tributary to the Buffalo, Rochester & Pittsburgh R.R.; mines in Jefferson, Elk, McKean, Cameron and Clinton Counties.

C. M. Roehrig, of Ashland, Ky., has been appointed district representative for the coal field comprised of the Counties of Boyd, Carter, Floyd, Johnson, Letcher and Pike (except the mines served by the Norfolk & Western Railway).

W. R. J. Zimmerman, of Charleston, W. Va., is district representative for the New River coal field in southern West Virginia, comprising operations on the Chesapeake & Ohio Ry. south and east of Hawks Nest, and all operations on the Virginian Railroad.

E. S. Howe, of Bluefield, W. Va., will be the district representative for the Tug River and Pocahontas coal fields in southern West Virginia and the Clinch Valley and Virginia anthracite fields in Virginia, comprising all operations on or tributary to the Norfolk & Western Ry. in West Virginia east of Panther, and embracing Mercer County and parts of McDowell and Wyoming Counties, West Virginia, and Tazewell, Montgomery, Pulaski and Russell (east of Coulwood on the N. & W.) Counties, Virginia.

Interstate Commerce Commission Allows Changes in Demurrage Rules

Changes in demurrage rules, regulations and charges, governing cars containing anthracite coal, bituminous coal or coke for transshipment by vessel, have been allowed, effective Feb. 10, by the Interstate Commerce Commission. The new regulations provide that:

Cars containing anthracite coal, bituminous coal or coke for transshipment direct by vessels, or to be stored for shipment by vessels when held for or by consignors or consignees for unloading, forwarding directions, or for any other purpose are subject to these rules except

a. Cars reconsigned or reshipped for rail delivery or to another rail destination will be subject to the National Car Demurrage Rules (Tariff I. C. C. No. ———) from arrival.

An average of three (3) days per car free time will be allowed.

A. A notice of arrival must be sent or given to the consignee in writing or as otherwise agreed to by carrier and consignee upon arrival of cars and billing at ———— (destination yard) ————.

Time will be computed from the first 7 a.m. after the day on which notice of arrival is sent or given to the consignee.

Note—In computing time Sundays and legal holidays (national, state and municipal), but not half-holidays, will be excluded. When a legal holiday falls on Sunday, the following Monday will be excluded.

B. A car shall be considered as released:

1. At the time vessel registers for the cargo or fuel supply of which the coal or coke dumped into such vessel is a part, except that when cars are unloaded before the vessel registers such cars shall be released when unloaded.

2. The date shipments are transferred by written order and acceptance to another party shall be considered the date of release of the car for the account of the original consignee and the detention shall follow the car and be charged in the account of the new consignee.

3. Any fraction of a day will be computed as one day.

Settlement shall be made on basis of the detention to all cars released during each month. The date of arrival notice shall be subtracted from the date of release. From the total days detention to all cars thus obtained deduct three days' free time allowance for each car; the remainder, if any, will be the number of days to be charged at the rate of $3 per car per day. Excess credit days of any month can not be deducted from excess debit days of another month.

Exceptions at Lake Ports: (1) Cars released during April and May shall be considered as May detention and treated as one month. (2) The season of navigation shall be considered as extending from April to December. Loaded cars on hand at the close of navigation will be recorded released on that date in computing the average detention and subsequent detention will be subject to the National Car Demurrage Rules, as per Tariff I. C. C. No. ———.

Bureau of Internal Revenue To Issue Income Tax Regulations

Regulations governing the administration of the income-tax law are about to be issued by the Bureau of Internal Revenue. The rulings relating to depletion in mining properties and to dividend payments from depreciation and depletion reserves are among the more important. With regard to mining corporations, it is stated that in passing on values, as of Mar. 1, 1913, as a basis for depletion, the Commissioner of Internal Revenue will give due weight to market quotations of capital stock as of that date and to values stated by the corporations in their capital stock returns. It is held that dividends paid of depletion or depreciation reserves are in the nature of a liquidation dividend and are a return of capital to the stockholder and not taxable as income. Such dividends will not be so regarded, however, unless the income and surplus first have been distributed and the fact that their capital has been reduced or partly returned is made public in their published statements.

A ruling has been provided for computing the amount necessary to return capital invested in oil and gas wells. The rule is based upon estimate of the units contained in the property, and fee owners and lessees are placed upon the same basis in so far as bonuses actually have been paid for leases.

State Fuel Administrators Must Conform to Washington Regulations

Some confusion is resulting, due to the inequalities in the administration of various restrictive regulations issued by the Fuel Administration. To prevent this, state fuel administrators have been instructed to conform to the regulations as promulgated in Washington. This, it is believed, will prevent the inequalities in the requirements of different communities. Some latitude is left to state administrators to cope with local conditions, but it is expected that most of the additional regulations, which have been issued by the state administrators, will be revoked. In some cases these additional regulations have resulted in inconvenience to the public, which is said to be out of all proportion to the saving of fuel effected.

"Most Expensive Coal Purchase in Country," Says Senator from Michigan

Only six tons of coal were saved at 37 furniture factories at Grand Rapids, Mich., on each of the fuelless Mondays, according to a statement made by Senator Smith, of Michigan, on the floor of the Senate. In part, he said:

I wish to say, if the chair will indulge me, that the most expensive coal purchase in the United States on any day was purchased in my home city of Grand Rapids, where six tons of coal cost over $22,000. The consumption capacity of the city of Grand Rapids, Mich., with 135,000 people, is 3000 tons of coal a day. Monday 37 of the leading furniture industries of that city, and the leading furniture center in the world, were closed down by order of the Fuel Administration to save six tons of coal that could be carried upon two wagons. It would have taken, by a very careful and painstaking review among our factories, six tons of coal more to have operated 37 factories in the city of Grand Rapids Monday than it took to close them down, and nearly 8000 workmen were put into the streets on that day, and their wages wasted by Government order. That is a high price to pay for coal in the United States; a tremendous sacrifice for labor to make in order to humor a caprice, a mere caprice. If that is wisdom, I do not understand it. No, Mr. President, it is reckless indifference to individual liberty and the rights of citizenship.

I rise in my capacity as a Senator to protest against the sacrifice of labor and of business to the whims of a Fuel Administrator who will not see his error. Think of it, sir! Thirty-seven great furniture-manufacturing plants closed down a whole day to save six tons of coal! And in the nine idle days that are to follow, if this order stands, 54 tons of coal—scarcely a carload—will be saved and over $250,000 in wages to workmen lost.

At a conference between McAdoo and Garfield on Tuesday it was decided not to withdraw the order for workless Mondays for the present.

THE LABOR SITUATION

General Labor Review

The outstanding event of the last two weeks is the decision of the operators in Alabama to accept the provisions of the agreement written by Rembrandt Peale, the representative of the bituminous operators in Mr. Garfield's "cabinet." The mine workers signified their approval of it Dec. 21 of last year, and on Jan. 12 the Fuel Administration demanded that the operators signify their accession to its terms. The contract will be found in abstract on pages 152 and 153 of this volume.

The operators object to taking men into their employ who they say never worked for them and only joined the union to prey upon it and upon the mine operator. The operators say that they will not recognize the union. The contract accepted does not involve this recognition, but it establishes committees of workmen such as will almost inevitably be union organizations. Alabama is to all intents and purposes unionized. The wage question is regarded as of less importance by the operators. They say they will raise wages if they find it necessary to do so in order to maintain production.

Trouble with the Laflin "I Won't Works"

The strike of the mine workers of the Traders Coal Co., at Ridgewood near Laflin, Luzerne County, Pennsylvania, is approaching an end. On Jan. 30 half the men on strike went back to work. The mine has normally about 500 employees. As stated last week in the General Labor Review, over half these went on strike because the superintendent could not lower the men into the mine owing to the late arrival of the engineer. The mine workers demanded the discharge of the foreman, T. J. Conway.

Between Wilkes-Barre and Scranton on the southern edge of the northern anthracite field are some towns inhabited by "willful men." In these villages trouble seems chronic. Not even the war seems entirely able to make these men give up their striking propensity. The towns particularly affected have been Dupont, Laflin, Avoca, Moosic, Inkerman and Forty Fort.

Union Is Not To Blame for This Strike

At one time it was seriously proposed to arrest the ringleaders under a charge of helping the enemy, but when some of the men returned to work the intention was given up. Many of the men are Italians and Industrial Workers of the World. The strike cannot be charged to the United Mine Workers of America.

There have been several attempts to make trouble in central Pennsylvania. On Jan. 31 John Homick, of Winber, was arrested and a warrant was issued for Andy Janacz, also of Winber, the charge being that they endeavored to induce Austrians to quit work and naturalized Austrians to refuse to join the United States Army. Janacz is critically ill in the Winber Hospital and so has merely been put under surveillance.

Serbians and Turks Fight Battle To Death

Another evidence of the reaction of the war on industry was at Edna No. 1 of the United Coal Corporation. At this mine, which is near Adamsburg, Westmoreland County, Pennsylvania, two Serbians had, on Jan. 22, a fight with three Turks. One Turk was killed and the other two wounded. The Serbians escaped victorious.

The miners at a small mine (37 men only) at Denning, Ark., have written to Dr. H. A. Garfield complaining of the inadequate equipment of mine No. 2 of the McGraw Coal Co., at which they work. This company is a subsidiary of the Western Coal and Mining Co. The men say that at the Denning Coal Co.'s mine and that of the Douglas Coal Co. the output of each miner is nine tons, whereas at the two openings of the McGraw concern the tonnage is only five tons, though the coal is of the best.

The miners ask for more company men and more mine cars. There are only 13 for 37 men, and they have been in use, the men say, for 20 years. The men offer to work on Sunday, if necessary, to "do their bit." They are, they say, "as patriotic as" they "know how to be."

Though the mine is small, the protest is worth recording. The anxiety of the men to work, their impatience with inefficiency, their readiness to submit to every inconvenience to do their part in the work of supporting the nation shows that we do wrong when we generalize about the great Southwest. Apologies from the editor of this department may yet be in order. By the way, these are union men—Local Union No. 1814.

It is reported that the Nova Scotia Steel Co. succeeded in making a satisfactory settlement with the men at its Jubilee mine when representatives of the miners and the company met with R. W. Crothers, the representative of the Canadian government. The company will pay the miners a regular contract rate for each ton mined. The miners are not members of the United Mine Workers of America as are those in western Canada. Their union is known as the Amalgamated Mine Workers, Silby Barrett being president and J. D. MacLachlan, secretary-treasurer.

White "Passes the Buck" to Operators

Little stock is taken by John P. White, former president of the United Mine Workers, but now a member of the Fuel Administrator's staff, in the cry that has been raised against dirty coal. It is Mr. White's opinion that it shows poor judgment on the part of mine operators especially, to be making extravagant claims regarding the amount of noncombustible matter contained in coal being shipped under the President's prices, which make no provision for a higher price for coal that has passed through a washery.

Mr. White says that if any considerable increase has taken place in the amount of noncombustible matter being marketed it is the fault of the operator. In this connection he pointed to the resolution regarding the penalties for loading impurities, which is a part of practically every agreement entered into between mine operators and their employees. This resolution, which is substantially the same, in all fields, reads as follows:

(a). Both the miners and operators realizing the importance of getting clean coal, to insure the sale of same, it is mutually understood and agreed that the miners and loaders will produce their coal in such a manner as not to increase the percentage of fine coal either by carelessness or reckless shooting, and will load the coal free from impurities as nearly as possible.
